Poland. second article guaranteed to the nobility or the equestrian order, all the privileges which it enjoyed under the kings of the house of Jagellan. The third and fourth articles granted to the free royal towns internal jurisdictions of their own; and exempted the peasants from slavery, declaring every man free as soon as he sets his foot on the territory of the republic. The fifth article, after declaring, that in civil society all power should be derived from the will of the people, enacted that the government of the Polish nation should be composed of three distinct powers, the *legislative*, in the states assembled; the *executive*, in the king and the council of inspection; and the *judicial* power, in the jurisdictions existing, or to be established. The sixth and seventh articles, as being of more importance, we shall give in the words of the constitution itself.

127
The diet to consist of two houses, viz. the house of nuncios,

VI. *The Diet, or the legislative power*, shall be divided into two houses, viz. the house of nuncios, or deputies, and the house of senate, where the king is to preside. The former being the representative and central point of supreme national authority, shall possess the pre-eminence in the legislature; therefore all bills are to be decided first in this house.

1. *All General Laws*, viz. constitutional, civil, criminal, and perpetual taxes; concerning which matters, the king is to issue his propositions by the circular letters sent before the dietines to every palatinate and to every district for deliberation, which coming before the house with the opinion expressed in the instructions given to their representatives, shall be taken the first for decision.

2. *Particular Laws*, viz. temporal taxes; regulations of the mint; contracting public debts; creating nobles, and other casual recompenses; reparation of public expences, both ordinary and extraordinary; concerning war; peace; ratification of treaties, both political and commercial; all diplomatic acts and conventions relative to the laws of nations; examining and acquitting different executive departments, and similar subjects arising from the accidental exigencies and circumstances of the state; in which the propositions, coming directly from the throne into the house of nuncios, are to have preference in discussion before the private bills.

128
And the house of senate.

In regard to the house of senate, it is to consist of bishops, palatines, castellans, and ministers, under the presidency of the king; who shall have but one vote, and the casting voice in case of parity, which he may give either personally, or by a message to the house. Its power and duty shall be,

1. Every general law that passes formally through the house of nuncios, is to be sent immediately to this, which is either accepted, or suspended, till farther national deliberation, by a majority of votes, as prescribed by law. If accepted, it becomes a law in all its force; if suspended, it shall be resumed at the next diet; and if it is then agreed to again by the house of nuncios, the senate must submit to it.

3. Every particular law or statute of the diet in matters above specified, as soon as it has been determined by the house of nuncios, and sent up to the senate, the votes of both houses shall be jointly computed, and the majority, as described by law, shall be considered as a decree and the will of the nation. Those senators and ministers who, from their share in executive power, are accountable to the republic, cannot have an active voice

VOL. XV.

Poland. in the diet, but may be present, in order to give necessary explanations to the states.

These ordinary legislative diets shall have their uninterrupted existence, and be always ready to meet; renewable every two years. The length of sessions shall be determined by the law concerning diets. If convened out of ordinary session upon some urgent occasion, they shall only deliberate on the subject which occasioned such a call, or on circumstances which may arise out of it.

No law or statute enacted by such ordinary diet can be altered or annulled by the same. The complement of the diet shall be composed of the number of persons in both houses to be determined hereafter.

The law concerning the dietines or primary elections, as established by the present diet, shall be regarded as a most essential foundation of civil liberty.

The majority of votes shall decide every thing, and everywhere; therefore we abolish, and utterly annihilate, *liberum veto*, all sorts of confederacies and confederate diets, as contrary to the spirit of the present constitution, as undermining the government, and as being ruinous to society.

Willing to prevent, on one hand, violent and frequent changes in the national constitution, yet, considering on the other, the necessity of perfecting it, after experiencing its effects on public prosperity, we determine the period of every 25 years for an extraordinary constitutional diet, to be held purposely for the revision and such alterations of the constitution as may be found requisite: which diet shall be circumscribed by a separate law hereafter.

VII. The most perfect government cannot exist or last without an effectual executive power. The happiness of the nation depends on just laws, but the good effects of laws flow only from their execution. Experience has taught us, that the neglecting this essential part of government has overwhelmed Poland with disasters.

Having, therefore, secured to the free Polish nation the right of enacting laws for themselves, the supreme inspection over the executive power, and the choice of their magistrates, we entrust to the king and his council the highest power of executing the laws. This council shall be called *straz*, or the council of inspection.

The duty of such executive power shall be to watch over the laws, and to see them strictly executed according to their import, even by the means of public force should it be necessary. All departments and magistracies are bound to obey its directions. To this power we leave the right of controuling such as are refractory, or of punishing such as are negligent in the execution of their respective offices.

This executive power cannot assume the right of making laws, or of their interpretation. It is expressly forbidden to contract public debts; to alter the repartition of the national income, as fixed by the diet; to declare war; to conclude definitively any treaty, or any diplomatic act; it is only allowed to carry on negotiations with foreign courts, and facilitate temporary occurrences, always with reference to the diet.

The crown of Poland we declare to be elective in regard to families, and it is settled so for ever.

Having experienced the fatal effects of interregna, periodically

Poland.

129
The liberum veto abolished.

130
Extraordinary diet for revising the constitution.

131
Powers of the king and council of inspection.

132
Crown elective in regard to families;

- Poland.** periodically subverting government, and being desirous of preventing for ever all foreign influence, as well as of insuring to every citizen a perfect tranquillity, we have, from prudent motives, resolved to adopt hereditary succession to our throne: therefore we enact and declare, that, after the expiration of our life, according to the gracious will of the Almighty, the present elector of Saxony shall reign over Poland, and in his person shall the dynasty of future kings of Poland begin. We reserve to the nation, however, the right of electing to the throne any other house or family, after the extinction of the first.
- 133** But hereditary in each family till its extinction.
- 134** Coronation oath.
- Every king, on his accession to the throne, shall take a solemn oath to God and the nation, to support the present constitution, to fulfil the *pacta conventa*, which will be settled with the present elector of Saxony, as appointed to the crown, and which shall bind him in the same manner as former ones.
- 135** King's person sacred:
- The king's person is sacred and inviolable; as no act can proceed immediately from him, he cannot be in any manner responsible to the nation; he is not an absolute monarch, but the father and the head of the people; his revenues, as fixed by the *pacta conventa*, shall be sacredly preserved. All public acts, the acts of magistracies, and the coin of the kingdom, shall bear his name.
- 136** His particular powers.
- The king, who ought to possess every power of doing good, shall have the right of pardoning those that are condemned to death, except the crimes be against the state. In time of war, he shall have the supreme command of the national forces: he may appoint the commanders of the army, however, by the will of the states. It shall be his province to patent officers in the army, and other dignitaries, consonant to the regulations hereafter to be expressed, to appoint bishops, senators, and ministers, as members of the executive power.
- 137** Members of the council of inspection.
- The king's council of inspection is to consist, 1. Of the primate, as the head of the clergy, and the president of the commission of education, or the first bishop *in ordine*. 2. Of five ministers, viz. the minister of police, minister of justice, minister of war, minister of finances, and minister for the foreign affairs. 3. Of two secretaries to keep the protocols, one for the council, another for the foreign department; both, however, without decisive vote. The hereditary prince coming of age and having taken the oath to preserve the constitution, many assist at all sessions of the council, but shall have no vote therein. The marshal of the diet, being chosen for two years, has also a right to sit in this council, without taking any share in its resolves; for the end only to call together the diet, always existing, in the following case: should he deem, from the emergencies hereunder specified, the convocation of the diet absolutely necessary, and the king refusing to do it, the marshal is bound to issue his circular letters to all nuncios and senators, adducing real motives for such meeting.
- 138** Powers of the marshal.
- The cases demanding such convocation of the diet are the following: 1. In a pressing necessity concerning the law of nations, and particularly in case of a neighbouring war. 2. In case of an internal commotion, menacing with the revolution of the country, or of a collision between magistratures. 3. In an evident danger of general famine. 4. In the orphan state of the country, by demise of the king, or in case of the king's dangerous illness. All the resolutions of the council of inspection are to be examined by the rules abovementioned. The king's opinion, after that of every member in the council has been heard, shall decisively prevail. Every resolution of this council shall be issued under the king's signature, countersigned by one of the ministers sitting therein; and thus signed, shall be obeyed by all executive departments, except in cases expressly exempted by the present constitution.
- Should all the members refuse their countersign to any resolution, the king is obliged to forego his opinion; but if he should persist in it, the marshal of the diet may demand the convocation of the diet; and if the king will not, the marshal himself shall send his circular letters as above. Ministers composing this council cannot be employed at the same time in any other commission or department.
- If it should happen that two thirds of secret votes in both houses demand the changing of any person either in the council, or any executive department, the king is bound to nominate another. Willing that the council of inspection should be responsible to the nation for their actions, we decree, that when these ministers are denounced and accused before the diet (by the special committee appointed for examining their proceedings) of any transgression of positive law, they are answerable with their persons and fortunes. Such impeachments being determined by a simple majority of votes, collected jointly from both houses, shall be tried immediately by the comitial tribunal, where the accused are to receive their final judgment and punishment, if found guilty; or to be honourably acquitted on sufficient proof of innocence.
- In order to form a necessary organization of the executive power, we establish hereby separate commissions, connected with the above council, and subjected to obey its ordinations. These commissions are, 1. of education; 2. of police; 3. of war; 4. of treasury. It is through the medium of these four departments that all the particular orderly commissions (d), as established by the present diet, in every palatinate and district, shall depend on, and receive all orders from, the council of inspection, in their respective duties and occurrences.
- The eighth article regulates the administration of justice, beginning with a very sensible declaration, that the judicial power is incompatible with the legislative, and that it cannot be administered by the king. It therefore constitutes primary courts of justice for each palatinate or district, composed of judges chosen at the diet; and appoints higher tribunals, erected one in each of the three provinces into which the kingdom is divided, with which appeals may be lodged from the primary
- Poland.**
- 139** Commissions of education, police, &c.
- 140** Administration of justice.

(d) Orderly commissions are newly instituted; each palatinate and district chooses a certain number of commissaries; their office lasts two years; their principal duty is to maintain police and good order in their district; to put into execution decrees and regulations of supreme departments; to collect taxes; to keep cash; to make such payments as assigned by the commission of finances; to protect citizens from the military oppression; to furnish recruits, besides many other duties of internal management.

Poland. many courts. It appoints likewise for the trial of persons accused of crimes against the state, one supreme general tribunal for all classes, called a *comitial tribunal* or court, composed of persons chosen at the opening of every diet. The ninth article provides a regency during the king's minority, in case of his settled alienation of reason, or upon the emergency of his being made a prisoner of war. This regency was to be composed of the council of inspection, with the queen at their head, or, in her absence, the primate of the kingdom. The tenth article enjoins, that the education of the king's sons shall be entrusted to the king with the council, and a tutor appointed by the states; and the eleventh regulates the army in such a manner, as to prevent it from being employed to overturn the constitution.

141
Regency
on certain
occasions.

142
The elec-
tion and
duties of
nuncios.

The regulation of the dietines contains nothing that can be interesting to our readers, except what relates to the election and duties of nuncios or representatives to the general diet. And here it is enacted, that persons having a right to vote are all nobles of the equestrian order; *i. e.* 1. All hereditary proprietors of landed property, or possessed of estates by adjudication for a debt, paying territorial tax to government: sons also of such proprietors during the life of their parents, before the ex-division of patrimony. 2. Brothers inheriting estates before they have shared their succession. 3. All mortgages who pay 100 florins (50 shillings) of territorial tax per year from their possessions. 4. All life-holders of lands paying territorial tax to the same amount. 5. All nobles in the army possessed of such qualifying estates have a vote in their respective districts in time of peace, and properly furloughed by their commanders. 6. Legal possession is understood to be qualifying when it has been formerly acquired and actually enjoyed for twelve calendar months previously.

Persons who have no right to vote are, 1. Those of the equestrian order that are not actually possessed of a property, as described in the foregoing article. 2. Such as hold royal, ecclesiastical, or noble lands, even with right of inheritance, but on condition of some duty or payment to their principals, consequently dependent thereon. 3. Gentry possessing estates on feudal tenure, called *ordynackie*, as being bound to certain personal service thereby. 4. All renters of estates that have no other qualifying property. 5. Those that have not accomplished 18 years of age. 6. *Crimine notati*, and those that are under a decree passed in default, even in the first instance, for having disobeyed any judicial court.

143
Persons e-
ligible and
not eli-
gible.

Every person of the equestrian order that pays territorial tax to government for his freehold, let it be ever so small, is eligible to all elective offices in his respective district.

Gentlemen actually serving in the army, even possessed of landed hereditary estate, must have served six complete years before they are eligible to the office of a nuncio only. But this condition is dispensed with in favour of those that have filled before some public function.

Whoever is not personally present at the dietine; whoever has not completed 23 years of age; whoever has not been in any public function, nor passed the biennial office of a commissary in the orderly commission; those that are not exempted by law from obligations of *securta bellatus*, which subjects all newly nobilitated per-

Poland. sons to certain civil restrictions until the next generation; and, lastly, all those against whom may be objected a decree in *contumaciam* in a civil cause; are not eligible.

During the business of election, the president who opened the meeting, with the rest of the committee, except those who are assessors, shall prepare instructions for procedure; and in regard to the propositions sent by the king and the council of inspection, these instructions shall be worded thus: "Our nuncios shall vote *affirmative* to the article *N*;" or, "Our nuncios shall vote *negative* to the article *N*;" in case it is found contrary to the opinion of the dietine: and should any amendment or addition be deemed necessary and agreed on, it may be inserted in the instructions at the end of the relative proposition.

144
Instruc-
tions to the
nuncios,

At the meeting of the dietines, after the diet has sat, the nuncios are bound to appear before their constituents, and to bring their report of the whole proceedings of that assembly; first, respecting the acts of legislature; next, with respect to the particular projects of their palatinate or district recommended to them by the instructions.

145
Who are
account-
able to
their con-
stituents,

It is at these dietines that nuncios, after they have rendered to their constituents a clear account of their proceedings and of the diet, may be either confirmed or changed, and new ones elected in their stead till the general election for the following ordinary diet.

New nuncios are chosen, 1. In the room of the deceased. 2. In the room of those that are become senators or ministers of state. 3. In case of resignation. 4. In the room of such as are disqualified by the diet. 5. When any of the assembly desires a new election, to substitute another nuncio in the room of one expressly pointed out; which request must be made in writing, signed by 12 members besides, and be delivered to the marshal of the dietine. In this last case, the marshal is to read the name of the nuncio objected to, and to make the following proposition: "Shall the nuncio *N* be confirmed in his function? or, Shall there be a new election made in his stead?" The opinion of the meeting being taken by a division, the majority shall decide the question, and be declared by the marshal. If the majority approves the conduct of the nuncio, the marshal and the assessors shall certify this confirmation on the diploma; and in case of disapprobation, the marshal shall declare the vacancy, and begin the form of a new election.

Such are the outlines of the Polish constitution established by the king and the confederates in 1791. It will not bear a comparison with that under which we have the happiness to live; but it is surely infinitely superior to that motley form of government which for a century past, has rendered Poland a perpetual scene of war, tumult, tyranny, and rebellion. Many of the corrupt nobles, however, perceiving that it would curb their ambition, deprive them of the base means which they had long enjoyed of gratifying their avarice by setting the crown to sale, and render it impossible for them to continue with impunity their tyrannical oppression of the peasants, protested against it, and withdrew from the confederates. This was nothing more than what might have been expected, or than what the king and his friends undoubtedly did expect. But the malcontents were not satisfied with a simple protest; they preferred their complaints to the empress of Russia,

147
And op-
posed by
the Rus-
sians.

Poland, who, ready on all occasions, and on the slightest pretence, to invade Poland, poured her armies into the republic, and surrounding the king and the diet with ferocious foldiers, compelled them, by the most furious and indecent menaces, to undo their glorious labour of love, and to restore the constitution as settled after the partition treaty.

Of the progress of the Russians in this work of darkness, our readers will be pleased with the following manly and indignant narrative, taken from a periodical work * of acknowledged merit.

* New An-
nual Regi-
ster, 1792.

"It was on the 21st of April 1792, that the diet received the first notification from the king, of the inimical and unjust intentions of Russia. He informed them that, without the shadow of pretence, this avowed enemy of the rights of mankind had determined to invade the territory of the republic with an army of 60,000 men. This formidable banditti, commanded by generals Soltikow, Michelson, and Kosakowski, was afterwards to be supported by a corps of 20,000 and by the troops then acting in Moldavia, amounting to 70,000. The king, however, professed that he was not discouraged, and declared his readiness to put himself at the head of the national troops, and to terminate his existence in a glorious contest for the liberties of his country. Then, and not before, the diet decreed the organization of the army, and its augmentation to 100,000. The king and the council of inspection were invested with unlimited authority in every thing that regarded the defence of the kingdom. Magazines were ordered to be constructed when it was too late, and quarters to be provided for the army.

148
The nation
rises to
maintain its
independ-
ence.

"The diet and the nation rose as one man to maintain their independence. All private animosities were obliterated, all private interests were sacrificed; the greatest encouragements were held forth to volunteers to enroll themselves under the national standard, and it was unanimously decreed by the diet, that all private losses should be compensated out of the public treasury.

"On the 18th of May, the Russian ambassador delivered a declaration, which was worthy of such a cause. It was a tissue of falsehood and hypocrisy. It asserted, that this wanton invasion, which was evidently against the sense of almost every individual Polishman, was meant entirely for the good of the republic. It censured the precipitancy with which the new constitution was adopted, and ascribed the ready consent of the diet to the influence of the Warsaw mob. It represented the constitution as a violation of the principles on which the Polish republic was founded—complained of the licentiousness with which the *sacred name of the empress* was treated in some speeches of the members; and concluded by professing, that on these accounts, and in behalf of the emigrant Poles, her imperial majesty had ordered her troops to enter the territories of the republic.

149
Spirit of
the nobi-
lity.

"At the moment this declaration was delivered to the diet, the Russian troops, accompanied by counts Potocki, Rzewuski, Branicki, and a few Polish apostates, appeared upon the frontiers, and entered the territories of the republic in several columns, before the close of the month. The spirit manifested by the nobility was truly honourable. Some of them delivered in their plate to the mint. Prince Radzvil engaged voluntarily to furnish 10,000 stand of arms, and another a train of artillery. The

courage of the new and hastily embodied foldiers corresponded with the patriotism of their nobles. Prince Poniatowski, nephew to the king, was appointed commander in chief; and though his force was greatly inferior to the enemy, it must be confessed that he made a noble stand. On the 24th of May, the enemy's Cossacks were repulsed, and pursued by the patrols of the republic to the very entrenchments. On the 26th, about one o'clock, the piquets of the republic discovered a large body of Don Cossacks approaching the outposts; and a squadron of cavalry, commanded by Lieutenant Kwafniewski, supported by Lieutenant Golejowski with two squadrons more, in all about 300, marched out to meet them. They attacked the Cossacks with success, but pursued them with more valour than prudence to the side of a wood, where they found themselves drawn into an ambuscade, and surrounded by 2000 horse, two battalions of chasseurs, and six pieces of cannon. The intrepid Poles bravely fought their way through the Russian line, and killed upwards of 200 of the enemy. The Poles in this engagement lost 100 men and two officers; one of whom, Lieutenant Kwafniewski, was wounded and made prisoner. The remainder of the detachment reached their quarters in safety.

"Perhaps the history of man can scarcely furnish an instance of perfidy, meanness, and duplicity, equal to that which was manifested by Prussia on this occasion. By the treaty of defensive alliance, solemnly contracted between the republic of Poland and the king of Prussia, and ratified on the 23d of April 1790, it is expressly stipulated, 'That the contracting parties shall do all in their power to guarantee and preserve to each other reciprocally the whole of the territories which they respectively possess: That, in case of menace or invasion from any foreign power, they shall assist each other with *their whole force*, if necessary:—and by the sixth article, it is further stipulated, 'that if any foreign power whatever shall presume to interfere in the internal affairs of Poland, his Prussian majesty shall consider this as a case falling within the meaning of the alliance, and shall assist the republic according to the tenor of the fourth article,' that is, with his *whole force*. What then is the pretext for abandoning this treaty? It is, that the *empress of Russia has shown a decided opposition to the order of things established in Poland on the third of May 1791, and is provoked by Poland presuming to put herself into a posture to defend it.*—It is known, however, by the most authentic documents, that nothing was effected on the third of May 1791, to which Prussia had not previously assented, and which she did not afterwards sanction; and that Prussia, according to the assertion of her own king, did not intimate a single doubt respecting the revolution till one month (and according to the Prussian minister till six months) after it had taken place; in short, to use the monarch's own words as fully explanatory of his double politics, "not till the *general tranquillity of Europe* permitted him to explain himself."—Instead, therefore, of assisting Poland, Prussia insultingly recommended to Poland to retrace her steps; in which case, she said that she would be ready to *attempt an accommodation* in her favour. This attempt was never made, and probably never intended; for the empress pursued her measures.

The duchy of Lithuania was the great scene of action in the beginning of the war; but the Russians had made little

Poland.
151
War with
Russia,

little progress before the middle of the month of June. On the 10th of that month, General Judycki, who commanded a detachment of the Polish troops, between Mire and Świerzna, was attacked by the Russians; but, after a combat of some hours, he obliged them to retire with the loss of 500 men dead on the field.—The general was desirous of profiting by this advantage, by pursuing the enemy, but was prevented by a most violent fall of rain. On the succeeding day, the Russians rallied again to the attack; and it then too fatally appeared, that the Poles were too young and undisciplined to contend with an inferior force against experienced troops and able generals. By a masterly manœuvre, the Russians contrived to surround their antagonists, at a moment when the Polish general supposed that he had obliged the enemy to retreat; and though the field was contested with the utmost valour by the troops of the republic, they were at length compelled to give way, and to retire towards Niewieź.

On the 14th another engagement took place near Lubar on the banks of the river Sluez, between a detachment of the Russian grand army and a party of Polish cavalry, dispatched by Prince Joseph Poniatowski, to intercept the enemy. The patriotic bravery of the Poles was victorious in this contest; but upon reconnoitering the force of the enemy, the prince found himself incapable of making a successful stand against such superior numbers. He therefore gave orders to strike the camp at Lubar, and commenced a precipitate retreat. During their march, the Polish rear was harassed by a body of 4000 Russians, till arriving at Boruszkowee, the wooden bridge unfortunately gave way, under the weight of the cavalry. The enemy, in the mean time, brought their artillery to play upon the rear of the fugitives, who lost upwards of 250 men. The Polish army next directed its course toward Zielime, where meeting, on the 17th, with a reinforcement from Zaslów, it halted to give battle to the enemy. The Russians were upwards of 17,000 strong, with 24 pieces of cannon, and the force of the republic much inferior. After a furious contest from seven in the morning till five in the afternoon, the Russians were at length obliged to retreat, and leave the field of battle in possession of the patriots. The Russians were computed to have lost 4000 men in this engagement, and the Poles about 1100.

Notwithstanding these exertions, the Poles were obliged gradually to retire before their numerous and disciplined enemies. Niewieź, Wilna, Minsk, and several other places of less consequence, fell into their hands one after another. On a truce being proposed to the Russian general Kochowski, the proposal was haughtily rejected; while the desertion of vice brigadier Rudnicki and some others, who preferred dishonour to personal danger, proclaimed a tottering cause. The progress of the armies of Catharine was marked with devastation and cruelty, while, such was the aversion of the people both to the cause and the manner of conducting it, that, as they approached, the country all around became a wilderness, and scarcely a human being was to be seen.

In the mean time, a series of little defeats, to which the inexperience of the commanders, and the intemperate valour of new raised troops, appear to have greatly contributed, served at once to distress and to dispirit

these defenders of their country. Prince Poniatowski continued to retreat, and on the 17th of July, his rear being attacked by a very superior force, it suffered a considerable loss, though the skill and courage of General Kosciuszko enabled him to make a most respectable defence. On the 18th, a general engagement took place between the two armies. The Russian line extended opposite Dubienka, along the river Bog, as far as Opalin. The principal column, consisting of 14,000 men, was chiefly directed against the division of General Kosciuszko, which consisted of 5000 men only. After a most vigorous resistance, in which the Russians lost upwards of 4000 men, and the troops of the republic only some hundreds, the latter was compelled to give way before the superior numbers of the enemy, and to retire further into the country.

This unequal contest was at last prematurely terminated. The king, whose benevolent intentions were, perhaps, overpowered by his mental imbecillity, and whose age and infirmities, probably, rendered him unequal to the difficulties and dangers which must attend a protracted war, instead of putting himself, according to his first resolve, at the head of his army, determined, at once, to surrender at discretion. On the 23d of July, he summoned a council of all the deputies at that moment in Warsaw. He laid before them the last dispatches from the empress, which insisted upon total and unreserved submission. He pointed out the danger of a dismemberment of the republic, should they delay to throw themselves upon the clemency of the empress, and to intreat her protection. He mentioned the fatal union of Austria and Prussia with Russia; and the disgraceful supineness manifested by every other court in Europe.

Four citizens, the intrepid and patriotic Malachowski, the princes Sapieha, Radzvil, and Soltan, vehemently protested against these dastardly proceedings; and the following evening a company of gentlemen from the different provinces assembled for the same purpose. The assembly waited immediately on these four distinguished patriots, and returned them their acknowledgments for the spirit and firmness with which they had resisted the usurpations of despotism. The submission of the king to the designs of Russia was no sooner made known, than Poland was bereft of all her best and most respectable citizens. Malachowski as marshal of the diet, and Prince Sapieha grand marshal of Lithuania, entered strong protests on the journals of the diet against these hostile proceedings, and declared solemnly that the diet legally assembled in 1788 was not dissolved.

On the second of August a confederation was formed at Warsaw, of which the grand apostate, Potocki, was chosen Marshall. The acts of this confederation were evidently the despotic dictates of Russia, and were calculated only to restore the ancient abuses, and to place the country under the aggravated oppression of a foreign yoke.

It is remarkable, that at the very moment when Poland was surrendering its liberties to its despotic invaders, the generous sympathy of Great Britain was evinced, by a liberal subscription, supported by all the most respectable characters in the nation, of every party and of every sect, for the purpose of assisting the king and the republic to maintain their independence. 154
The em-
press sei-
zes upon
part of the
Polish ter-
ritory.

Not satisfied with restoring the old wretched constitution, the empress of Russia seized upon part of the territory which, at the last partition, she and her coadjutors had left to the republic; and her ambassador entering into the diet with a crowd of armed Russians, compelled the king and that assembly to grant the form of legality to her usurpations. The nation, however, did not submit. General Kosciuszko kept together a few retainers, whom he was soon enabled to augment to the number of an army; and seizing on the person of the king, he has ever since waged against Russia a war, of which, it must be confessed, the object is doubtful. His enemies accuse him of cherishing in the republic the principles of the French Jacobins; and some late occurrences give a countenance to the accusation. Yet it is known he protested at first that his aim reached no farther than to restore the constitution of 1791; and if public report may be credited, an insurrection has lately taken place in Great Poland, or south Prussia, in favour of that constitution. If other Poles have been driven to democracy, they have only, with the common weakness of human nature, run from one extreme to another; and in flying from the tyranny of their invaders, have fallen into the horrors of anarchy. That Kosciuszko will succeed against the powerful empire of Russia, there is not the smallest probability: and if there were, the court of Berlin, to complete its character, has withdrawn from the most honourable alliance in which it was ever engaged, and seems to have employed the subsidy which it received from Great Britain for the maintenance of that alliance, to co-operate with the empress in annihilating the kingdom and republic of Poland. What will be the ultimate fate of that unhappy country, and its amiable sovereign, it is impossible to say; but appearances at present indicate a division of the whole territory among the three hostile powers who formerly robbed it of some of its most valuable provinces; and when that division is made, the virtuous Stanislaus may be removed to a better world by the dagger, by the bowl, by the gripe of a giant, or by a red-hot spit!

156
Air, cli-
mate, &c.
of Poland.

The air of this kingdom is cold in the north, but temperate in the other parts both in summer and winter, and the weather in both more settled than in many other countries. The face of the country is for the most part level, and the hills are but few. The Crapack or Carpathian mountains separate it from Hungary on the south. The soil is very fruitful both in corn and pasturage, hemp and flax. Such is the luxuriance of the pastures in Podolia, that it is said one can hardly see the cattle that are grazing in the meadows. Vast quantities of corn are yearly sent down the Vistula to Dantzic from all parts of Poland, and bought up chiefly by the Dutch. The eastern part of the country is full of woods, forests, lakes, marshes, and rivers; of the last of which, the most considerable in Poland are, the Vistula, Nieper, Niester, Duna, Bog, Warta, and Memel. The metals found in this country are iron and lead, with some tin, gold, and silver; but

there are no mines of the two last wrought at present. The other products of Poland are most sorts of precious stones, ochre of all kinds, fine rock-crystal; Muscovy glass, talc, alum, saltpetre, amber, pitcoal, quicksilver, spar, sal gem, lapis calaminaris, and vitriol. In Lesser Poland are salt-mines, which are the chief riches of the country, and bring most money into the exchequer. In the woods, which consist mostly of oak, beech, pine, and fir-trees, besides the more common wild beasts, are elks, wild asses, wild oxen or uri, lynxes, wild horses, wild sheep with one horn, bisons, hyenas, wild goats, and buffaloes. In the meadows and fenny ground is gathered a kind of manna; and the kermes-berries produced in Britain are used both in dying and medicine.

The inhabitants consist of nobles, citizens, and peasants. The first possess great privileges, which they enjoy partly by the indulgence of their kings, and partly by ancient custom and prescription. Some of them have the title of *prince*, *count*, or *baron*; but no superiority or pre-eminence on that account over the rest, which is only to be obtained by some public post or dignity. They have the power of life and death over their vassals; pay no taxes; are subject to none but the king; have a right to all mines and salt-works on their estates; to all offices and employments, civil, military, and ecclesiastic; cannot be cited or tried out of the kingdom; may choose whom they will for their king, and lay him under what restraints they please by the *Pacta Conventa*; and none but they and the burghers of some particular towns can purchase lands. In short, they are almost entirely independent, enjoying many other privileges and prerogatives besides those we have specified; but if they engage in trade, they forfeit their nobility.

157
Diff rent
classes of
inhabitants.

The Polish tongue is a dialect of the Slavonic: (see PHILOLOGY, n° 222.). It is neither copious nor harmonious. Many of the words, as they are written, have not a single vowel in them; but the High Dutch and Latin are understood and spoken pretty commonly, though incorrectly. The language in Lithuania differs much from that of the other provinces. True learning, and the study of the arts and sciences, have been little attended to in Poland, till of late they began to be regarded with a more favourable eye, and to be not only patronized, but cultivated by several of the nobles and others, both laymen and ecclesiastics.

158
Language;

There are two archbishops in the kingdom, viz. those of Gnesna and Laopol, and about a dozen bishops. The archbishop of Gnesna is always a cardinal, and primate of the kingdom. The prevailing religion is Popery, but there are great numbers of Lutherans, Calvinists, and Greeks, who are called *Dissidents*, and by the laws of the kingdom were intitled to toleration; but were much oppressed till very lately. The Jews are indulged with great privileges, and are very numerous in Poland; and in Lithuania, it is said there are a multitude of Mahometan Tartars. We may judge of the numbers of Jews in this country by the produce of their annual poll-tax, which amounts to near 57,000 rixdollars.

159

Archbi-
shops, &c.

There are few or no manufactures in the kingdom; if we except some linen and woollen clothes and hard- wares; and the whole trade is confined to the city of Dantzic, and other towns on the Vistula or Baltic.

160

Manufac-
tures.

Before the present troubles the king's revenue was all

161

Revenue,
all

Poland.
||
Pole.

all clear to himself; for he paid no troops, not even his own guards; but all the forces, as well as the officers of state, were paid by the republic. The public revenues arose chiefly from the crown-lands, the salt-mines in the palatinate of Cracow, from the rents of Marienburg, Dirschau, and Regenhuss, from the government of Cracow, and district of Niepolomiez, and from ancient tolls and customs, particularly those of Elbing and Dantzic. From what sources those revenues now arise, it is difficult to say; but Prussia has got possession of the most lucrative customs.

162
Order of
knight-
hood.

The order of the White Eagle was instituted by Augustus II. in the year 1705. Its ensign is a cross of gold enamelled with red, and appendant to a blue ribbon. The motto, *Pro fide, rege, et lege*.

163
Forces.

The standing forces of Poland are divided into the crown-army, and that of Lithuania, consisting of horse and foot, and amounting to between 20,000 and 30,000 men. Their troops are mostly cantoned on the crown-lands, and in Poland are paid by a capitation or poll-tax; but in Lithuania other taxes are levied for this purpose. Most of the foot are Germans. On any sudden and imminent danger, the whole body of the nobility, with their vassals, are obliged to appear in the field on horseback; and the cities and towns furnish a certain number of foot-soldiers, with carriages, and military stores: but for want of proper arms, provisions, subordination, and discipline, and by being at liberty after a few weeks to return home, this body has proved but of little advantage to the republic. Dantzic is the only place in the Polish dominions that deserves the name of a fortress, and it is now in the possession of Prussia. Foreign auxiliaries are not to be brought into the kingdom, nor the national troops to march out of it, without the consent of the states.

Such was the military establishment of Poland before the partition treaty. What it has been since, and is at present, we cannot positively say.

164
Character
of the
people.

The Poles are personable men, and have good complexions. They are esteemed a brave, honest people, without dissimulation, and exceedingly hospitable. They clothe themselves in furs in winter, and over all they throw a short cloak. No people keep grander equipages than the gentry. They look upon themselves as so many sovereign princes; and have their guards, bands of music, and keep open houses: but the lower sort of people are poor abject wretches, in the lowest state of slavery. The exercises of the gentry are hunting, riding, dancing, vaulting, &c. They reside mostly upon their estates in the country; and maintain themselves and families by agriculture, breeding of bees, and grazing.

POLAR, in general, something relating to the poles of the world, or poles of the artificial globes.

POLAR Regions, those parts of the world which lie near the north and south poles. See the article POLE.

POLARITY, the quality of a thing considered as having poles, or a tendency to turn itself into one certain posture; but chiefly used in speaking of the magnet.

POLE (Reginald), cardinal, and archbishop of Canterbury, a younger son of Sir Rich. Pole, Lord Montague, was born at Stoverton castle, in Staffordshire, in the year 1500. At seven years of age he was sent to a Carthusian monastery at Shene, near Richmond in Surry; and thence, when he was about 12 years old, removed

to Magdalen college in Oxford, where, by the instructions of the celebrated Lineacre and Latimer, he made considerable progress in learning. In 1515 he took the degree of bachelor of arts, and was admitted to deacon's orders some time after: in 1517, he was made prebendary of Salisbury, and in 1519 dean of Wimborne and dean of Exeter. We are not surprized at this young nobleman's early preferments, when we consider him as the kinsman of Henry VIII. and that he was bred to the church by the king's special command.

Being now about the age of 19, he was sent, according to the fashion of the times, to finish his studies at Padua in Italy, where he resided some time in great splendor, having a handsome pension from the king. He returned to England in 1525, where he was most graciously received at court, and universally admired for his talents and address; but preferring study and sequestration to the pleasures of a court, he retired to the Carthusian convent at Shene, where he had continued about two years, when the pious king began to divulge his scruples of conscience concerning his marriage with Catharine of Spain. Pole foresaw that this affair would necessarily involve him in difficulties; he therefore determined to quit the kingdom, and accordingly obtained leave to visit Paris. Having thus avoided the storm for the present, he returned once more to his convent at Shene; but his tranquillity was again interrupted by the king's resolution to shake off the pope's supremacy, of which Pole's approbation was thought indispensably necessary. How he managed in this affair, is not very clear. However, he obtained leave to revisit Italy, and his pension was continued for some time.

The king, having now divorced Queen Catharine, married Anne Boylen, and being resolved to throw off the papal yoke, ordered Dr Richard Sampson to write a book in justification of his proceedings, which he sent to Pole for his opinion. To this Pole, secure in the pope's protection, wrote a scurrilous answer, entitled *Pro Unitate Ecclesiastica*, and sent it to the king; who was so offended with the contents, that he withdrew his pension, stripped him of all his preferments, and procured an act of attainder to be passed against him. In the mean time, Pole was created a cardinal, and sent nuncio to different parts of Europe. King Henry made several attempts to have him secured and brought to England, but without effect. At length the pope fixed him as legate at Viterbo, where he continued till the year 1543, when he was appointed legate at the council of Trent, and was afterwards employed by the pope as his chief counsellor.

Pope Paul III. dying in 1549, Pole was twice elected his successor, and we are told, twice refused the papal dignity: first, because the election was made in too great haste; and the second time, because it was done in the night. This delicacy in a cardinal is truly wonderful: but the intrigues of the French party seem to have been the real cause of his miscarriage; they started many objections to Pole, and by that means gained time to procure a majority against him. Cardinal Maria de Monte obtained the triple crown; and Pole, having kissed his slipper, retired to the convent of Magazune near Verona, where he continued till the death of Edward VI. in the year 1553. On the accession of queen Mary, Pole was sent legate to England, where he was received by her majesty with great veneration, and conducted

Pole.

¹ **Pole.** dusted to the archbishop's palace at Lambeth, poor Cranmer being at that time prisoner in the tower. He immediately appeared in the House of Lords, where he made a long speech; which being reported to the commons by their speaker, both these obsequious houses concurred in an humble supplication to be reconciled to the see of Rome. They presented it on their knees to her majesty, who interceded with the cardinal, and he graciously condescended to give them absolution. This business being over, the legate made his public entry into London, and immediately set about the extirpation of heresy. The day after the execution of Cranmer, which he is said, though we believe falsely, to have advised, he was consecrated archbishop of Canterbury. In the same year, 1556, he was elected chancellor of the university of Oxford, and soon after of Cambridge; both which he visited, by his commissioners. He died of a double quartan ague in the year 1558, about 16 hours after the death of the queen; and was buried in the cathedral of Canterbury.

As to his character, the Romish writers ascribe to him every virtue under heaven: even Bishop Burnet is extremely lavish in his praise, and attributes the cruelties of Mary's reign to the advice of Gardiner. In this Mr Hume agrees with the bishop, and, represents Pole as the advocate of toleration. By every impartial account, he seems to have been a man of mild manners, and of real worth, though undoubtedly a zealous member of the church of Rome.—He wrote, *Pro unitate ecclesiastica, De ejusdem potestate*, A Treatise on Justification, and various other tracts.

Mr Philips published a very well written, though a very partial account, of Pole's life, to which Gloucester Ridley replied. This last work, which is intitled a *Review of Mr Philips's Life of Reginald Pole*, was published in 1766. It is a complete confutation of the former, and is a very learned and temperate vindication of the doctrines of the Reformation.

POLE, in astronomy, that point in the heavens round which the whole sphere seems to turn. It is also used for a point directly perpendicular to the centre of any circle's plane, and distant from it by the length of a radius.

POLE, in geography, one of the points on which the terraqueous globe turns; each of them being 90 degrees distant from the equator, and, in consequence of their situation, the inclination of the earth's axis, and its parallelism during the annual motion of our globe round the sun, having only one day and one night throughout the year.

¹ **The poles enjoy much light;** It is remarkable that though the *north* in Hebrew, Greek, Latin, and French, derives its name from gloom, obscurity, and darkness, the poles enjoy more light than any other part of the world. The ancients believed the north to be covered with thick darkness; Strabo, tells us, that Homer, by the word *σκοτος*, which properly signifies *obscurity* or *darkness*, meant the *north*; and thus Tibullus, speaking of the north, says,

Illic et densa tellus absconditur umbra.

Paneg. ad Missel.

The Arabians call the northern ocean the *dark sea*; the Latins gave the name of *Aquilo* to the north wind, because *aquilus* signifies *black*; and the French call it *la bise*, from *bis* "black." According to the ancients, the

Cimmerians lived in darkness, because they were placed near the north. But all this is mere prejudice; for there are no places in the world that enjoy light longer than the arctic and antarctic poles; and this is accounted for by considering the nature of twilight. In the torrid zone, and under the line, night immediately follows the setting of the sun, without any sensible twilight; whereas the twilight begins and continues increasing in proportion as places are distant from the equator or approach the pole. To this long twilight we must add the *aurora borealis*, which appears in the northern regions, Greenland, &c. in clear nights, at the beginning of the new moon, casting a light equal to that of full moon. See Gassendi in *the life of Peyresse*, book iii. and La Perere in his *Account of Greenland*. There is also long moonlight at the poles during winter. See *ASTRONOMY*, 373. But though there is really more light in the polar regions than elsewhere, yet owing to the obliquity with which the rays of the sun fall upon them, and the great length of winter night, the cold is so intense, that those parts of the globe which lie near the poles have never been fully explored, though the attempt has been repeatedly made by the most celebrated navigators. Indeed their attempts have chiefly been confined to the northern regions; for with regard to the south pole, there is not the same incitement to attempt it. The great object for which navigators have ventured themselves in these frozen seas, was to find out a more quick and more ready passage to the East Indies*; and this hath been attempted three several ways: one by coasting along the northern parts of Europe and Asia, called the *north-east passage*; another, by sailing round the northern part of the American continent, called the *north-west passage*; and the third, by sailing directly over the pole itself.

We have already given a short account of several unsuccessful attempts which have been made from England to discover the first two of these. See *NORTH-West Passage*, and *NORTH-East Passage*. But before we proceed to the third, we shall make a few further observations on them, and mention the attempts of some other nations.

³ **Attempts to find out the north-east passage.** During the last century, various navigators, particularly attempted to find out the *north-east passage*, with great fortitude and perseverance. They always found it impossible, however, to surmount the obstacles which nature had thrown in the way. Subsequent attempts are thought by many to have demonstrated the impossibility of ever sailing eastward along the northern coast of Asia; and this impossibility is accounted for by the increase of cold in proportion to the extent of land. See *AMERICA*, n° 3—5. This is indeed the case in temperate climates; but much more so in those frozen regions where the influence of the sun, even in summer, is but small. Hence, as the continent of Asia extends a vast way from west to east, and has besides the continent of Europe joined to it on the west, it follows, that about the middle part of that tract of land the cold should be greater than anywhere else. Experience has determined this to be fact; and it now appears, that about the middle part of the northern coast of Asia the ice never thaws; neither have even the hardy Russians and Siberians themselves been able to overcome the difficulties they met with in that part of their voyage. In order to make this the more plain

and

Pole.

² **And why.**

* See Cook, p. 395. col. 2.

³ **Attempts to find out the north-east passage.**

⁴ **Why it is impossible to sail along the north-east coast of Asia.**

Pole. and the following accounts more intelligible, we shall observe, that from the north-western extremity of Europe, called the *Norih Cape*, to the north-eastern extremity of Asia, called the *Promontory of the Tschukki**, is a space including about 160 degrees of longitude, viz. from 40 to 200 east from Ferro: the port of Archangel lies in about 57 degrees east longitude, Nova Zembla between 70 and 95; which last is also the situation of the mouth of the great river Oby. Still farther eastward are the mouths of the rivers Jenisey in 100°; Pisafida in 105°; Chatanga in 124°; Lena, which has many mouths, between 134° and 142°; Indigirka in 162°; and the Kovyma in 175°. The coldest place in all this tract, therefore, ought to be that between the mouths of the Jenisey and the Chatanga; and indeed here the unfurmountable difficulty has always been, as will appear from the following accounts of the voyages made by the Russians with a view to discover the north-east passage.

5
Voyage of
Morzo-
vieff, &c.
In 1734, lieutenant Morzovieff failed from Archangel towards the river Oby, but could scarce advance 20 degrees of longitude during that season. The next summer he passed through the straits of Weygatz into the sea of Kara; but did not double the promontory which separates the sea of Kara from the bay or mouth of Oby. In 1738, the lieutenants Malgyn and Shurakoff doubled that promontory with great difficulty, and entered the bay of Oby. Several unsuccessful attempts were made to pass from the bay of Oby to the Jenisey; which was at last effected, in 1738, by two vessels commanded by lieutenants Offzin and Koskeleff. The same year the pilot Feodor Menin failed eastward from the Jenisey to the mouth of the Pisafida: but here he was stopped by the ice; and finding it impossible to force a passage, he returned to the Jenisey.

6
Of Pront-
shistcheff,
In July 1735, lieutenant Prontshistcheff failed down the river Lena, in order to pass by sea to the mouth of the Jenisey. The western mouths of the Lena were so choaked up with ice, that he was obliged to pass thro' the most easterly one; and was prevented by contrary winds from getting out till the 13th of August. Having steered north-west along the islands which lie scattered before the mouths of the Lena, he found himself lat. 70.4.; yet even here he saw pieces of ice from 24 to 60 feet in height, and in no place was there a free channel left of greater breadth than 100 or 200 yards. His vessel being much damaged, he entered the mouth of the Olenek, a small river near the western mouth of the Lena; and here he continued till the ensuing season, when he got out in the beginning of August. But before he could reach the mouth of the Chatanga, he was so entirely surrounded and hemmed in with ice, that it was with the utmost difficulty he could get loose. Observing then a large field of ice stretched into the sea, he was obliged to sail up the Chatanga. Getting free once more, he proceeded northward, doubled the cape called *Taimura*, and reached the bay of that name, lying in about 115° east from Ferro; from thence he attempted to proceed westward along the coast. Near the shore were several small islands, between which and the shore the ice was immoveably fixed. He then directed his course towards the sea, in order to pass round the chain of islands. At first he found the sea more free to the north of these islands, but observed much ice lying between them. At last he

arrived at what he took to be the last of the islands, lying in lat. 77. 25. Between this island and the shore, as well as on the other side of the island which lay most to the north, the ice was firm and immovable. He attempted, however, to steer still more to the north; and having advanced about six miles, he was prevented by a thick fog from proceeding: this fog being dispersed, he saw nothing everywhere but ice, which at last drove him eastward, and with much danger and difficulty he got to the mouth of the Olenek on the 29th of August.

Another attempt to pass by sea from the Lena to the Of Char-
Jenisey was made in 1739 by Chariton Laptieff, but ton Lap-
with no better success than that just mentioned. This tieff.
voyager relates, that between the rivers Pisafida and Taimura, a promontory stretches into the sea, which he could not double, the sea being entirely frozen up before he could pass round.

8
Besides the Russians, it is certain that some English Mr Cox's
and Dutch vessels have passed the island of Nova Zem- observa-
bla into the sea of Kara: "But (says Mr Cox in his tions,
Account of the Russian voyages) no vessel of any nation has ever passed round that cape which extends to the north of the Pisafida, and is laid down in the Russian charts in about 75° lat. We have already seen that no Russian vessel has ever got from the Pisafida to the Chatanga, or from the Chatanga to the Pisafida; and yet some authors have positively asserted that this promontory has been sailed round. In order therefore to elude the Russian accounts, which clearly assert the contrary, it is pretended that Gmelin and Muller have purposely concealed some parts of the Russian journals, and have imposed on the world by a misrepresentation of facts. But without entering into any dispute upon this head, I can venture to affirm, that no sufficient proof has been as yet advanced in support of this assertion; and therefore, until some positive information shall be produced, we cannot deny plain facts, or give the preference to hearsay evidence over circumstantial and well attested accounts."

9
The other part of this north-east passage, viz. from Of the na-
the Lena, to Kamfchatka, though sufficiently difficult vigation.
and dangerous, is yet practicable; as having been once from the
performed, if we may believe the accounts of the Rus- Lena to
sians. According to some authors indeed, says Mr Cox, Kamfchat-
this navigation has been open a century and an half; ka.
and several vessels at different times have passed round the north-eastern extremity of Asia. But if we consult the Russian accounts, we shall find that frequent expeditions have been unquestionably made from the Lena to the Kovyma, but that the voyage from the Kovyma round Tschutskoi Nofs into the Eastern Ocean has been performed but once. According to Mr Muller, this formidable cape was doubled in the year 1648. The material incidents of this remarkable voyage are as follow.

10
"In 1648 seven katches, or vessels failed from the Voyage of
mouth of the river Kovyma, in order to penetrate into Deshneff,
the Eastern Ocean. Of these, four were never more Ankudi-
heard of: the remaining three were commanded by Si- noff, &c.
mon Deshneff, Gerasim Ankudinoff, and Fedot Alex-
eeff. Deshneff and Ankudinoff quarrelled before their departure concerning the division of profits and honours to be acquired by their voyage; which, however, was not so easily accomplished as they had imagined. Yet

Pole.

Dezhneff in his memorials makes no mention of obstructions from the ice, nor probably did he meet with any; for he takes notice that the sea is not every year so free from ice as it was at that time. The vessels sailed from the Kovyma on the 20th of June, and in September they reached the promontory of the Tschutski, where Ankudinoff's vessel was wrecked, and the crew distributed among the other two. Soon after this the two vessels lost sight of each other, and never joined again. Dezhneff was driven about by tempestuous winds till October, when he was shipwrecked considerably to the south of the Anadyr. Having at last reached that river, he formed a scheme of returning by the same way that he had come; but never made the attempt. As for Alexeeff, after being also shipwrecked, he had died of the scurvy, together with Ankudinoff; part of the crew were killed by the savages, and a few escaped to Kamtschatka, where they settled."

* See
Cook's
Discoveries, n^o
95—100.

From Captain * Cook's voyage towards the north-eastern parts of Asia, it appears, that it is possible to double the promontory of Tschutski without any great difficulty: and it now appears, that the continents of Asia and America are separated from one another but by a narrow strait, which is free from ice; but, to the northwards, that experienced navigator was everywhere stopped by ice in the month of August, so that he could neither trace the American continent farther than to the latitude of 70°, nor reach the mouth of the river Kovyma on the Asiatic continent; though it is probable that this might have been done at another time when the situation of the ice was altered either by winds or currents.

11
Insurmountable
obstacles
in the
north-east
passage.

On the whole, therefore, it appears that the insurmountable obstacle in the north-east passage lies between the rivers Pisida and Chatanga; and unless there be in that space a connection between the Asiatic and American continents, there is not in any other part. Ice, however, is as effectual an obstruction as land: and though the voyage were to be made by accident for once, it never could be esteemed a passage calculated for the purposes of trade, or any other beneficial purpose whatever.

12
Of the
north-west
passage.

With regard to the north-west passage, the same difficulties occur as in the other. Captain Cook's voyage has now assured us, that if there is any strait which divides the continent of America into two, it must lie in a higher latitude than 70°, and consequently be perpetually frozen up. If a north-west passage can be found then, it must be by sailing round the whole American continent, instead of seeking a passage through it, which some have supposed to exist in the bottom of Baffin's Bay. But the extent of the American continent to the northward is yet unknown; and there is a possibility of its being joined to that part of Asia between the Pisida and Chatanga, which has never yet been circumnavigated*. It remains therefore to consider, whether there is any possibility of attaining the wished for passage by sailing directly north, between the eastern and western continents.

* See
Cook's
Discoveries, n^o
11.

13
Barrington's
arguments in
favour of
a possibility
of reaching
the pole.

Of the practicability of this method, the Honourable Daines Barrington is very confident, as appears by several tracts which he published in the years 1775 and 1776, in consequence of the unsuccessful attempts made by Captain Phipps, now Lord Mulgrave. See *NORTH-EAST Passage*, p. 103. col. 1. top of the page — In these

Pole.

tracts he instances a great number of navigators who have reached very high northern latitudes; nay, some who have been at the pole itself, or gone beyond it. — These instances are, 1. One Captain Thomas Robertson assured our author, that he had been in latitude 82½°, that the sea was open, and he was certain that he could have reached the latitude of 83°. — 2. From the testimony of Captain Cheyne, who gave answers to certain queries drawn up by Mr Dalrymple concerning the polar seas, it appears that he had been in the latitude of 82°. — 3. One Mr Watt informed our author, that when he was 17 years of age, at that time making his first voyage with Captain M'Callam, a bold and skilful navigator, who commanded a Scotch whale-fishing ship, as during the time that the whales are supposed to copulate no fishing can be carried on, the captain resolved to employ that interval in attempting to reach the north pole. He accordingly proceeded without the least obstruction to 83½°, when the sea was not only open to the northward, but they had seen no ice for the last three degrees; but while he still advanced, the mate complained that the compass was not steady, and the captain was obliged with reluctance to give over his attempt. — 4. Dr Campbell, the continuator of Harris's voyages, informed Mr Barrington, that Dr Dallie, a native of Holland, being in his youth aboard a Dutch ship of war which at that time was usually sent to superintend the Greenland fishery, the captain determined, like the Scotchman abovementioned, to make an attempt to reach the pole during the interval between the first and second fisheries. He penetrated, according to the best of Dr Campbell's recollection, as far as 88°; when the weather was warm, the sea free from ice, and rolling like the bay of Biscay. Dallie now pressed the captain to proceed: but he answered, that he had already gone too far, and should be blamed in Holland for neglecting his station; upon which account he would suffer no journal to be kept, but returned as soon as possible to Spitzbergen. — 5. In the year 1662-3, Mr Oldenburg, then secretary of the Royal Society, was ordered to register a paper, entitled "Several inquiries concerning Greenland, answered by Mr Gray, who had visited these parts." The 19th of these queries is the following: How near hath any one been known to approach the pole? — The answer is, "I once met upon the coast of Greenland a Hollander that swore he had been half a degree from the pole, showing me his journal, which was also attested by his mate; where they had seen no ice or land, but all water." — 6. In Captain Wood's account of a voyage in quest of the north-east passage, we have the following account of a Dutch ship which reached the latitude of 89°. "Captain Goulden, who had made above 30 voyages to Greenland, did relate to his majesty, that being at Greenland some 20 years before, he was in company with two Hollanders to the eastward of Edge's island; and that the whales not appearing on the shore, the Hollanders were determined to go farther northward; and in a fortnight's time returned, and gave it out that they had sailed into the latitude 89°, and that they did not meet with any ice, but a free and open sea, and that there run a very hollow grown sea like that of the Bay of Biscay. Mr Goulden being not satisfied with the bare relation, they produced him four journals out of the two ships, which testified the same, and that they all agreed within four minutes."

Pole. minutes."—7. In the Philosophical Transactions for 1675 we have the following passage: "For it is well known to all that sail northward, that most of the northern coasts are frozen up for many leagues, though in the open sea it is not so, *no nor under the pole itself*, unless by accident." In which passage the having reached the pole is alluded to as a known fact, and as such stated to the Royal Society.—8. Mr Miller, in his Gardener's Dictionary, mentions the voyage of one Captain Johnson, who reached 88 degrees of latitude. Mr Barrington was at pains to find a full account of this voyage; but met only with the following passage in Buffon's Natural History, which he takes to be a confirmation of it. "I have been assured by persons of credit, that an English captain, whose name was Monson, instead of seeking a passage to China between the northern countries, had directed his course to the pole, and had approached it within two degrees, where there was an open sea, without any ice." Here he thinks that Mr Buffon has mistaken Johnson for Monson.—9. A map of the northern hemisphere, published at Berlin (under the direction of the Academy of Sciences and Belles Lettres), places a ship at the pole, as having arrived there according to the Dutch accounts.—10. Moxon, hydrographer to Charles II. gives an account of a Dutch ship having been two degrees beyond the pole, which was much relied on by Wood. This vessel found the weather as warm there as at Amsterdam.

Besides these, there are a great number of other testimonies of ships which have reached the lat. of 81, 82, 83, 84 (A), &c.; from all which our author concludes, that if the voyage is attempted at a proper time of the year, there would not be any great difficulty of reaching the pole. Those vast pieces of ice which commonly obstruct the navigators, he thinks, proceed from the mouths of the great Asiatic rivers which run northward into the frozen ocean, and are driven eastward and westward by the currents. But though we should suppose them to come directly from the pole, still our author thinks that this affords an undeniable proof that the pole itself is free from ice; because, when the pieces leave it, and come to the southward, it is impossible that they can at the same time accumulate at the pole.

The extreme cold of the winter air on the continents of Asia and America has afforded room for suspicion, that the pole itself, and for several degrees to the southward of it, the sea must be frozen to a vast depth in one solid cake of ice; but this Mr Barrington refutes from several considerations. In the first place, he says, that on such a supposition, by the continual intensity of the cold, and the accumulation of snow and frozen vapour, this cake of ice must have been increasing in thickness since the creation, or at least since the deluge; so that now it must be equal in height to the highest mountains in the world, and be visible at a great distance. Besides, the pieces broken off from the sides of such an immense mountain must be much thicker than any ice that is met with in the northern ocean; none of which is above two yards in height above the surface of the water, those immense pieces called *ice-mountains* being always formed on land.

Again, the system of nature is so formed, that all parts of the earth are exposed for the same length of time, or nearly so, throughout the year to the rays of the sun. But, by reason of the spheroidal figure of the terraqueous globe, the poles and polar regions enjoy the sun somewhat longer than others; and hence the Dutch who wintered in Nova Zembla in 1672 saw the sun a fortnight sooner than they ought to have done by astronomical calculations. By reason of this flatness about the poles, too, the sun not only shines for a greater space of time on these inhospitable regions, but with less obliquity in the summer-time, and hence the effect of his rays must be the greater. Now Mr Barrington considers it is an absurd supposition, that this glorious luminary should shine for six months on a cake of barren ice where there is neither animal nor vegetable. He says that the polar seas are assigned by nature as the habitation of the whales, the largest animals in the creation; but if the greatest part of the polar seas are for ever covered with an impenetrable cake of ice, these huge animals will be confined within very narrow bounds; for they cannot subsist without frequently coming to the top of the water to breathe.

Lastly, the quantity of water frozen by different degrees of cold is by no means directly in proportion to

Q q 2

Pole.
14
Why we cannot suppose the sea all round the pole to be frozen.

15
Quantity of ice the formed is not always in proportion to the degree of cold.

(A) See *M. Bauche's Observations on the North or Ice Sea*, where he gives an account of various attempts made to reach the pole, from which he is convinced that the sea is there open, and that the thing is practicable. M. de Pages, in his *Travels*, Vol. III. informs us, that he wished to take a voyage to the north seas, for the purpose of bringing under one view the various obstacles from the ice, which have impeded the researches of navigators in those seas; and for this purpose he was prepared to continue his voyage to as high a latitude as possible, and that he might be able to say whether any land actually exists north from the coast of Greenland. He sailed without any encouragement from his court (France) on the 16th of April 1776 from the Texel, in a Dutch vessel bound to Spitzbergen. On the 16th of May she was a little way north of 81°, the highest latitude she reached.

"Being now (says the author) less than 180 leagues from the pole, the idea of so small a distance served effectually to awaken my curiosity. Had I been able to inspire my fellow-voyagers with sentiments similar to my own, the winds and currents which at this moment carried us fast towards the pole, a region hitherto deemed inaccessible to the eye of mortals, would have been saluted with acclamations of joy. This quarter, however, is not the most eligible for such an enterprize: here the sea lying in the vicinity of those banks of ice, so frequent a little farther to the west, is much too confined. Nevertheless, when I consider the very changeable nature of the shoals under whatever form, even in their most crowded and compact state; their constant changes and concussions which break and detach them from one another, and the various expedients that may be employed for freeing the ship from confinement, as well as for obviating impending danger—I am far from viewing a voyage to the pole as a chimerical idea."

Pole.

Pole.

the intensity of the cold, but likewise to the duration of it. Thus, large bodies of water are never frozen in any temperature of short duration, though shallow bodies often are. Our author observes, that as much of a given mass of water was frozen in five hours of a temperature 12° below the freezing point, as was frozen in one hour of the temperature 50° below it; and that long duration of the temperature between 20 and 32° is, with regard to the congelation of water, equivalent to intensity of cold such as is marked 0 and below 0 in Fahrenheit, but of short duration. See COLD and CONGELATION.

16
Mr Forster's arguments against the possibility of reaching the pole.

On the other hand, Mr Forster, in his Observations, takes the contrary side of the question with no little vehemence. "I know (says he) that M. de Buffon, Lomonosof, and Crantz, were of opinion, that the ice found in the ocean is formed near the lands only from the fresh water and ice carried down into the sea by the many rivers in Siberia, Hudson's Bay, &c.; and therefore, when we fell in with such quantities of ice in December 1772, I expected we should soon meet with the land from whence these ice masses had been detached. But being disappointed in the discovery of this land, though we penetrated beyond the 67° twice, and once beyond 71° , south latitude, and having besides some other doubts concerning the existence of the pretended southern continent, I thought it necessary to inquire what reasons chiefly induced the above authors to form the opinion that the ice floating in the ocean must be formed near land, or that an austral land is absolutely requisite for that purpose; and having looked for their arguments, I find they amount chiefly to this: 'That the ice floating in the ocean is all fresh: that salt water does not freeze at all; or if it does, it contains briny particles. They infer from thence, that the ice in the ocean cannot be formed in the sea far from any land, there must therefore exist austral lands; because, in order to form an idea of the original of the great ice-masses agreeably to what is observed in the northern hemisphere, they find that the first point for fixing the high ice-lands is the land; and, secondly, that the great quantity of flat ice is brought down the rivers.' I have impartially and carefully considered and examined these arguments, and compared every circumstance with what we saw in the high southern latitude, and with other known facts; and will here insert the result of all my inquiries on this subject.

"First, they observe the ice floating in the ocean to yield, by melting, fresh water: which I believe to be true. However, hitherto it has by no means been generally allowed to be fresh: for Crantz says expressly, that 'the flat pieces (forming what they call the ice-fields) are salt, because they were congealed from sea-water.' The ice taken up by us for watering the ship was of all kinds, and nevertheless we found it constantly fresh: Which proves, either that the principle of analogy cannot be applied indiscriminately in both hemispheres; and that one thing may be true in the northern

hemisphere which is quite otherwise in the southern, from reasons not yet known or discovered by us; or we must think that Crantz and others are mistaken, who suppose the ice floating in the ocean to be salt.

"The next remark is, That salt water does not freeze at all; or if it does, it contains briny particles. M. de Buffon tells us, 'that the sea between Nova Zembla and Spitzbergen, under the 79° north latitude, does not freeze, as it is there considerably broad: and that it is not to be apprehended to find the sea frozen not even under the pole itself; for indeed there is no example of having ever found a sea wholly frozen over, and at a considerable distance from the shores; that the only instance of a sea entirely frozen is that of the Black Sea, which is narrow and not very salt, and receives a great many rivers coming from northern regions, and bringing down ice that this sea therefore sometimes freezes to such a degree, that its whole surface is congealed to a considerable thickness; and, if the historians are to be credited, was frozen, in the reign of the emperor Constantine Copronymus, 30 ells thick, not including 20 ells of snow which was lying on the ice. This fact, continues M. de Buffon, seems to be exaggerated: but it is true, however, that it freezes almost every winter; whilst the high seas which are 1000 leagues nearer towards the pole do not freeze; which can have no other cause than the difference in saltness, and the little quantity of ice carried out by rivers, if compared to the enormous quantity of ice which the rivers convey into the Black Sea.' M. de Buffon is not mistaken when he mentions that the Black Sea frequently freezes. Strabo informs us, that the people near the Bosphorus Cimmerius pass this sea in carts from Panticapæum to Phanagorea; and that Neoptolemus, a general of Mithridates Eupator, won a battle with his cavalry on the ice on the very spot where he gained a naval victory in the summer. Marcellinus Comes relates, that under the consulship of Vincentius and Fravita, in the year 401 after Christ, the whole surface of the Pontus was covered with ice, and that the ice in spring was carried through the Propontis, during 30 days, like mountains. Zonaras mentions the sea between Constantinople and Scutari frozen to such a degree in the reign of Constantine Copronymus, that even loaded carts passed over it. The prince Demetrius Cantemir observes, that in the year 1620-1 there happened so intense a frost, that the people walked over the ice from Constantinople to Iskodar. All these instances confirm M. de Buffon's assertion. But as this great natural historian says that the Black Sea is the only instance of a sea being entirely frozen (B), I must beg leave to dissent from him; for it is equally well attested that the Baltic is sometimes entirely frozen, according to Caspar Schutz's account. In the year 1426, the winter was so severe, that people travelled over the ice across the Baltic from Dantzic to Lubeck; and the sea was likewise passable from Denmark to Mecklenburgh: and in the year 1459 the whole Baltic was entirely frozen, so that persons travelled, both on foot and on horseback, over

(B) In the year 860 the Mediterranean was covered with ice, so that people travelled in carts and horses across the Ionian Sea to Venice; (*Hermannus Contractus ap. Pistor. Script. t. ii. p. 236.*) And in 1234 the Mediterranean was again thus frozen, that the Venetian merchants travelled over the ice with their merchandise to what place they chose; *Matth. Paris, p. 78.*

Pole.

over ice from Denmark to the Vendick Hans-towns, called *Lubeck*, *Wismar*, *Rostock*, and *Stralsund*, which had never happened before; people likewise travelled across the Baltic over ice from Reval in Estland to Denmark and to Sweden, and back again, without the least danger (c). But according to Sæmund Frode, even the great German Ocean between Denmark and Norway was frozen in the year 1048, so that the wolves frequently ran over the ice from one country to the other. The great northern ocean is likewise most certainly sometimes frozen to a great distance from any land: for Muller relates, that in the year 1715 a Cossack called *Markoff*, with some other persons, was sent by the Russian government to explore the north sea; but finding it next to impossible to make any progress during summer on account of the vast quantities of ice commonly filling this ocean, he at last determined to try the experiment during winter. He therefore took several sledges drawn according to the custom of the country by dogs, which commonly go about 80 or 100 versts per day, 105 of which make a degree; and on March the 15th, old style, with this caravan of nine persons, he left the shores of Siberia at the mouth of the river Yana, under the 71° of north latitude, and proceeded for seven days together northward, so that he had reached at least the 77° or 78° north latitude, when he was stopped by the ice, which there began to appear in the shape of prodigious mountains. He climbed up to the top of some of these ice-mountains: but seeing from thence no land, nor any thing except ice as far as the eye could reach, and having besides no more food for his dogs left, he thought it very necessary to return; which he with great difficulty performed, on April the 3d, as several of the dogs, which had perished for want, were employed to support those that remained alive. These facts, I believe, will convince the unprejudiced reader, that there are other seas besides the Black Sea which really do freeze in winter, and that the ice carried down the rivers could not at least freeze the German Ocean between Norway and Denmark, because the rivers there are so small, and bear a very inconsiderable proportion to the immense ocean, which, according to experiments made by Mr Wilke, is very salt, though near the land, in the Swedish harbour of Landscrona.

Pole.

“ Now, if six or seven degrees of latitude, containing from 360 to 420 sea-miles, are not to be reckoned a great distance from the land, I do not know in what manner to argue, because no distance whatsoever will be reckoned far from any land. Nay, if the Cossack Markoff, being mounted on one of the highest ice-mountains, may be allowed to see at least to the distance of 20 leagues, the extent alluded to above must then be increased to 480 English sea-miles; which certainly is very considerable, and makes it more than probable that the ocean is frozen in winter, in high northern latitudes, even as far as the pole. Besides, it invalidates the argument which these gentlemen wish to infer from thence *that the ocean does not freeze in high latitudes, especially where there is a considerable broad sea*; for we have shown instances to the contrary.

“ But M. de Buffon speaks of ice carried down the rivers into the northern ocean, and forming there these immense quantities of ice. ‘ And in case, says he, we would suppose, against all probability, that at the pole it could be so cold as to congeal the surface of the sea, it would remain equally incomprehensible how these enormous floating ice-masses could be formed if they had not land for a point to fix on, and from whence they are severed by the heat of the sun. The two ships which the India Company sent in 1739 upon the discovery of the austral lands, found ice in 47° or 48° south latitude, but at no great distance from land; which they discovered, without being able to approach it. This ice, therefore, must have come from the interior parts of the lands near the south pole; and we must conjecture, that it follows the course of several large rivers, washing these unknown lands, in the same manner as the rivers Oby, the Yenisea, and the other great rivers which fall into the northern sea, carry the ice-masses, which stop up the straits of Waigats for the greater part of the year, and render the Tartarian sea inaccessible upon this course.’ Before we can allow the analogy between the rivers Oby, Yenisea, and the rest which fall into the northern ocean, and those coming from the interior parts of the austral lands, let us compare the situation of both countries, supposing the austral lands really to exist. The Oby, Yenisea, and the rest of the Siberian rivers, falling down into the northern

(c) In 1296 the Baltic was frozen from Gothland to Sweden. (*Incerti auctoris Annales Denor. in Westphalii monument. Cimbr. t. i. p. 1392.*)

In 1306 the Baltic was, during fourteen weeks, covered with ice between all the Danish and Swedish islands. (*Ludwig. reliquia, MSS. t. ix. p. 170.*)

In 1323 there was a road for foot-passengers and horsemen over the ice on the Baltic during six weeks. (*id. ibid.*)

In 1349, people walking over the ice from Stralsund to Denmark. (*Incerti auct. cit. ap. Ludwig. t. ix. p. 181.*)

In 1408 the whole sea between Gothland and Oeland, and likewise between Rostock and Gezoer, was frozen. (*id. ibid.*)

In 1423 the ice bore riding from Prussia to Lubec. (*Crantzii Vandal. l. x. c. 40.*) The whole sea was covered with ice from Mecklenburg to Denmark. (*Incert. auct. ap. Ludwig. t. ix. p. 125.*)

In 1461 (says Nichol. Marschallus in *Annal. Herul. ap. Westphal. t. i. p. 261.*) Tanta erat hyems, ut concreto gelu oceano plaustris millia passuum supra CCC merces ad ultimam Thylen (*Iceland*) et Orcades veherentur e Germania tota pene bruma.

In 1545 the sea between Rostock and Denmark, and likewise between Fionia and Sealand, was thus frozen, that the people travelled over the ice on foot, with sledges to which horses and oxen were put. (*Anonym. ap. Ludwig. t. ix. p. 176.*)

In 1294 the Cattegat or sea between Norway and Denmark was frozen; that from Oxflo in Norway, they could travel on it to Jutland, (*Strelow Chron. Juthiland, p. 148.*)

Pole.

northern ocean, have their sources in 48° and 50° north latitude, where the climate is mild and capable of producing corn of all kinds. All the rivers of this great continent increasing, these great rivers have likewise their sources in mild and temperate climates, and the main direction of their course is from south to north; and the coast of the northern ocean, not reckoning its sinuities, runs in general west and east. The small rivers which are formed in high latitudes have, properly speaking, no sources, no springs, but carry off only the waters generated by the melting of snow in spring, and by the fall of rain in the short summer, and are for the greatest part dry in autumn. And the reason of this phenomenon is obvious, after considering the constitution of the earth in those high northern climates. At Yakutsk, in about 62° north latitude, the soil is eternally frozen, even in the height of summer, at the depth of three feet from the furnace. In the years 1685 and 1686, an attempt was made to dig a well; and a man, by great and indefatigable labour, continued during two summer-seasons, and succeeded so far in this laborious task, that he at last reached the depth of 91 feet; but the whole earth at this depth was frozen, and he met with no water; which forced him to desist from so fruitless an attempt. And it is easy to infer from hence how impossible it is that springs should be formed in the womb of an eternally frozen soil.

17
Of the
freezing
of salt-
water.

"The argument, therefore, is now reduced to this, *That salt water does not freeze at all; or, if it does, the ice contains briny particles.* But we have already produced numberless instances, that the sea does freeze; nay, Crantz allows, *that the flat pieces of ice are salt, because they were congealed from sea-water.* We beg leave to add a few decisive facts relative to the freezing of the sea. Barentz observes in the year 1596, September the 16th, the sea froze two fingers thick, and next night the ice was as thick again. This happened in the midst of September; what effect then must the intense frost of a night in January not produce? When Captain James wintered in Carleton's Isle, the sea froze in the middle of December 1631. It remains, therefore, only to examine, whether the ice formed in the sea must necessarily contain briny particles. And here I find myself in a very disagreeable dilemma; for during the intense frost of the winter in 1776, two sets of experiments were made on the freezing of sea-water, and published, contradicting one another almost in every material point. The one by Mr Edward Nairne F. R. S. an ingenious and accurate observer; the other by Dr Higgins, who reads lectures on chemistry and natural philosophy, and consequently must be supposed to be well acquainted with the subject. I will therefore still venture to consider the question as undecided by these experiments, and content myself with making a few observations on them: but previously I beg leave to make this general remark, that those who are well acquainted with mechanics, chemistry, natural philosophy, and the various arts which require a nice observation of minute circumstances, need not be informed, that an experiment or machine succeeds often very well when made

upon a smaller scale, but will not answer if undertaken at large; and *vice versa*, machines and experiments executed upon a small scale will not produce the effect which they certainly have when made in a more enlarged manner. A few years ago an experiment made on the dyeing of scarlet, did not succeed when undertaken on a small scale, whereas it produced the desired effect when tried at a dyer's house with the large apparatus; and it evidently confirms the above assertion, which I think I have a right to apply to the freezing of salt-water. It is therefore probable, that the ice formed in the ocean at large, in a higher latitude, and in a more intense degree of cold, whereof we have no idea here, may become solid, and free from any briny particles, though a few experiments made by Dr Higgins, in his house, on the freezing of salt-water, produced only a loose spongy ice filled with briny particles.

"The ice formed of sea-water by Mr Nairne was very hard, $3\frac{1}{2}$ inches long, and 2 inches in diameter: it follows from thence, that the washing the outside of this ice in fresh water, could not affect the inside of a hard piece of ice. This ice when melted yielded fresh water, which was specifically lighter than water which was a mixture of rain and snow-water, and next in lightness to distilled water. Had the ice thus obtained not been fresh, the residuum of the sea-water, after this ice had been taken out, could not have been specifically heavier than sea-water, which, however, was the case in Mr Nairne's experiment. It seems, therefore, in my opinion, evident from hence, that salt-water does freeze, and has no other briny particles than what adhere to its outside. All this perfectly agrees with the curious fact related by Mr Adanson (D), who had brought to France two bottles of sea-water, taken up in different parts of the ocean, in order to examine it, and to compare its saltness, when more at leisure; but both the bottles containing the salt-water were burst by being frozen, and the water produced from melting the ice proved perfectly fresh. This fact is so fairly stated, and so very natural, that I cannot conceive it is necessary to suppose, without the least foundation for it, *that the bottles were changed, or that Mr Adanson does not mention the circumstance by which the sea-water was thus altered upon its being dissolved*: for as he expressly observes the bottles to have been burst, it is obvious that the concentrated briny parts ran out, and were entirely drained from the ice, which was formed of the fresh water only.

"The ice formed by Dr Higgins from sea-water, consisted of thin laminae, adhering to each other weakly. Dr Higgins took out the frozen ice from the vessels wherein he exposed the sea-water, and continued to do so till the remaining concentrated sea-water began to form crystals of sea-salt. Both these experiments, therefore, by no means prove what the Doctor intended to infer from thence; for it was wrong to take out such ice, which only consisted of thin laminae, adhering to each other weakly. Had he waited with patience, he would have obtained a hard ice as well as Mr Nairne, which by a more perfect congelation, would have excluded the

Pole.

18

Result of
Mr Nairne's
experiments on
this subject.

Pole. the briny particles intercepted between the *thin laminae*, adhering to each other weakly; and would have connected the laminae, by others formed by fresh water. The Doctor found afterwards, it is true, thicker and somewhat more solid ice: but the sea-water had already been so much concentrated by repeated congelations, that it is no wonder the ice formed in it became at last brackish: it should seem, then, that no conclusive arguments can be drawn from these experiments.

"There are two other objections against the formation of the ice in the great ocean. The *first* is taken from the immense bulk and size of the ice masses formed in the ocean, which is the *deepest mass of water we know of*. But it has been experimentally proved, that in the midst of summer, in the latitudes of 55° , $55^{\circ} 26'$, and 64° south, at 100 fathoms depth, the thermometer stood at 34° , $34^{\circ} \frac{1}{4}$ and 32° ; and that in all instances, the difference between the temperature at top and 100 fathoms depth never exceeded four degrees of Fahrenheit's thermometer, or that the temperature of the air did not differ five degrees from that of the ocean at 100 fathom deep. If we now add to this, that beyond the 71° south the temperature of the air and ocean must be still colder, and that the rigours of an antarctic winter are certainly more than sufficient to cool the ocean to $28^{\circ} \frac{1}{4}$, which is requisite for congealing the aqueous particles in it; if we moreover consider, that these severe frosts are continued during six or eight months of the year, we may easily conceive that there is time enough to congeal large and extensive masses of ice. But it is likewise certain, that there is more than one way by which those immense ice masses are formed. We suppose very justly, that the ocean does freeze, having produced so many instances of it; we allow likewise, that the ice thus formed in a calm, perhaps does not exceed three or four yards in thickness; a storm probably often breaks such an ice-field, which Crantz allows to be 200 leagues one way and 80 the other; the pressure of the broken fragments against one another frequently sets one upon the other piece, and they freeze in that manner together; several such double pieces, thrown by another pressure upon one another, form at last large masses of miles extent, and of 20, 40, 60, and more fathoms thickness, or of a great bulk or height. Martens, in his description of Spitzbergen, remarks, that the pieces of ice cause so great a noise by their shock, that the navigators in those regions can only with difficulty hear the words of those that speak; and as the ice-pieces are thrown one upon another, ice-mountains are formed by it. And I observed very frequently, in the years 1772 and 1773, when we were among the ice, masses which had the most evident marks of such a formation, being composed of strata of some feet in thickness. This is in some measure confirmed by the state in which the Cossack Markoff found the ice at the distance of 420 miles north from the Siberian coasts. The high masses were not found formed, as is suspected in the *Second supplement to the probability of reaching the north pole*, p. 143-145, near the land, under the high cliffs, but far out at sea; and when these ice mountains were climbed by Markoff, nothing but ice, and no vestiges of land, appeared as far as the eye could reach. The high climates near the poles are likewise subject to heavy falls of snow,

of several yards in thickness, which grow more and more compact, and by thaws and rain are formed into solid ice, which increase the stupendous size of the floating ice mountains.

"The *second* objection against the freezing of the ocean into such ice as is found floating in it, is taken from the *opacity* of ice formed in salt water; because the largest masses are commonly transparent like crystal, with a fine blue tint, caused by the reflection of the sea. This argument is very specious, and might be deemed unanswerable by those who are not used to cold winters and their effects. But whosoever has spent several winters in countries which are subject to intense frosts, will find nothing extraordinary or difficult in this argument: for it is a well-known fact in cold countries, that the ice which covers their lakes and rivers is often opaque, especially when the frost sets in, accompanied by a fall of snow; for, in those instances, the ice looks, before it hardens, like a dough or paste, and when congealed it is opaque and white; however, in spring, a rain and the thaw, followed by frosty nights, change the opacity and colour of the ice, and make it quite transparent and colourless like a crystal: but, in case the thaw continues, and it ceases entirely to freeze, the same transparent ice becomes soft and porous, and turns again entirely opaque. This I believe may be applicable to the ice seen by us in the ocean. The field-ice was commonly opaque; some of the large masses, probably drenched by rain, and frozen again, were transparent and pellucid; but the small fragments of loose ice, formed by the decay of the large masses, and soaked by long-continued rains, we found to be porous, soft, and opaque.

"It is likewise urged as an argument against the formation of ice in the ocean, that it always requires land, in order to have a point upon which it may be fixed. First, I observe, that in Mr Nairne's experiments, the ice was generated on the surface, and was seen shooting crystals downwards: which evidently evinces, in my opinion, that ice is there formed or generated where the intensest cold is; as the air sooner cools the surface than the depth of the ocean, the ice shoots naturally downwards, and cools the ocean more and more, by which it is prepared for further congelation. I suppose, however, that this happens always during calms, which are not uncommon in high latitudes, as we experienced in the late expedition. Nor does land seem absolutely necessary in order to fix the ice; for this may be done with as much ease and propriety to the large ice mountains which remain undissolved floating in the ocean in high latitudes; or it may, perhaps, not be improper to suppose, that the whole polar region, from 80° and upwards, in the southern hemisphere, remains a solid ice for several years together, to which yearly a new circle of ice is added, and of which, however, part is broken off by the winds and the return of the mild season. Wherever the ice floats in large masses, and sometimes in compact bodies formed of an infinite number of small pieces, there it is by no means difficult to freeze the whole into one piece; for amongst the ice the wind has not a power of raising high and great waves. This circumstance was not entirely unknown to the ancients; and it is probable they acquired this information from the natives

Pole.

of ancient Gaul, and from the Britons and other northern nations, who sometimes undertook long voyages. The northern ocean was called by the ancients the *frozen*, the *dead*, the *lazy*, and *immoveable sea*: sometimes they gave it the name *mare cronium*, the concrete sea, and *morimarusa*, the dead sea. And, what is very remarkable, in all the northern cold countries the frost sometimes is so intense, that all the waters become suddenly coagulated into a kind of paste or dough, and thus at once congeal."

19
Observations on
Mr Forster's rea-
soning.

On this reasoning of Mr Forster's, however, we must observe, that it cannot possibly invalidate any fact which Mr Barrington has advanced. The best concerted and most plausible theory in the world must yield to experience; for this is in fact what must judge all theories. Now, from what we have already related, it is demonstrated, that in the space between the mouths of the rivers Piafida and Chatanga more ice must be formed, and more intense colds generated, than in any other part of the world; consequently, for a considerable space, both on the east and west side of that, the sea must be more full of ice than any where else. Now, between these two rivers there is the promontory of Taimura, which runs out to the latitude of 78°, or near it, and which of necessity must obstruct the dispersion of the ice; and that it actually does so is in some degree probable; because in one of the Russian voyages abovementioned the eastern mouth of the Lena was quite free, when the western ones were entirely choaked up with ice. Now the mouth of the Yana lies several degrees to the eastward of the Lena: consequently, when the ice comes eastward from the cape of Taimura, it must necessarily fill all that sea to the latitude of 78° and upwards; but the Cossack Markoff, if he proceeded directly north, could not be farther than the promontory of Taimura, and consequently still enveloped among the ice. Besides, we are certain, that the sea in 78° is not at all frozen into a solid cake in some places, since Lord Mulgrave, in 1773, reached 81°. Mr Forster's argument, therefore, either proves nothing, or it proves too much. If it proves, that about the middle of the eastern continent the cold is so intense that a sufficient quantity of ice is formed to obstruct the navigation for several hundred miles round, this proves nothing; because we knew before that this must be the case: But if it proves, that the sea must be unnavigable by reason of ice all round the globe at 78° N. L. this is too much; because we certainly know, that in 1773 Lord Mulgrave reached the latitude of 81°. However, though it should be allowed that the sea is quite clear all the way to the pole, it must be a very great uncertainty whether any ship could by that way reach the East Indies; because we know that it must sail down between the continents of Asia and America, through that strait whose mouth must often be blocked up with ice driving eastward along the continent of Asia.

The south pole is still more inaccessible than the north pole; for the ice is found in much lower southern than northern latitudes. Upon this subject M. Pages speaks thus: "Having in former voyages (says he) visited many parts of the terraqueous globe in different latitudes, I had opportunities of acquiring a considerable knowledge of climate in the torrid as well as in the temperate divisions of the earth. In a subsequent voyage

I made it my business to be equally well informed respecting the reputed inhospitable genius of the South Seas; and upon my return from that expedition I entertained not the smallest doubt that there exists a peculiar and perpetual rigour in the southern hemisphere." (See his *Travels round the World*, v. iii. translated from the French, and printed at London, 1792, for Murray.) This superior degree of cold has by many been supposed to proceed from a greater quantity of land about the south than the north pole*; and the notion of a vast continent in these regions prevailed almost universally, inasmuch that many have fought for it, but hitherto in vain. See the articles *Cook's Discoveries*, n° 38—49. and n° 68. and 69. *SOUTH-SEA*, and *TERRA AUSTRALIS*.

Magnetic Pole. See MAGNET, MAGNETISM, § 4. p. 432. and p. 441. and VARIATION.

North Pole. See POLE.

POLE-AXE, a sort of hatchet nearly resembling a battle-axe, having an handle about 15 inches in length, and being furnished with a sharp point or claw, bending downwards from the back of its head; the blade whereof is formed like that of any other hatchet. It is principally employed in sea-fights to cut away and destroy the rigging of any adversary who endeavours to board.

Pole-axes are also said to have been successfully used on some occasions in boarding an enemy, whose sides were above those of the boarder. This is executed by detaching several gangs to enter at different parts of the ship's length, at which time the pole-axes are forcibly driven into her side, one above another, so as to form a sort of scaling-ladders.

POLE Cat. See MUSTELA.

POLE Star. See ASTRONOMY, n° 3. 17. and 39.

POLEIN, in English antiquity, is a sort of shoe, sharp or picked at the point. This fashion took its rise in the time of king William Rufus; and the picks were so long, that they were tied up to the knees with silver or golden chains. They were forbidden by stat. an. 4 Edw. IV. cap. *Tunc fluxus crinium, tunc luxus vestium, tunc usus calceorum cum arcuatis aculeis inventus est*. Malmesb. in Will. ii.

POLEMARCHUS was a magistrate at Athens, who had under his care all the strangers and sojourners in the city, over whom he had the same authority that the archon had over the citizens. It was his duty to offer a solemn sacrifice to Enyalus (said to be the same with Mars, though others will have it that he was only one of his attendants), and another to Diana, surnamed *Αγροτέρα*, in honour of the famous patriot Harmodius. It was also his business to take care that the children of those that had lost their lives in the service of their country should be provided for out of the public treasury.

POLEMICAL, in matters of literature, an appellation given to books of controversy, especially those in divinity.

POLEMO, who succeeded Zenocrates in the direction of the academy, was an Athenian of distinguished birth, and in the earlier part of his life a man of loose morals. The manner in which he was reclaimed from the pursuit of infamous pleasures, and brought under the discipline of philosophy, affords a memorable example of the power of eloquence employed in the cause of virtue. His history is thus related by Dr Enfield: "As he was, one morning about the rising of the sun, returning home from the revels of the night,

Polemo
||
Polenturg.

night clad in a loose robe, crowned with garlands, strongly perfumed, and intoxicated with wine, he passed by the school of Xenocrates, and saw him furrounded with his disciples. Unable to resist so fortunate an opportunity of indulging his sportive humour, he rushed without ceremony into the school, and took his place among the philosophers. The whole assembly was astonished at this rude and indecent intrusion, and all but Xenocrates discovered signs of resentment. Xenocrates, however, preserved the perfect command of his countenance; and with great presence of mind turned his discourse from the subject on which he was treating to the topics of temperance and modesty, which he recommended with such strength of argument, and energy of language, that Polemo was constrained to yield to the force of conviction. Instead of turning the philosopher and his doctrine to ridicule, as he at first intended, he became sensible of the folly of his former conduct; was heartily ashamed of the contemptible figure which he had made in so respectable an assembly; took his garland from his head; concealed his naked arm under his cloak; assumed a sedate and thoughtful aspect; and, in short, resolved from that hour to relinquish his licentious pleasures, and devote himself to the pursuit of wisdom. Thus was this young man, by the powerful energy of truth and eloquence, in an instant converted from an infamous libertine to a respectable philosopher. In such a sudden change of character it is difficult to avoid passing from one extreme to another. Polemo, after his reformation, in order to brace up his mind to the tone of rigid virtue, constantly practised the severest austerity and most hardy fortitude. From the thirtieth year of his age to his death he drank nothing but water. When he suffered violent pain, he showed no external sign of anguish. In order to preserve his mind undisturbed by passion, he habituated himself to speak in an uniform tone of voice, without elevation or depression. The austerity of his manners was, however, tempered with urbanity and generosity. He was fond of solitude, and passed much of his time in a garden near his school. He died, at an advanced age, of a consumption. Of his tenets little is said by the ancients, because he strictly adhered to the doctrine of Plato."

POLEMONIUM, GREEK VALERIAN, or *Jacob's Ladder*: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 29th order, *Campanaceæ*. The corolla is quinquepartite; the stamina inserted into scales which close the bottom of the corolla; the stigma is trifid: the capsule bilocular superior. There are two species, of which the most remarkable is the cœruleum, with an empalement longer than the flower. It grows naturally in some places of England: however, its beauty has obtained it a place in the gardens. There are three varieties; one with a white, another with a blue, and another with a variegated flower; also a kind with variegated leaves. They are easily propagated by seeds; but that kind with variegated leaves is preserved by parting its roots, because the plants raised from seeds would be apt to degenerate and become plain.

POLEMOSCOPE, in optics, the same with **OPERA-GLASS**. See **DIOPTRICS**, p. 37. col. 1. par. 3.

POLENBURG (Cornelius), an excellent painter of little landscapes and figures, was born at Utrecht in 1586, and educated under Blomaert, whom he soon

VOL. XV.

quitted to travel into Italy; and studied for a long time in Rome and Florence, where he formed a style entirely new, which, though preferable to the Flemish, is unlike any Italian, except in his having adorned his landscapes with ruins. There is a varnished smoothness and finishing in his pictures, that render them always pleasing, though simple and too nearly resembling one another. The Roman cardinals were charmed with the neatness of his works, as was also the great duke; but could not retain him. He returned to Utrecht, and pleased Rubens, who had several of his performances. King Charles I. invited him to London, where he generally painted the figures in Steenwyck's perspectives: but the king could not prevail on him to fix there; for after staying only four years, and being handsomely rewarded by his majesty for several pieces which he performed for him, he returned to Utrecht, and died there at the age of 74. His works are very scarce and valuable.

POLERON, one of the Banda or nutmeg islands in the East Indies. This was one of those spice islands which put themselves under the protection of the English, and voluntarily acknowledged James I. king of England for their sovereign; for which reason the natives of this and the rest of the islands were murdered or driven thence by the Dutch, together with the English.

POLESIA, a province of Poland, bounded by Polachio and Proper Lithuania on the north, and by Volhinia on the south. It is one of the palatinates of Lithuania, and is commonly called *Brescia*, and its capital is of this name. It is full of forests and lakes.

POLESINO-DE-ROVIGO, a province of Italy, in the republic of Venice, lying to the north of the river Po; and bounded on that side by the Paduan, on the south by the Ferrarese, on the East by Degado, and on the west by the Veronese. It is 45 miles in length, and 17 in breadth, and is a fertile country. Rovigo is the capital.

POLETÆ were ten magistrates of Athens, who, with three that had the management of money allowed for public shows, were empowered to let out the tribute-money and other public revenues, and to sell confiscated estates; all which bargains were ratified by their president, or in his name. They were by their office also bound to convict such as had not paid the tribute called *ΜΕΤΟΙΚΙΟΝ*, and sell them in the market by auction. The market where these wretches were sold was called *ΠΟΛΙΤΗΡΙΟΝ ΤΗΣ ΜΕΤΟΙΚΙΑΣ*.

POLIANTHES, the **TUBEROSE**: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 10th order, *Coronariæ*. The corolla is funnel-shaped, incurvated, and equal; the filaments are inserted into the throat of the corolla; in the bottom of which the germen is situated. There is but one species, consisting of some varieties; all of which being exotics of tender quality, require aid of artificial heat, under shelter of frames and glasses, &c. to bring them to flower in perfection in cold countries. The polianthes, or tuberose, hath an oblong, bulb-like, tuberous, white root; crowned with a few long very narrow leaves; amidst them an upright, straight, firm stem, three or four feet high, terminated by a long spike of large white flowers arranged alternately. The varieties are the common tu-

R r

berose,

Poleron
||
Polianthes.

Polianthes. berose, with single flowers,—double-flowered,—dwarf-stalked,—variegated-leaved. They all flower here in June, July, and August: the flowers are funnel or bell shaped; garnish the upper part of the stem in a long spike, consisting of from 10 to 20 or more separate in alternate arrangements, the lower flowers opening first, which are succeeded by those above, in regular order, making in the whole a most beautiful appearance, highly enriched with a most fragrant odour. The common single-flowered tuberose is the sort the most commonly cultivated, as it generally blows the most freely, and possesses the finest fragrance. The double-flowered kind also highly merits culture, as when it blows fair it makes a singularly fine appearance. The dwarf and the variegated kinds are inferior to the other two, but may be cultivated for variety.

All the varieties being exotics from warm countries, although they are made to flower in great perfection in British gardens by assistance of hot-beds, they will not prosper in the open ground, and do not increase freely in England; so that a supply of the roots is imported thither annually from Genoa, and other parts of Italy, by most of the eminent nursery and seedsmen, and the Italian warehouse-keepers; generally arriving in February or March, time enough for the ensuing summer's bloom; and are sold commonly at the rate of twelve or fifteen shillings per hundred, being careful always to procure as large roots as possible, for on this depends the success of having a complete blow. They, requiring artificial heat to blow them in cold countries, are planted in pots, and plunged in a hot-bed, under a deep frame furnished with glass lights; or placed in a hot-house, where they may be blown to great perfection with little trouble. The principal season for planting them is March and April: observing, however, that in order to continue a long succession of the bloom, it is proper to make two or three different plantings, at about a month interval; one in March, another in April, and a third the beginning of May, whereby the blow may be continued from June until September; observing, as above-mentioned, they may be flowered either by aid of a common dung or bark hot-bed, or in a hot-house.

With respect to the propagation of these plants, it is principally by offsets of the roots. The blowing roots that are brought annually from abroad for sale are often furnished with offsets, which ought to be separated previous to planting. Those also that are planted in the gardens frequently furnish offsets fit for separation in autumn when the leaves decay; they must then be preserved in sand all winter in a dry sheltered place; and in the beginning of March, plant them either in a bed of light dry earth in the full ground; or, to forward them as much as possible, allow them a moderate hot-bed; and in either method indulge them with a shelter in cold weather, either of a frame and lights, or arched with hoops and occasionally matted; but let them enjoy the full air in all mild weather, giving also plenty of water in dry weather during the season of their growth in spring and summer. Thus let them grow till their leaves again decay in autumn: then take them up, clean them from earth, and lay them in sand till spring; at which time such roots as are large enough to blow may be planted and managed as already directed, and the smaller roots planted again in a nursery-bed, to have another year's growth; after-

wards plant them for flowering. The Egyptians put the flowers of tuberose into sweet oil; and by this means give it a most excellent flavour, scarce inferior to oil of jasmine.

POLICANDRO, a small island in the Archipelago, seated between Milo and Mergo. It has no harbour, but has a town about three miles from the shore near a huge rock. It is a ragged stony island, but yields as much corn as is sufficient for the inhabitants, who consist of about 120 Greek families, all Christians. The only commodity is cotton; of which they make napkins, a dozen of which are sold for a crown. E. Long. 35. 25. N. Lat. 36. 36.

POLICASTRO, an episcopal town of Italy, in the kingdom of Naples, and in the Hither Principato; but now almost in ruins, for which reason the bishop resides in another town. E. Long. 15. 46. N. Lat. 40. 26.

POLICY, or **POLITY**, in matters of government. See **POLITY**.

Policy of Insurance, or *Assurance*, of ships, is a contract or convention, whereby a person takes upon himself the risks of a sea-voyage; obliging himself to make good the losses and damages that may befall the vessel, its equipage, tackle, victualling, lading, &c. either from tempests, shipwrecks, pirates, fire, war, reprisals, in part or in whole; in consideration of a certain sum of seven, eight, or ten *per cent.* more or less according to the risk run; which sum is paid down to the assurer by the assured upon his signing the policy. See **INSURANCE**.

POLIDORO DA CARAVAGGIO, an eminent painter, born at Caravaggio in the Milanese in 1492. He went young to Rome, where he worked as a labourer in preparing stucco for the painters; and was so animated by seeing them at work in the Vatican, that he solicited some of them to teach him the rules of designing. He attached himself particularly to Maturino, a young Florentine; and a similarity in talents and taste producing a disinterested affection, they associated like brothers, laboured together, and lived on one common purse, until the death of Maturino. He understood and practised the *chiaro-scuro* in a degree superior to any in the Roman school; and finished an incredible number of pictures both in fresco and in oil, few of the public buildings at Rome being without some of his paintings. Being obliged to fly from Rome when it was stormed and pillaged, he retired to Messina, where he obtained a large sum of money with great reputation, by painting the triumphal arches for the reception of Charles V. after his victory at Tunis; and when he was preparing to return to Rome, he was murdered, for the sake of his riches, by his Sicilian valet with other assassins, in the year 1543.

POLIFOLIA. See **ANDROMEDA**.

POLIGNAC (Melchier de), an excellent French genius and a cardinal, was born of an ancient and noble family at Puy, the capital of Velay, in 1662. He was sent by Louis XIV. ambassador extraordinary to Poland, where, on the death of Sobieski, he formed a project of procuring the election of the prince of Conti. But failing, he returned home under some disgrace; but when restored to favour, he was sent to Rome as auditor of the Rota. He was plenipotentiary during the congress at Utrecht, at which time Clement I. created him a cardinal; and upon the accession of Louis XV. he was appointed to reside at Rome as minister of France.

Policandro
||
Polignac.

Polisher France. He remained there till the year 1732, and died in the year 1741. He left behind him a MS. poem entitled *Anti-Lucretius, seu De Deo et Natura*; the plan of which he is said to have formed in Holland in a conversation with Mr Bayle. This celebrated poem was first published in the year 1749, and has since been several times printed in other countries besides France. He had been received into the French Academy in 1704, into the Academy of Sciences in 1715, into that of the Belles Lettres in 1717: and he would have been an ornament to any society, having all the accomplishments of a man of parts and learning.

POLISHER, or **BURNISHER**, among mechanics, an instrument for polishing and burnishing things proper to take a polish. The gilders use an iron-polisher to prepare their metals before gilding, and the blood-stone to give them the bright polish after gilding.

The polishers, among cutlers, are a kind of wooden wheels made of walnut-tree, about an inch thick, and of a diameter at pleasure, which are turned round by a great wheel; upon these they smooth and polish their work with emery and putty.

The polishers for glass consist of two pieces of wood; the one flat, covered with old hat; the other long and half-round, fastened on the former, whose edge it exceeds on both sides by some inches, which serves the workmen to take hold of, and to work backwards and forwards by.

The polishers used by spectacle-makers are pieces of wood a foot long, seven or eight inches broad, and an inch and a half thick, covered with old beaver hat, whereon they polish the shell and horn frames their spectacle-glasses are to be set in.

POLISHING, in general, the operation of giving a gloss or lustre to certain substances, as metals, glass, marble, &c.

The operation of polishing optic-glasses, after being properly ground, is one of the most difficult points of the whole process. See **TELESCOPE**.

POLITENESS means elegance of manners or good breeding: Lord Chesterfield calls it the art of pleasing. It has also been called an artificial good nature; and indeed good nature is the foundation of true politeness; without which art will make but a very indifferent figure, and will generally defeat its own ends. "Where compliance and assent, caution and candour, says an elegant essayist*, arise from a natural tenderness of disposition and softness of nature, as they sometimes do, they are almost amiable and certainly excusable; but as the effects of artifice, they must be despised. The persons who possess them are, indeed, often themselves dupes of their own deceit, when they imagine others are deluded by it. For excessive art always betrays itself; and many, who do not openly take notice of the deceiver, from motives of delicacy and tenderness for his character, secretly deride and warmly resent his ineffectual subtlety."

* Dr Knox,

† Beauties of History.

"True politeness (says another author†) is that continual attention which humanity inspires us with, both to please others, and to avoid giving them offence. The surly plain-dealer exclaims loudly against this virtue, and prefers his own shocking bluntness and Gothic freedom. The courtier and fawning flatterer, on the contrary, substitute in its place insipid compliments, cringings, and a jargon of unmeaning sentences. The one blames polite-

ness, because he takes it for a vice; and the other is the occasion of this, because that which he practises is really so."

Both these characters act from motives equally absurd, though not equally criminal. The conduct of the artful flatterer is guided by self-love, while that of the plain-dealer is the effect of ignorance; for nothing is more certain, than that the desire of pleasing is founded on the mutual wants and the mutual wishes of mankind; on the pleasure which we wish to derive from society, and the character which we wish to acquire. Men having discovered that it was necessary and agreeable to unite for their common interests, they have made laws to repress the wicked, they have settled the duties of social life, and connected the idea of respectability with the practice of those duties; and after having prescribed the regulations necessary to their common safety, they have endeavoured to render their commerce with one another agreeable, by establishing the rules of politeness and good breeding. Indeed, as an elegant author already quoted remarks, the philosopher who, in the austerity of his virtue, should condemn the art of pleasing as unworthy cultivation, would deserve little attention from mankind, and might be dismissed to his solitary tub, like his brother Diogenes. It is the dictate of humanity, that we should endeavour to render ourselves agreeable to those in whose company we are destined to travel in the journey of life. It is our interest, it is the source of perpetual satisfaction; it is one of our most important duties as men, and particularly required in the professor of Christianity."

It is needless to particularize the motives which have induced men to practise the agreeable virtues; for, from whatever source the desire of pleasing proceeds, it has always increased in proportion to the general civilization of mankind. In a rude state of society, pleasure is limited in its sources and in its operation. When the wants of mankind, and the means of attaining them, are few, personal application is necessary to gratify them, and it is generally sufficient; by which means an individual becomes more independent than can possibly be the case in civilized life, and of course less disposed to give or receive assistance. Confined to the solitary wish of furnishing means for his own happiness, he is little intent on the pleasures of conversation and society. His desire of communication is equal to the extent of his knowledge. But as soon as the natural wants of life are filled up, we find unoccupied time, and we labour hard to make it pass in an agreeable manner. It is then we perceive the advantage of possessing a rational nature, and the delights of mutual intercourse. When we consider society in that state of perfection which enables a great part of the members of it to pursue at leisure the pleasures of conversation, we should expect, both from the ease of acquitting ourselves to the satisfaction of our associates, and from the advantages arising from this conduct, that the art of pleasing might be reduced to a few plain and simple rules, and that these might be derived from a slight attention to general manners.

The art of pleasing, in our intercourse with mankind, is indeed so simple, that it requires nothing more than the constant desire to please in all our words and actions; and the practice of it can neither wound a man's self-love, nor be prejudicial to his interest in any possible situation.

Politeness. But though this be certain, it is doubtless less attended to than in reason it ought to be. Each particular man is so zealous to promote his own ends or his own pleasure, as to forget that his neighbour has claims equal to his own; that every man that enters into company gives up for the time a great many of his peculiar rights; and that he then forms part of an association, met together not for the particular gratification of any one, but for the purpose of general satisfaction. See BREEDING, CONVERSATION, and Good MANNERS.

The qualities essential in the art of pleasing, are *virtue, knowledge, and manners*. All the virtues which form a good and respectable character in a moral sense are essential to the art of pleasing. This must be an established principle, because it depends on the wants and mutual relations of society. In all affairs of common business, we delight in transacting with men in whom we can place confidence, and in whom we find integrity; but truth is so naturally pleasing, and the common affairs of life are so interwoven with social intercourse, that we derive abundantly more satisfaction from an honest character than from specious manners. "Should you be suspected (says Chesterfield) of injustice, malignity, perfidy, lying, &c. all the parts and knowledge of the world will never procure you esteem, friendship, and respect."

The first of virtues in our commerce with the world, and the chief in giving pleasure to those with whom we associate, is inviolable sincerity of heart. We can never be too punctual in the most scrupulous tenderness to our moral character in this respect, nor too nicely affected in preserving our integrity.

The peculiar modes, even of the fashionable world, which are founded in dissimulation, and which on this account have induced several to recommend the practice, would not prevent a man of the highest integrity from being acceptable in the very best company. Acknowledged sincerity gives the same ornament to character that modesty does to manners. It would abundantly atone for the want of ridiculous ceremony, or false and unmeaning professions; and it would in no respect diminish the lustre of a noble air, or the perfection of an elegant address.

If integrity be the foundation of that character which is most generally acceptable, or which, in other words, possesses the power of pleasing in the highest degree, humanity and modesty are its highest ornaments.

The whole art of pleasing, as far as the virtues are concerned, may be derived from the one or other of these sources. Humanity comprehends the display of every thing amiable to others; modesty removes or suppresses every thing offensive in ourselves.

This modesty, however, is not inconsistent with firmness and dignity of character: it arises rather from the knowledge of our imperfection compared with a certain standard, than from conscious ignorance of what we ought to know. We must therefore distinguish between this modesty and what the French call *mauvaise honte*. The one is the unaffected and unassuming principle which leads us to give preference to the merit of others, the other is the awkward struggling of nature over her own infirmities. The first gives an additional lustre to every good quality; while some people, from feeling the pain and inconveniency of the *mauvaise honte*, have rushed into the other extreme, and turned

impudent, as cowards sometimes grow desperate from excess of danger. The medium between these two extremes marks out the well-bred man; he feels himself firm and easy in all companies, is modest without being bashful, and steady without being impudent.

A man possessing the amiable virtues is still farther prepared to please, by having in his own mind a perpetual fund of satisfaction and entertainment. He is put to no trouble in concealing thoughts which it would be disgraceful to avow, and he is not anxious to display virtues which his daily conversation and his constant looks render visible.

The next ingredient in the art of pleasing, is to possess a correct and enlightened understanding, and a fund of rational knowledge. With virtue and modesty we must be able to entertain and instruct those with whom we associate.

The faculty of communicating ideas is peculiar to man, and the pleasure which he derives from the interchange alone is one of the most important of his blessings. Mankind are formed with numberless wants, and with a mutual power of assisting each other. It is a beautiful and happy part of the same perfect plan, that they are likewise formed to delight in each other's company, and in the mutual interchange of their thoughts. The different species of communication, in a highly polished age, are as numerous as the different ranks, employments, and occupations of men; and indeed the knowledge which men wish to communicate, takes its tinge from their peculiar profession or occupation.

Thus commercial men delight to talk of their trade, and of the nature of public business; men of pleasures, who wish merely to vary or quicken their amusements, are in conversation light, trifling, and insincere; and the literati delight to dwell on new books, learned men, and important discoveries in science or in arts. But as the different classes of men will frequently meet together, all parties must so contrive matters, as to combine the useful and agreeable together, so as to give the greatest delight at the time, and the greatest pleasure on reflection. An attention to these principles would make the man of pleasure and the man of learning meet together on equal terms, and derive mutual advantage from their different qualifications. With due attention to such ideas, we proceed to mention the kinds of knowledge which are most fitted for conversation. Those who wish to please should particularly endeavour to be informed in those points which most generally occur. An accurate or extensive knowledge on learned subjects is by no means sufficient: we must also have an accurate and extensive knowledge of the common occurrences of life.

It is the knowledge of mankind, of governments, of history, of public characters, and of the springs which put the great and the little actions of the world in motion, which give real pleasure and rational instruction. The knowledge which we communicate must in some shape be interesting to those to whom we communicate it; of that nature, that the desire of receiving it may overbalance every kind of disgust, excited too often on the score of envy and self-love, against those who happen to possess superior endowments, and at the same time of that importance, as to elevate the thoughts somewhat above the actions and the faults of the narrow circle formed in our own immediate neighbourhood.

Politeness, bourhood. On this account it is recommended by an author who fully knew mankind, as a maxim of great importance in the art of pleasing, to be acquainted with the private character of those men who, from their station or their actions, are making a figure in the world. We naturally wish to see such men in their retired and undisguised moments; and he who can gratify us is highly acceptable. History of all kinds, fitly introduced, and occasionally embellished with pleasing anecdotes, is a chief part of our entertainment in the intercourse of life. This is receiving instruction, without exciting much envy; it depends on memory, and memory is one of those talents the possession of which we least grudge to our neighbour. Our knowledge of history, at the same time, must not appear in long and tedious details; but in apt and well chosen allusions, calculated to illustrate the particular subject of conversation. But the knowledge most necessary is that of the human heart. This is acquired by constant observation on the manners and maxims of the world, connected with that which passes in our own minds. This leads us from the common details of conduct, from slander and defamation, to the sources and principles of action, and enables us to enter into what may be called the philosophy of conversation. We may see both the practicability of this kind of discourse, and the nature of it, in the following lines of Horace:

Sermo oritur, non de villis domibusve alienis;
Nec male necne Lepos saltet: sed quod magis ad nos
Pertinet, & nescire malum est, agitur: utrumne
Divitiis homines, an sint virtute beati?
Quidve ad amicitias, usus rectumne, trahat nos?
Et quæ sit natura boni, summumque quid ejus? &c.

By this means constant materials are supplied for free, easy, and spirited communication. The restraints which are imposed on mankind, either from what their own character may suffer, or from the apprehension of giving offence to others, are entirely taken off, and they have a sufficient quantity of current coin for all the common purposes of life.

In addition to virtue and knowledge, which are the chief ingredients in the art of pleasing, we have to consider graceful and easy manners. Lord Chesterfield indeed considers these as the most essential and important part; as if the diamond received its whole value from the polish. But though he is unquestionably mistaken, there is yet a certain sweetness of manners which is particularly engaging in our commerce with the world. It is that which constitutes the character which the French, under the appellation of *Paimable*, so much talk of, and so justly value. This is not so easily described as felt. It is the compound result of different things; as complaisance, a flexibility, but not a servility of manners, an air of softness in the countenance, gesture, and expression, equally whether you concur or differ with the person you converse with. This is particularly to be studied when we are obliged to refuse a favour asked of us, or to say what in itself cannot be very agreeable to the person to whom we say it. It is then the necessary gilding of a disagreeable pill. But this, which may be called the *suaviter in modo*, would degenerate and sink into a mean and timid complaisance and passiveness, if not supported by firmness and dignity of character. Hence the Latin sentence, *suaviter in modo*,

fortiter in re, becomes an useful and important maxim in Politeness.

Genuine easy manners result from a constant attention to the relations of persons, things, time, and places. Were we to converse with one greatly our superior, we are to be as easy and unembarrassed as with our equals; but yet every look, word, and action, should imply, without any kind of servile flattery, the greatest respect. In mixed companies, with our equals, greater ease and liberty are allowed; but they too have their proper limits. There is a social respect necessary. Our words, gestures, and attitudes, have a greater degree of latitude though not an unbounded one. That easiness of carriage and behaviour which is exceedingly engaging, widely differs from negligence and inattention, and by no means implies that one may do whatever he pleases; it only means, that one is not to be stiff, formal, and embarrassed, disconcerted and ashamed; but it requires great attention to, and a scrupulous observation of, what the French call *les bienséances*; a word which implies "decorum, good-breeding, and propriety." Whatever we ought to do, is to be done with ease and unconcern; whatever is improper, must not be done at all. In mixed companies, also, different ages and sexes are to be differently addressed. Although we are to be equally easy with all, old age particularly requires to be treated with a degree of deference and regard. It is a good general rule, to accustom ourselves to have a kind feeling to every thing connected with man; and when this is the case, we shall seldom err in the application. Another important point in the *bienséances* is, not to run our own present humour and disposition indiscriminately against every body, but to observe and adapt theirs. And if we cannot command one present humour and disposition, it is necessary to single out those to converse with who happen to be in the humour the nearest to our own. Peremptoriness and decision, especially in young people, is contrary to the *bienséances*: they should seldom seem to dissent, and always use some softening mitigating expression.

There is a *bienséance* also with regard to people of the lowest degree; a gentleman observes it with his footman, and even indeed with the beggar in the street. He considers them as objects of compassion, not of insult; he speaks to neither in a harsh tone, but corrects the one coolly, and refuses the other with humanity.

The following observations perhaps contain the sum of the art of pleasing:

1. A fixed and habitual resolution of endeavouring to please, is a circumstance which will seldom fail of effect, and its effect will every day become more visible as this habit increases in strength.

2. This resolution must be regulated by a very considerable degree of good sense.

3. It is a maxim of almost general application, that what pleases us in another will also please others in us.

4. A constant and habitual attention to the different dispositions of mankind, to their ruling passions, and to their peculiar or occasional humours, is absolutely necessary.

5. A man who would please, must possess a firm, equal, and steady temper. And,

6. An easy and graceful manner, as distant from bashfulness on the one hand as from impudence on the other.

Politeness,
Politian.

other. "He who thinks himself sure of pleasing (says Lord Chesterfield), and he who despairs of it, are equally sure to fail." And he is undoubtedly in the right. The one, by his assuming vanity, is inattentive to the means of pleasing; and the other, from fear, is rendered incapable of employing them.

A variety of excellent rules for acquiring politeness, with strictures on particular kinds of impoliteness, may be found in the *Spectator*, *Rambler*, *Idler*, *Lounger*, *Mirror*, and other periodical works of that kind; in *Knox's Essays*, and among *Swift's Works*; see *Good Manners*. *Chesterfield's Art of Pleasing*, and his *Letters*, are also worthy of perusal, provided the reader be on his guard against the insincerity and other vices which those books are calculated to infuse, and provided he always bears in mind what we have endeavoured to show in this article, that true politeness does not consist in specious manners and a dissimulating address, but that it must always be founded on real worth and intrinsic virtue.

POLITIAN (Angelo), was born at Monte Pulciano in Tuscany in 1454. He learned the Greek tongue, of which he became a complete master, under Andronicus of Thessalonica. He is said to have written verses both in Greek and Latin when he was not more than 12 years of age. He studied also the Platonic philosophy under Marfilus Finicus, and that of Aristotle under Argyropylus. He was one of the most learned and polite writers of his time. The first work which gained him a reputation was a poem on the tournament of Julian de Medicis. The account he wrote some time after of the conspiracy of the Pazzi's was very much esteemed. He wrote many other pieces which have merited approbation; and had he lived longer, he would have enriched the republic of letters with many excellent works; but he died at the age of 40 years. His morals answered the homeliness of his face rather than the beauty of his genius; for Paul Jovius informs us, that "he was a man of awkward and perverse manners, of a countenance by no means open and liberal, a nose remarkably large, and squinting eyes. He was crafty, satirical, and full of inward malice; for his constant way was, to sneer and ridicule the productions of other men, and never to allow any criticism, however just, upon his own."

He was, nevertheless, as all acknowledge, a man of most consummate erudition; and not only so, but a very polite and elegant writer. Erasmus, in his *Ciceronianus*, calls him a rare miracle of nature, on account of his excelling in every kind of writing: his words are remarkable: "*Fateor Angelum prorsus angelica fuisse mente, rarum naturæ miraculum, ad quodcunque scripti genus applicaret animum.*" Some of his poems were so much admired, that several learned men have made it their business to comment on them. It has been often reported that he spoke of the Bible with great contempt; and that, having read it but once, he complained he had never spent his time so ill. But this is not probable, for it must be remembered that he was a priest and canon of Florence; and we learn from one of his Epistles that he preached a whole Lent. It does not indeed follow hence, that he did not think contemptuously of the Bible, because many of his church, especially among the better sort, have not been very good believers, and he might be one of them: but it is not likely he would speak out so freely. "I could

(as Bayle says) much more easily believe the judgment he is said to have made on the Psalms of David and the Odes of Pindar: he did not deny that there are many good and fine things in the Psalms; but he pretended that the same things appear in Pindar with more brightness and sweetness." The two Scaligers have spoken highly of Politian: the elder has preferred a consolatory elegy of his to that which Ovid sent to Livy upon the death of Drusus, and says, he had rather have been the author of it: the younger calls him an excellent poet, but thinks the style of his epistles too elated and declamatory.

His works have been printed at various times, and in various places: his epistles have probably been most read, because these are things which the generality of people are best pleased with.

POLITICAL, from πολις "a city," signifies any thing that relates to policy or civil government.

POLITICAL Arithmetic, is the art of reasoning by figures upon matters relating to government, such as the revenues, number of people, extent and value of land, taxes, trade, &c. in any nation.

These calculations are generally made with a view to ascertain the comparative strength, prosperity, &c. of any two or more nations. With this view, Sir William Petty, in his *Political Arithmetic*, p. 74, &c. computes the land of Holland and Zealand to be about 1,000,000 acres, and that of France to be 8,000,000; and yet the former is one-third part as rich and strong as the latter. The shipping of Europe he computes to be about 2,000,000, of which Britain has 500,000; Holland 900,000; France 100,000; Hamburgh, Denmark, Sweden, and Dantzic 250,000; and Spain, Portugal, Italy, &c. the rest. The exports of France he computes at L. 5,000,000, of which one-fourth came to Britain; of Holland L. 18,000,000, of which L. 300,000, came to Britain. The money raised yearly by the king of France was about L. 6,500,000 Sterling; that of all the Dutch provinces L. 3,000,000, of which 2,100,000 was raised in Holland and Zealand. The number of people in England he computed to be six millions, and their expences, at L. 7 *per annum* a head, L. 42,000,000; the rent of land L. 8,000,000; and the interests, &c. of personal estates as much, the rents of houses L. 4,000,000, and the profits of labour, L. 26,000,000. The people of Ireland he reckoned 1,200,000. The corn spent in England, at 5s. a bushel for wheat, and 2s. 6d. for barley, amounts to L. 10,000,000 a-year. The navy of England then required 36,000 men to man it, and other trade and shipping 48,000. In France, to manage the whole shipping trade, there were then required only 1500 men. The whole people of France were 13,500,000; and those of England, Scotland, and Ireland, about 9,500,000. In the three kingdoms are about 20,000 churchmen, and in France more than 270,000. In the dominions of England were above 40,000 seamen, and in France not more than 10,000. In England, Scotland, and Ireland, and all their dependencies, there was then about 60,000 ton of shipping, worth about 4,500,000 in money. The sea-line round England, Scotland, and Ireland, and the adjacent isles, is about 3800 miles. In the whole world he reckoned about 350,000,000 of people; and those with whom the English and Dutch have any commerce, not more than eighty millions; and the value of commodities

Political,
Political
Arithmetic

Political
Arithmetic

commodities annually traded for in the whole not above L. 45,000,000. That the manufactures exported from England amounted to about L. 5,000,000 *per annum*; lead, tin, and coals, to L. 500,000 *per annum*. The value of the French commodities then brought into England did not exceed L. 1,200,000 *per annum*; and the whole cash of England in current money was then about L. 6,000,000 Sterling.

With these calculations Dr Davenant was dissatisfied; and therefore, from the observations of Mr Greg. King, he advanced others of his own. He reckons the land of England 39 millions of acres; the number of people 5 millions and a half, increasing 9000 a year, making allowance for wars, plagues, and other accidents. He reckons the inhabitants of London 530,000; of other cities and market-towns in England 870,000; and those of villages, &c. 4,100,000. The yearly rent of land he reckons L. 10,000,000; of houses, &c. 2,000,000; the produce of all kinds of grain in a tolerable year L. 9,075,000; the annual rent of corn lands L. 2,200,000, and their net produce L. 9,000,000; the rent of pasture, meadows, woods, forests, commons, heaths, &c. L. 7,000,000; the annual produce by cattle in butter, cheese, and milk, about L. 2,500,000; the value of the wool yearly shorn about L. 2,000,000; of horses yearly bred about L. 250,000; of the flesh yearly spent as food about L. 3,350,000; of the tallow and hides about L. 600,000; of the hay yearly consumed by horses about L. 1,300,000; of the hay consumed by other cattle L. 1,000,000; of the timber yearly felled for building L. 500,000; and of the wood yearly spent in firing, &c. about L. 500,000. The proportion of the land of England to its inhabitants is now about $7\frac{1}{4}$ acres per head; the value of the wheat, rye, and barley, necessary for the sustenance of England, amounts to at least L. 6,000,000 Sterling *per annum*; of the woollen manufacture about L. 8,000,000 *per annum*, and exports of all kinds of the woollen manufacture amount to above L. 2,000,000 *per annum*; the annual income of England, on which the whole people subsist, and out of which all taxes are paid, is reckoned to be about L. 43,000,000, that of France L. 81,000,000, and of Holland L. 13,250,000. See Davenant's *Essay on Trade*, in vol. vi. of his works. For calculations respecting mortality, see Major Grant's *Observations on the Bills of Mortality*, and our article *Bills of Mortality*.

In Vol. XLIX. of the Philosophical Transactions we have an estimate of the number of people in England by Dr Brakenridge, from considering the number of houses and quantity of bread consumed. On the former principle he computes the number of people to be 6,257,418 of all ages, counting in England and Wales 911,310 houses, and allowing six persons to a house. From a survey of the window-lights after the year 1750, the number of houses charged in England and Wales were 690,000, besides 200,000 cottages that pay nothing; the whole number therefore was 890,000, and the number of people, allowing six to a house, 5,340,000. On the latter principle, he estimates the number of quarters of wheat consumed at home to be 2,026,100; and allowing a quarter for three persons in a year, or seven ounces a day for each person, he concludes the number of people to be 6,078,300. Of this number, according to Dr Halley's rule, he suppo-

ses about 1,500,000 men able to carry arms. The country he supposes capable of supporting one-half more inhabitants, or 9,000,000; for, according to Mr Templeman's survey, England contains 49,450 square miles, that is, 31,648,000 acres, of which 25,300,000 acres are proper to be cultivated; and allowing three acres, well manured, for the maintenance of one person, there will be maintenance in England for 8,430,000 people; to which add the produce of fishing, and it will enable the country to support 9,000,000. In Ireland, Mr Templeman reckons 17,536,000 acres, of which Dr Brakenridge thinks 12,000,000 are capable of cultivation; and allowing four acres to each person, and the number of inhabitants to be only 1,000,000, Ireland could maintain 2,000,000 more people than it has now. In Scotland, containing 1,500,000 people, and 17,728,000 acres of land, of which there are 11,000,000 good acres, allowing five for each person, he supposes there may be provision for 2,200,000 people, or for 700,000 more than there are at present. Hence he infers, that were both the British isles properly cultivated, there is a provision for 6,000,000 inhabitants beyond the present number. Extending his survey to the whole globe, he supposes the whole surface to be to the quantity of land as 8 to 3, *i. e.* as 197,819,550 to 74,182,331 square miles; out of which, deducting one-third for waste-ground, there will be 49,454,887 square miles, or 31,651,127,680 good acres. And stating the whole number of inhabitants on the globe to be 400,000,000, there will be 79 good acres to each person. See Dr Halley's *Calculations* on the same subject, and Dr Price's (for a list of whose works see his life at the Word PRICE), and King on the *National Debt*.

POLITICS, the first part of economy or ethics, consisting in the well governing and regulating the affairs of a state for the maintenance of the public safety, order, tranquillity, and morals.

Lord Bacon divides politics into three parts, *viz.* the preservation of the state, its happiness and flourishing, and its enlargement. Of the first two, he informs us, various authors have treated, but the last has never been handled; and he has given a specimen of an essay to supply the want.

POLITY, or POLICY, denotes the peculiar form and constitution of the government of any state or nation; or the laws, orders, and regulations, relating thereto*.—Polity differs only from politics, as the theory from the practice of any art.

* See Government.

Of the nature of our social duties, both private and political, we have already spoken at some length (see *MORAL Philosophy*, Part II. chap. iii. and particularly sect. vii.); and we shall have occasion to take a view of the origin and nature of the several political establishments of Europe, &c. hereafter. (See *Civil Society*.) We shall only further remark in this place upon the necessity of always joining politics and morality together. This view of the subject is indeed antiquated and neglected; but the connection has always been externally respected even by those who have separated them the most widely. Politics and morality, far from standing in opposition to each other, have the most intimate connection, and exhibit the relation which the *part* bears to the *whole*; that is to say, that politics are only a part or a branch of morality. No truth can be more evident than this; for

Political
Arithmetic
||
Polity.

Poll
||
Pollentia.

for as morality is the guide of human life, the principle of order, and the universal source of real improvement and genuine happiness to all mankind, every thing relative to the direction of individuals, or the government of nations, must be comprehended within its sphere, and be subservient to its laws. All the schemes and projects of pretended political wisdom, that deviate from or violate the rules of this master-science, turn out in the issue often to the detriment of their contrivers, always to that of the nation; and it is a palpable and absurd error to think of advancing the happiness of one country at the expence of the general good of mankind. The experience of ages, and the history of the world, confirm these assertions; from which, and from daily observation, we obtain a convincing proof of the wisdom of the good old maxim, both in its application to individuals and to nations, that "honesty is the best policy." See Baron Dahlberg's *Considerations on the Connection between Morality and Politics*, read by himself to the Academy of Sciences at Erfurt.

POLL, a word used in ancient writings for the head: hence to poll, is either to vote, or to enter down the names of those persons who give their votes at an election.

POLL-Evil. See FARRIERY, § xxxii.

POLL-Money, or *Capitation*, a tax imposed by authority of the British parliament on the person or head; either on all indifferently, or according to some known mark or distinction, as quality, calling, &c.

Thus, by the statute 18 Car. II. every subject in the kingdom was assessed by the head, or poll, according to his degree; every duke L.100, marquis L.80, baronet L.30, knight L.20, esquire L.10, &c. and every single private person 12d.

This was no new tax, as appears by former acts of parliament.

POLLACHIUS, or POLLACK. See GADUS.

POLLARD, or CROCARD, the name of a sort of base money current in Ireland in the time of Edward I. See *Simon's History of Irish Coins*, p. 15.

POLLEN, the fecundating or fertilizing dust contained within the antheræ or tops of the stamina, and dispersed upon the female organ when ripe for the purposes of impregnation. See BOTANY.

This dust, corresponding to the seminal fluid in animals is commonly of a yellow colour; and is very conspicuous in the summits of some flowers, as the tulip and lily. Its particles are very minute, and of extreme hardness. Examined by the microscope, they are generally found to assume some determinate form, which often predominates, not only through all the species of a particular genus, but also through the genera of a natural family or order. The powder in question being triturated, and otherwise prepared in the stomach of bees, by whom great quantities are collected in the hairy brushes with which their legs are covered, is supposed by some authors to produce the substance known by the name of *wax*; a species of vegetable oil, rendered concrete by the presence of an acid, which must be removed before the substance can be rendered fluid.

POLLENTIA, a town or colony of Roman citizens in the Balearis Major. It is now said to be Alcudia, situated on the north-east side of the island Majorca. There was another *Pollentia* of the Picenum, likewise a colony. It is thought to be either the same

Pollux
||
Pollio.

with or near to the Urbs Salvia, but is now extinct. There was a third of Liguria, situated at the confluence of the Stura and Tanarus. Suetonius calls it a municipium, and the people *Pollentina Plebs*. It was famous for its abundance of black fleeces; but was afterwards, under Arcadius and Honorius, stained with a defeat rather of the Romans under Stilico than of the Goths under Alaricus, though palliated by Claudian the poet; after which Rome was taken and set on fire. It is now called *Solenza*, a small town of Piedmont, not far from Asti.

POLLEX, in anatomy, denotes either the thumb or great toe, according as *manus* or *pedis* is added to it.

POLLICHIA, in botany: A genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking with those that are doubtful. Of this there is only one species, *viz.* the *campestris*, or whorl-leaved pollichia, a native of the Cape of Good Hope, and flowers in September.

POLLICIPES, the TOE-SHELL, in natural history, is the name of a genus of shells, the characters of which are these: they are multivalve flat shells, of a triangular figure, each being composed of several laminæ, which end in a sharp point. They stand upon pedicles, and are furnished with a great number of hairs. We have only one known species of this genus, which is always found in large clusters.

POLLICIS PRESSIO, and POLLICIS VERSIO, were used at the combats of gladiators as signals of life or death to the vanquished combatant; or to the victor to spare or take the life of his antagonist. The *pollicis pressio*, by which the people granted life to the prostrate gladiator, was no more than a clenching of the fingers of both hands together, and so holding the two thumbs upright close together. The *pollicis versio*, which authorised the victor to kill the other as a coward, was the bending back of the thumbs. Such is Dacier's opinion; but others say the *pollicis pressio* was when the people held up one hand with the thumb bent, and the *pollicis versio* when they showed the hand with the thumb raised. Authors, however, are not perfectly agreed, though the phrases *pollicem premere*, and *pollicemvertere*, frequently occur in the Latin classics as indications of the people's will that a gladiator should live or die.

POLLIO (Caius Asinius), a celebrated Latin poet and orator, was of consular dignity, and composed some tragedies which were esteemed, but are now lost. He was the first who opened at Rome a library for the use of the public. He was the friend of Mark Antony; which prevented his complying with the solicitations of Augustus, who pressed him to embrace his party. At length Augustus having wrote some verses against Pollio, he was urged to answer them: on which he said, "I shall take care of writing against a man who has the power of proscribing us." He is praised by Virgil and Horace, whose patron he was.

There was another *Pollio*, a friend of Augustus, who used to feed his fishes with human flesh. This cruelty was discovered when one of his servants broke a glass in the presence of Augustus, who had been invited to a feast. The master ordered the servant to be seized, but he threw himself at the feet of the emperor, and begged him to interfere, and not to suffer him to be devoured by fishes. Upon this the causes of his apprehension

Pollution
Pollux.

were examined; and Augustus, astonished at the barbarity of his favourite, caused the servant to be dismissed, all the fish ponds to be filled up, and the crystal glasses of Pollio to be broken to pieces.

POLLUTION, in general, signifies defilement, or the rendering a person or place unclean or unholy. For the Jewish pollutions, see the article IMPURITY.

The Romanists hold a church to be polluted by the effusion of blood or of seed therein: and that it must be consecrated anew. And the Indians are so superstitious on this head, that they break all the vessels which those of another religion have drank out of, or even only touched; and drain all the water out of a pond in which a stranger has bathed.

POLLUTION, in medicine, a disease which consists in an involuntary emission of the seed in time of sleep. This, in different persons, is very different in degree; some being affected with it only once in a week, a fortnight, three weeks, or a month, and others being subject to it almost every night. The persons most subject to it, are young men of a sanguineous temperament, who feed high and lead a sedentary life. When this happens to a person but once in a fortnight or a month, it is of no great consequence; but when it happens almost every night, it greatly injures the health; the patient looks pale and sickly; in some the eyes become weak and inflamed, are sometimes affected with violent desquations, and are usually at last encircled with a livid appearance of the skin. This distemper is to be cured rather by a change of life than by medicines. When it has taken its rise from a high diet and a sedentary life, a coarser food and the use of exercise will generally cure it. Persons subject to this disease should never take any stimulating purges, and must avoid as much as possible all violent passions of the mind: and though exercise is recommended in moderation, yet if this be too violent, it will rather increase the disorder than contribute to its cure.

Self-POLLUTION. See ONANISM.

POLLUX (Julius), a Greek writer of antiquity, flourished in the reign of the emperor Commodus, and was born at Naucrates, a town in Egypt. He was educated under the sophists, and made great progress in grammatical and critical learning. He taught rhetoric at Athens, and became so famous that he was made preceptor of the emperor Commodus. He drew up for his use, and inscribed to him, while his father Marcus Antoninus was living, an *Onomasticon* or Greek Vocabulary, divided into ten books. It is extant, and contains a vast variety of synonymous words and phrases, agreeably to the copiousness of the Greek tongue, ranged under the general classes of things. It was intended to facilitate the knowledge of the Greek language to the young prince; and it is still very useful to all who have a mind to be perfect in it. The first edition of it was printed at Venice by Aldus in 1502, and a Latin version was afterwards made and published with it: but there was no correct and handsome edition of it till that of Amsterdam, 1706, in folio, by Lederlinus and Hemsterhusius. Lederlinus went through the first seven books, correcting the text and version, and subjoining his own, with the notes of Salmasius, If. Vossius, Valesius, and of Kuhnus, whose scholar he had been, and whom he succeeded in the professorship of the oriental languages in the university of Strasburg.

VOL. XV.

Hemsterhusius continued the same method through the three last books: this learned man has since distinguished himself by an excellent edition of Lucian, and other monuments of solid and profound literature.

POLLUX wrote many other things, none of which remain. He lived to the age of 58. Philostratus and Lucian have treated him with much contempt and ridicule. *Philostrat. de vit. Sophist.* lib. ii. and *Lucian in Rhetorum præceptorem.*

POLLUX. See CASTOR and POLLUX.

POLLUX, in astronomy, a fixed star of the second magnitude in the constellation Gemini, or the Twins. See CASTOR.

POLLUX and Castor, a fiery meteor. See CASTOR and Pollux.

POŁOCSKI, a palatinate in the duchy of Lithuania, bounded on the north by the palatinate of Weytepski, on the south by the Dwina, on the north by Muscovy, and on the west by Livonia. It is a desert country full of wood, and had formerly its own dukes.

POŁOCSKI, a town of Lithuania, and capital of a palatinate of the same name, with two castles to defend it. It was taken by the Muscovites in 1563, and retaken the same year. It is seated on the river Dwina, 50 miles south-west of Weytepski, and 80 east of Braslaw. E. Long. 29. 0. N. Lat. 56. 4.

POLTROON, or POLTRON, a coward or dastard, wanting courage to perform any thing great or noble. The word is borrowed from the French, who according to Salmasius, derive it *a pollice truncato*; because anciently those who would avoid going to the wars cut off their thumb. But Menage, with more probability, derives it from the Italian *paltrone*, and that from *poliro* a "bed;" because timorous, pusillanimous people take pleasure in lying a-bed. Others choose to derive the word from the Italian *poltro* a "colt;" because of that creature's readiness to run away.

POLVERINE, the calcined ashes of a plant; of a similar nature with our pot-ashes or pearl-ashes. It is brought from the Levant and Syria; and in the glass-trade it is always to be preferred to any other ashes. The barilla, or pot-ashes of Spain, yield more pure salt than the pulverine of the Levant, but the glass made with it has always some blue tinge; that made with the pulverine is perfectly white, which ought always to be used for the finest crystal.

POLYADELPHIA (from *πολυς* many, and *αδελφια* brotherhood), many brotherhoods. The name of the 18th class of Linnæus's sexual system, consisting of plants with hermaphrodite flowers, in which several stamina or male organs are united by their filaments into three or more distinct bundles.

POLYÆNUS, the name of many famous men recorded in ancient writers. Among them was Julius Polyænus, of whom we have some Greek epigrams extant in the first book of the *Anthologia*. The Polyænus whom it most concerns us to know about, is the author of the eight books of the *Stratagems of illustrious Commanders in War*. He was probably a Macedonian, and perhaps a soldier in the early part of his life; but of this there is no certainty. He was undoubtedly a rhetorician and a pleader of causes; and appears, from the dedication of his work to the emperors Antoninus and Verus, to have lived towards the latter part of the second century. The *Stratagemata* were published

Pollux.
||
Polyænus.

Polyandria in Greek by Isaac Casaubon, with notes, in 1589, 12mo; but no good edition of them appeared till that of Leyden, 1690, in 8vo. The title-page runs thus: *Polyæni Stratagematum libri octo, Justo Vulteio interprete, Pancratius Maasvicius recensuit, Isaaci Casauboni nec non suis notas adjecit.*

||
Polybius.

We have in this work the various stratagems of above 300 captains and generals of armies, chiefly Greeks and barbarians: for the Romans seldom used such finesses; and Polyænus has shown further, that he was not well versed in Roman affairs. A great number of these stratagems appear to us to be ridiculous or impracticable; and neither the generals, nor even common foldiers of our days, would be found simple enough to be caught by them. Few of this order are capable of reading *Polyænus's Stratagems*; and if they were, they would reap little benefit from it. The book is useful to such as study the Greek language and antiquity; for many things will be found in it, illustrating the customs and opinions of ancient times. The sixth and seventh books are imperfect.

Polyænus composed other works besides the *Stratagemata*. Stobæus has produced some passages out of a book *De Republica Macedonum*; and Suidas mentions a piece concerning the Thebans and three books of Tacitus. If death had not prevented, he would have written *Memorabilia of the Emperors Antoninus and Verus*: for he makes a promise of this in the preface to his sixth book of *Stratagems*. Casaubon, in the dedication of Polyænus to Mornæus, calls him *an elegant, acute, and learned writer*.

POLYANDRIA (from πολυς *many*, and ἀνὴρ *a man* or *husband*), many husbands. The name of the 13th class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, which are furnished with several stamina, that are inserted into the common receptacle of the flower.

POLYANTHEA, a collection of common-places in alphabetical order, for the use of orators, preachers, &c. The word is formed from the Greek πολυς *much*, and ἄνθος *flower*; and has much the same meaning with *anthology* or *florilege*. The first author of the polyanthea was Dominic Nanni de Mirabellio, whose labour has been improved on by Barth. Amantius, and Franc. Torfius; and since these, by Jos. Langius, under the title of *Polyanthea nova*, 1613.

POLYANTHUS, in botany. See PRIMULA.

POLYBIUS, a famous Greek historian, was born at Megalopolis, a city of Arcadia, 205 years before Christ; and was the son of Lycortas, chief of the republic of the Achæans. He was trained to arms under the celebrated Philopœmen, and is described by Plutarch carrying the urn of that great but unfortunate general in his funeral procession. He arose to considerable honours in his own country, but was compelled to visit Rome with other principal Achæans, who were detained there as pledges for the submission of their state. From hence he became intimate with the second Scipio Africanus, and was present with him at the demolition of Carthage. He saw Corinth also plundered by Mummius, and thence passing through the cities of Achaia, reconciled them to Rome. He extended his travels into Egypt, France, and Spain, that he might avoid such geographical errors as he has censured in others.

It was in Rome that he composed his excellent his-

tory, for the sake of which his travels were undertaken. This history was divided into 40 books; but there only remains the five first, with extracts of some parts of the others. It has had several editions in Greek and Latin; and there is an English translation by Mr Hampton. He died at the age of 82.

Polycarp.

POLYCARP, one of the most ancient fathers of the Christian church, was born towards the end of the reign of Nero, probably at Smyrna; where he was educated at the expence of Calista, a noble matron distinguished by her piety and charity. He was unquestionably a disciple of St John the Evangelist, and conversed familiarly with other of the apostles. When of a proper age, Bucolus ordained him a deacon and catechist of his church; and upon his death he succeeded him in the bishopric, to which he is said to have been consecrated by St John, who also directed his Apocalypse, among others, to him, under the title of *the angel of the church of Smyrna*. At length the controversy about the observation of Easter beginning to grow high between the eastern and western churches, he went to Rome to discourse with those who were of the opposite party. The see was then possessed by Anicetus, with whom he had many conferences, that were carried on in the most peaceable and amicable manner; and though neither of them could bring the other to embrace his opinion, they both retained their own sentiments without violating that charity which is the great law of their religion.

Whilst at Rome he particularly opposed the heresies of Marcian and Valentinus. His conduct on this occasion is related by Irenæus; who informs us, that when Polycarp passed Marcian in the street without speaking, Marcian said, "Polycarp, own us!" To which he replied with indignation, "I own thee to be the first-born of Satan." Irenæus adds, that when any heretical doctrines were spoken in his presence, he would stop his ears and say, "Good God! to what times hast thou reserved me, that I should hear such things!" and immediately left the place. He was wont to tell, that St John, going into a bath at Ephesus, and finding Cerinthus the heretic in it, immediately started back without bathing, crying out, "Let us run away, lest the bath should fall upon us while Cerinthus the enemy of truth is in it." Polycarp governed the church of Smyrna with apostolic purity, till he suffered martyrdom in the 7th year of Marcus Aurelius; the manner of which is thus related.

The persecution waxing hot at Smyrna, and many having sealed their faith with their blood, the general cry was, "Away with the impious; let Polycarp be sought for." Upon which he privately withdrew into a neighbouring village, where he continued for some time praying night and day for the peace of the church. He was thus employed, when one night he fell into a trance, and dreamed that his pillow took fire, and was burnt to ashes; which, when he awoke, he told his friends was a presage that he should be burnt alive for the cause of Christ. Three days afterwards, in order to escape the incessant search for him, he retired into another village: his enemies, however, were at hand, who seized upon two youths (one of whom they forced by stripes to a confession), by whom they were conducted to his lodging. He might have saved himself by getting into another house; but he submitted, saying, "The will of the Lord be done." He therefore came down.

Polycarp. down from his bed-chamber, and saluting his persecutors with a serene and cheerful countenance, he ordered a table to be set with provisions, invited them to partake of them, and only requested for himself one hour for prayer; after which he was set upon an ass, and conducted towards Smyrna. On the road he met Herod an irenarch or justice of the province, and his father, who were the principal instigators of the persecution. Herod took him up into his chariot, and strenuously endeavoured to undermine his constancy; but having failed in the attempt, he thrust him out of the chariot with so much violence and indignation, that he bruised his thigh with the fall. When at the place of execution, there came, as is said, a voice from heaven, saying, "Polycarp, be strong, and quit thyself like a man." Before the tribunal he was urged to swear by the genius of Caesar. "Repent (says the proconsul), and say with us, take away the impious." Whereupon the martyr looking round at the crowd with a severe and angry countenance, beckoned with his hand, and looking up to heaven, said with a sigh, in a very different tone from what they meant, "Take away the impious." At last, confessing himself to be a Christian, the crier thrice proclaimed his confession, and the people shouted, "This is the great doctor of Asia, and the father of the Christians; this is the destroyer of our gods, that teaches men not to do sacrifice, or worship the deities." When the fire was prepared, Polycarp requested not to be nailed, as usual, but only tied to the stake; and after a short prayer, which he pronounced with a clear and audible voice, the executioner blew up the fire, which increasing to a mighty flame, "Behold a wonder seen (says my author) by us who were purposely reserved, that we might declare it to others; the flames disposing themselves, into the resemblance of an arch, like the sails of a ship swelled with the wind, gently encircled the body of the martyr, who stood all the while in the midst, not like roasted flesh, but like the gold or silver purified in the furnace, his body sending forth a delightful fragrant, which, like frankincense or some other costly spices, presented itself to our senses. The infidels, exasperated by the miracle, commanded a spearman to run him through with a sword: which he had no sooner done, but such a vast quantity of blood flowed from the wound as extinguished the fire; when a dove was seen to fly from the wound, which some suppose to have been his soul, clothed in a visible shape at the time of its departure (A)." The Christians endeavoured to carry off his body entire, but were not allowed by the irenarch, who commanded it to be burnt to ashes. The bones, however, were gathered up, and decently interred by the Christians.

Thus died St Polycarp, the 7th of the kalends of May, A. C. 167. The amphitheatre on which he suffered was mostly remaining not many years ago; and his tomb, which is in a little chapel in the side of a

mountain, on the south-east of the city, was solemnly visited by the Greeks on his festival day; and for the maintenance and repairing of it, travellers were wont to throw a few asses into an earthen pot that stands there for the purpose. He wrote some homilies and epistles, which are now lost, except that to the Philippians, which is a truly pious and Christian piece, containing short and useful precepts and rules of life, which St Jerome informs us was even in his time read in the public assemblies of the Asiatic churches. It is singularly useful in proving the authenticity of the books of the New Testament; for he has several passages and expressions from Matthew, Luke, the Acts, St Paul's Epistles to the Philippians, Ephesians, Galatians, Corinthians, Romans, Thessalonians, Colossians, 1st Timothy, 1st Epistle of St John, and 1st of Peter; and makes particular mention of St Paul's Epistle to the Ephesians. Indeed his whole Epistle consists of phrases and sentiments taken from the New Testament (B).

POLYCARPON, in botany: A genus of the trigynia order, belonging to the triandria class of plants; and in the natural method ranking under the 22d order, *Caryophyllei*. The calyx is pentaphyllous; there are five very small ovate petals; the capsule is unilocular and trivalved.

POLYCHREST, in pharmacy, signifies a medicine that serves for many uses, or that cures many diseases.

Sal POLYCHREST, a compound salt made of equal parts of saltpetre and sulphur, deflagrated in a red-hot crucible.

POLYCNUM, in botany: A genus of the monogynia order, belonging to the triandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. The calyx is triphyllous; and there are five calciform petals, with one seed almost naked.

POLYCRATES, was a tyrant of Samos, famous for the good fortune which always attended him. He became very powerful; and got possession not only of the neighbouring islands, but also of some cities on the coast of Asia. He had a fleet of 100 ships of war and was so universally esteemed, that Amasis the king of Egypt made a treaty of alliance with him. The Egyptian king was, however, afraid of his continued prosperity, and advised him to chequer his enjoyments, by relinquishing some of his most favourite objects. Polycrates, in compliance, threw into the sea a beautiful seal, the most valuable of his jewels. The loss of so precious a seal afflicted him for some time; but soon after he received as a present a large fish, in whose belly it was found. Amasis no sooner heard this, than he gave up all alliance with the tyrant of Samos, and observed, that sooner or later his good fortune would vanish. Some time after Polycrates visited Magnesia on the Mæander, where he had been invited by Orontes the governor. Here he was shamefully put to death, merely because the governor wished to terminate his prosperity. The

(A) The miraculous part of this account is ridiculed by Dr Middleton in his *Free Enquiry and Defence* of it; but something is offered in its favour by Mr Jortin, who observes, "the circumstances are sufficient only to create a pause and a doubt." *Remarks on Eccl. Hist.* vol. i.

(B) Jortin, vol. i. p. 68. who to the particulars made out by Cotelierius, has added one from Galat. iv. 26. and another from Hebr. iv. 12, 13.

Polyerota daughter of Polycrates had dissuaded her father from going to the house of Orontes, on account of the bad dreams which she had, but in vain.

Polygala

POLYCROTA, in the naval architecture of the ancients, is a word used to express such of their galleys as had three, four, five, or more tiers of rowers, seated at different heights; they were distinguished by this term from the *monocrota*, or those which had only single rows of oars. The number of rows of rowers in the *polycrota* galleys has given occasion to some to suppose those vessels of such a height from the water as is scarce credible. Commentators are not at all agreed upon the construction of these vessels.

POLYDAMAS, was a famous athlete, who imitated Hercules in whatever he did. He killed a lion with his fist, and it is reported he could stop a chariot with his hand in its most rapid course. He was one day with some of his friends in a cave, when on a sudden a large piece of rock came tumbling down, and while all fled away he attempted to receive the falling fragment in his arms. His prodigious strength, however, was insufficient, and he was instantly crushed to pieces under the rock.

POLYDECTES, a son of Magnes, was king of the island of Seriphos. He received with great kindness Danae and her son Perseus, who had been exposed on the sea by Acrisius. He took great care of the education of Perseus; but becoming enamoured of Danae, he removed her from his kingdom, apprehensive of his resentment. He afterwards paid his addresses to Danae; and being rejected, he prepared to offer her violence. Danae fled to the altar of Minerva for protection; and Dictys, the brother of Polydectes, who had himself saved her from the sea-waters, opposed her ravisher, and armed himself in her defence. At this critical moment Perseus arrived; and with Medusa's head he turned into stones Polydectes, with the associates of his guilt. The crown of Seriphos was given to Dictys, who had shown himself so active in the cause of innocence.

POLYDORE VIRGIL. See VIRGIL.

POLYDORUS, a son of Priam by Hecuba, or, according to others, by Laothoe, the daughter of Altes, king of Pedasus. Being young and inexperienced when Troy was besieged by the Greeks, his father removed him to the court of Polymnestor, king of Thrace, to whose care he entrusted the greatest part of his treasures, till his country should be freed from foreign invasion. On the death of Priam, Polymnestor made himself master of the riches which were in his possession; and to ensure them the better, he murdered the young prince, and threw his body into the sea, where it was found by Hecuba. According to Virgil, his body was buried near the shore by his assassin; and there grew on his grave a myrtle, whose boughs dropped blood, when Æneas going to Italy, attempted to tear them from the tree.

POLYGALA, MILKWORT: A genus of the octandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 33d order, *Lomentacea*. The calyx is pentaphyllous, with two of its leaflets wing-shaped and coloured; the legumen is obcordate and bilocular. There are 24 species; of which the most remarkable are,

1. The vulgaris, or common milkwort, is a native of the British heaths and dry pastures. The stalks are

about five or six inches long, several arising from the same root: the leaves are firm, smooth, entire, and grow alternate upon the stalks, which are terminated with spikes of flowers, most commonly blue, but often red or white: the calyx consists of five leaves, three of which are small and green, two below, and one above the corolla; the other two intermediate ones are large, oval, flat-coloured, veined, and resemble petals, which at length turn greenish, and remain a defence to the seed-vessel; the corolla consists of three petals folded together, and forming a tube: the carina is terminated by a kind of heart-shaped, concave appendage, fringed at the extremity. The root of this plant has a bitter taste, and has been found to possess the virtues of the American rattlesnake-root. It purges without danger, and is also emetic and diuretic; sometimes operating all the three ways at once. A spoonful of the decoction made by boiling an ounce of the herb in a pint of water till one half has exhaled, has been found serviceable in pleurifies and fevers, by promoting a diaphoresis and expectoration; and three spoonfuls of the same, taken once an hour, has proved beneficial in the dropsy and anasarca. It has also been found serviceable in consumptive complaints.

2. The *senega*, or *seneka*, rattlesnake-wort, grows naturally in most parts of North America. This hath a perennial root composed of several fleshy fibres, from which arise three or four branching stalks which grow erect, garnished with spear-shaped leaves placed alternately. The flowers are produced in loose spikes at the end of the branches: they are small, white, and shaped like those of the common sort. It flowers in July, but the plants do not produce seeds. The root of this species operates more powerfully than the last; but besides the virtues of a purgative, emetic, and diuretic, it has been recommended as an antidote against the poison of a rattlesnake; but this opinion is now exploded. It still, however, maintains its character in several disorders. Its efficacy, particularly in pleurifies, is most fully established in Virginia: formerly near 50 out of 100 died of that distemper, but by the happy use of this root hardly three out of the same number have been lost.

As the seeds of the rattlesnake-wort seldom succeed even in the countries where the plant is a native, the best method of propagating it in Europe is to procure the roots from America, and plant them in a bed of light earth in a sheltered situation, where they will thrive without any other culture than keeping them free from weeds. But though the plant will stand out ordinary winters, it will be proper to cover it during that season with old tanner's bark, or other mulch, to keep out the frost.

POLYGAMIA (*πολυς* many, and *γαμος* marriage). This term, expressing an intercommunication of sexes, is applied, by Linnaeus, both to plants and flowers. A polygamous plant is that which bears both hermaphrodite flowers and male or female, or both.

POLYGAMY, a plurality of wives or husbands, in the possession of one man or woman at the same time.

Polygamy is so universally esteemed unlawful, and even unnatural, through Europe, and in all Christian countries, that we have generally reasoned upon this conviction. Both religion and reason appear at first sight at least to condemn it; and with this view of the subject

Polygala
Polygamy

Polygamy. subject mankind in general rest satisfied : but some bolder geniuses have taken the opposite side of the question ; have cast off the prejudices of education, and attempted to show that polygamy is not unlawful, but that it is just and necessary, and would be a public benefit. Such writers, to use the words of an intelligent critic *, “ recur to the common subterfuge, of which every *feiter up of strange gods*, and every CONSCIENTIOUS troubler of the public peace, have artfully availed themselves to silence the clamour of expostulation. ‘ TRUTH ! TRUTH ! ’ is their general cry : and with this hopeful pretence, prudence and humility, and every amiable and useful virtue ; are left behind ; while CONSCIENCE (*conscience !*) blindly rushes forward to oppose order, insult authority, and overturn the customs of ages.”

But notwithstanding these fair pretences, it will, we doubt not, be easy to show that truth is not upon their side ; prudence and delicacy are certainly at open war with them : for Dr Percival, Phil. Trans. vol. lxvi. part i. p. 163. has very justly observed, that the practice is brutal, destructive to friendship and moral sentiment, inconsistent with one great end of marriage, the education of children, and subversive of the natural rights of more than half of the species. Besides, it is injurious to population, and therefore can never be countenanced or allowed in a well-regulated state ; for though the number of females in the world may considerably exceed the number of males, yet there are more men capable of propagating their species than women capable of bearing children ; and it is a well-known fact, that Armenia, in which a plurality of wives is not allowed, abounds more with inhabitants than any other province of the Turkish empire.

Indeed it appears, that in some countries where it is allowed, the inhabitants do not take advantage of it. “ The Europeans (says M. Niebuhr †) are mistaken in thinking the state of marriage so different among the Mussulmans from what it is with Christian nations. I could not discern any such difference in Arabia. The women of that country seem to be as free and as happy as those of Europe can possibly be. Polygamy is permitted, indeed, among Mahometans, and the delicacy of our ladies is shocked at this idea ; but the Arabians rarely avail ‡ themselves of the privilege of marrying four lawful wives, and entertaining at the same time any number of female slaves. None but rich voluptuaries marry so many wives, and their conduct is blamed by all sober men. Men of sense, indeed, think this privilege rather troublesome than convenient. A husband is by law obliged to treat his wives suitably to their condition, and to dispense his favours among them with perfect equality : but these are duties not a little disagreeable to most Mussulmans ; and such modes of luxury are too expensive to the Arabians, who are seldom in easy circumstances. I must, however, except one case ; for it sometimes happens that a man marries a number of wives in the way of commercial speculation. I know a Mullah, in a town near the Euphrates, who had married four wives, and was supported by the profits of their labour.”

See a curious kind of polygamy under the article NAYRES. The ancient Britons, too, had a kind of polygamy among them, 12 women being common to 12 men.

Selden has proved, in his *Uxor Hebraica*, that plura-

lity of wives was allowed of, not only among the Hebrews, but also among all other nations, and in all ages. It is true, the ancient Romans were more severe in their morals, and never practised it, though it was not forbid among them : and Mark Antony is mentioned as the first who took the liberty of having two wives.

From that time it became pretty frequent in the empire till the reigns of Theodosius, Honorius, and Arcadius, who first prohibited it by express law in 393. After this the emperor Valentinian, by an edict, permitted all the subjects of the empire if they pleased, to marry several wives ; nor does it appear, from the ecclesiastical history of those times, that the bishops made any opposition to this introduction of polygamy. In effect, there are some even among the Christian casuists who do not look on polygamy as in itself criminal. Jurieu observes, that the prohibition of polygamy is a positive law ; but from which a man may be exempted by sovereign necessity. Baillet adds, that the example of the patriarchs is a very powerful argument in favour of polygamy : of these arguments we shall speak hereafter.

It has been much disputed among the doctors of the civil law whether polygamy be adultery. In the Roman law it is called *stuprum*, and punished as such, that is, in some cases, capitally. But a smaller punishment is more consistent with the Jewish law, wherein the prohibition of adultery is perpetual, but that of polygamy temporary only.

In Germany, Holland, and Spain, this offence is differently punished. By a constitution of Charles V. it was a capital crime. By the laws of ancient and modern Sweden it is punished with death. In Scotland it is punished as perjury.

In England it is enacted by statute 1 Jac. I. cap. 11. that if any person, being married, do afterwards marry again, the former husband or wife being alive, it is felony, but within the benefit of clergy. The first wife in this case shall not be admitted as an evidence against her husband, because she is the true wife ; but the second may, for she is indeed no wife at all ; and so *vice versa* of a second husband. This act makes an exception to five cases, in which such second marriage, tho’ in the three first it is void, is, however, no felony. 1. Where either party hath been continually abroad for seven years, whether the party in England had notice of the other’s being living or not. 2. Where either of the parties hath been absent from the other seven years within the kingdom, and the remaining party hath had no notice of the other’s being alive within that time. 3. Where there is a divorce or separation *a mensa et thora* by sentence in the ecclesiastical court. 4. Where the first marriage is declared absolutely void by any such sentence, and the parties loosed *a vinculo*. Or, 5. Where either of the parties was under the age of consent at the time of the first marriage ; for in such case the first marriage was voidable by the disagreement of either party, which this second marriage very clearly amounts to. But if at the age of consent the parties had agreed to the marriage which completes the contract, and is indeed the real marriage, and afterwards one of them should marry again, judge Blackstone apprehends that such second marriage would be within the reason and penalties of the act.

Bernardus Ochinus, general of the order of Capuchins, and afterwards a Protestant, published, about the middle

* Monthly Review, vol. 63, p. 274.

Polygamy. middle of the 16th century, Dialogues in favour of Polygamy, which were answered by Theodore Beza. And about the conclusion of the last century we had at London an artful treatise published in behalf of a plurality of wives, under the title of *Polygamia Triumphatrix*: the author whereof assumes the name of *Theophilus Aleibeus*; but his true name was *Lyferus*. He was a native of Saxony. It has been answered by several.

A new argument in favour of polygamy has been adduced by Mr Bruce, on this principle, that in some parts of the world the proportion of female children is much greater than that of males. "From a diligent inquiry (says he) into the south and scripture-part of Mesopotamia, Armenia, and Syria, from Mouful or Nineveh to Aleppo and Antioch, I find the proportion to be fully two women to one man. There is indeed a fraction over, but it is not a considerable one. From Latikea, Laodicea *ad mare*, down the coast of Syria to Sidon, the number is nearly three, or two and three fourths, to one man. Through the Holy Land, the country called *Horan*, in the Isthmus of Suez, and the parts of the Delta unfrequented by strangers, it is something less than three. But from Suez to the Straits of Babelmandel, which contains the three Arabias, the proportion is fully four women to one man; which I have reason to believe holds as far as the line, and 30° beyond it. The Imam of Sama was not an old man when I was in Arabia Felix in 1769; but he had 88 children then alive, of whom 14 only were sons. The priest of the Nile had 70 and odd children; of whom, as I remember, above 50 were daughters.

"It may be objected, that Dr Arbuthnot, in quoting the bills of mortality for 20 years, gave the most unexceptionable grounds for his opinion; and that my single assertion of what happens in a foreign country, without further foundation, cannot be admitted as equivalent testimony: and I am ready to admit this objection, as there are no bills of mortality in any of these countries. I shall therefore say in what manner I attained the knowledge which I have just mentioned. Whenever I went into a town, village, or inhabited place, dwelt long in a mountain, or travelled journeys with any set of people, I always made it my business to inquire how many children they had, or their fathers, their next neighbours or acquaintance. I then asked my landlord at Sidon, suppose him a weaver, how many children he has had? He tells me how many sons and how many daughters. The next I ask is a tailor, a smith, &c. in short every man who is not a stranger, from whom I can get the proper information. I say, therefore, that a medium of both sexes, arising from three or four hundred families, indiscriminately taken, shall be the proportion in which one differs from the other; and this, I am confident, will give the result to be three women in 50° of the 90° under every meridian of the globe."

Our author corroborates this argument by supposing that Mahomet perceived this disproportion, and that upon it he founded his institution allowing one man to have four wives. "With this view he enacted, or rather revived, the law which gave liberty to every individual to marry four wives, each of whom was to be equal in rank and honour, without any preference but what the predilection of the husband gave her."

Having thus established, as he supposes, the necessity

of polygamy in the East, Mr Bruce proceeds to consider Polygamy. whether there is not some other reasons why it should not be practised in Britain farther than the mere equality in numbers of the sexes to one another. This reason he finds in the difference between the constitutions of the Europeans and eastern nations. "Women in England (says he) are capable of child-bearing at 14; let the other term be 48, when they bear no more; 34 years therefore an English woman bears children. At the age of 14 or 15 they are objects of our love; they are endeared by bearing us children after that time; and none, I hope, will pretend, that at 48 and 50 an Englishwoman is not an agreeable companion. The Arab, on the other hand, if she begins to bear children at 11, seldom or never has a child after 20. The time, then, of her child-bearing is nine years; and four women, taken altogether, have then the term of 36. So that the English woman that bears children for 34 years has only two years less than the term enjoyed by the four wives whom Mahomet has allowed; and if it be granted that an English wife may bear at 50, the terms are equal. But there are other grievous differences. An Arabian girl, at 11 years old, by her youth and beauty, is the object of man's desire: being an infant, however, in understanding, she is not a rational companion for him. A man marries there, say at 20; and before he is 30, his wife, improved as a companion, ceases to be an object of his desires and a mother of children: so that all the best and most vigorous of his days are spent with a woman he cannot love; with her he would be destined to live 40, or 45 years, without comfort to himself by increase of family, or utility to the public. The reasons, then, against polygamy, which subsist in England, do not by any means subsist in Arabia; and that being the case, it would be unworthy of the wisdom of God, and an unevenness in his ways, which we shall never see, to subject two nations under such different circumstances absolutely to the same observances."

To all this argumentation, however, it may be replied, that whatever we may now suppose to be the constitution of nature in the warmer parts of the globe, it certainly was different at the beginning. We cannot indeed ascertain the exact position of the Garden of Eden; but it is with reason supposed not to have been far from the ancient seat of Babylon. In that country, therefore, where Mr Bruce contends that four women are necessary to the comfort of one man, it pleased God to grant only one to the first man; and that, too, when there was more occasion for population than ever there has been since, because the whole earth was to be peopled from a single pair. Matters were not altered at the flood; for Noah had but one wife. And this is the very argument used by our Saviour himself when speaking of divorce without any sufficient cause, and then marrying another woman, which is a species of polygamy.—Again, with respect to the alleged multiplicity of females in the eastern part of the world, it is by no means probable that the calculations of Mr Bruce or any other person can be admitted in this case. History mentions no such thing in any nation; and considering the vast destruction among the male part of the human species more than of the females by war and other accidents, we may safely say, that if four women children were born for every single male, there would

Polygamy. in such countries be five or six grown up women for every man; a proportion which we may venture to affirm does not, nor ever did, exist anywhere in the world. That it was not so in former times we can only judge from the particular examples recorded in history, and these are but few. We read in the Greek history, indeed, of the *fifty* daughters of Danaus; but these were matched by as many *sons* of another man. Job had only one wife, yet had *seven* sons and but *three* daughters. Jacob had two wives, who bore *twelve* sons, and only one daughter. Abraham had only one child by his first wife, and that was a son. By his second wife Keturah he had six sons; and considering his advanced age at the time he married her, it is by no means probable that he could have 24 daughters; nay, if, as Mr Bruce tells us, the women in the eastern countries bear children only for nine years, it was impossible she could have so many. Gideon, who had many wives, had no fewer than seventy sons by these wives, and even his concubine had a son; so that if all these women had produced according to Mr Bruce's proportion, of nearly three females to one male, he must have had almost 284 children; a better family than any of Mr Bruce's eastern acquaintances can probably boast of.

With regard to this subject, however, it must be observed, that the procreation of male or female children depends in some degree on the health and vigour of the parents. It is by no means improbable, therefore, that the eastern voluptuaries, whose constitutions are debilitated by their excesses, may have many more female than male children born to them. The women themselves, by premature enjoyment, will also be inclined to produce females instead of males; but neither of these circumstances can prove this to be an original law of nature. Something like this may be gathered from sacred history. Gideon abovementioned, who was a hardy and active warrior, had many sons. The same was the case with David, who led an active and laborious life; while Solomon, who was a voluptuary, had only one son, notwithstanding his multitude of wives.

The most barefaced defence of polygamy that has appeared in modern times is by the Rev. Mr Madan, who published a treatise, artfully vindicating, and strongly recommending it, under the title of *Tbelyphthora*; or, *A treatise on Female Ruin, in its Causes, Effects, Consequences, Prevention, and Remedy*, &c. Marriage, according to this writer, simply and wholly consists in the act of personal union, or *actus coitus*. Adultery, he says, is never used in the sacred writings but to denote the defilement of a betrothed or married woman, and to this sense he restricts the use of the term; so that a married man, in his opinion, is no adulterer, if his commerce with the sex be confined to single women, who are under no obligations by espousals or marriage to other men: but, on the other hand, the woman who should dare to have even but once an intrigue with any other man besides her husband, (let him have as many wives as Solomon), would, *ipso facto*, be an adulteress, and ought, together with her gallant, to be punished with immediate death. This, he boldly says, is the law of God: and on this foundation he limits the privilege of polygamy to the man; in support of which he refers to the polyga-

mous connections of the patriarchs and saints of the Polygamy Old Testament, and infers the lawfulness of their practice from the blessings which attended it, and the laws which were instituted to regulate and superintend it. He contends for the lawfulness of Christians having, like the ancient Jews, more wives than one; and labours much to reconcile the genius of the evangelical dispensation to an arrangement of this sort. With this view he asserts, that there is not one text in the New Testament that even hints at the criminality of a polygamous connection; and he would infer from St Paul's direction, that bishops and deacons should have but one wife, that it was lawful for laymen to have more. Christ, he says, was not the giver of a new law; but the business of marriage, polygamy, &c. had been settled before his appearance in the world, by an authority which could not be revoked. Besides, this writer not only thinks polygamy lawful in a religious, but advantageous in a civil, light, and highly politic in a domestic view.

In defence of his notion of marriage, which, he says, consists in the union of man and woman as one body, the effects of which in the sight of God no outward forms or ceremonies of man's invention can add to or detract from, he grounds his principal argument on the Hebrew words made use of in Gen. ii. 24. to express the primitive institution of marriage. viz. *וָאֵחָד בָּשָׂר*, rendered by the LXX. *προσκολληθήσεται πρὸς τὴν γυναῖκα αὐτὴν*, which translation is adopted by the evangelist (Mat. xix. 5.) with the omission only of the superfluous preposition (*πρὸς*) after the verb. Our translation, "shall cleave to his wife," doth not, he says, convey the idea of the Hebrew, which is literally, as Montanus renders the words, "shall be joined or cemented *in* his woman, and they shall become (*i. e.* by this union) one flesh." But on this criticism it is well remarked, that both the Hebrew and Greek terms mean simply and literally attachment or adherence; and are evidently made use of in the sacred writings to express the whole scope of conjugal fidelity and duty though he would restrain them to the grosser part of it.

With respect to the Mosaic law, for which Mr Madan is a warm advocate, it was certainly a local and temporary institution, adapted to the ends for which it was appointed, and admirably calculated, in its relation to marriage, to maintain and perpetuate the separation of the Jewish people from the Gentiles. In attempting to depreciate the outward forms of marriage, this writer would make his readers believe, that because none are explicitly described, therefore none existed; and consequently that they are the superfluous ordinances of human policy. But it is evident, from comparing Ruth iv. 10. 13. with Tobit vii. 13. 14. and from the case of Dinah, related Gen. xxxiv. that some forms were deemed essential to an honourable alliance by the patriarchs and saints under the Old Testament, exclusive of the carnal knowledge of each other's persons. It is also evident in the case of the woman of Samaria, whose connection with a man not her husband is mentioned in John iv. that something besides cohabitation is necessary to constitute marriage in the sight of God.

Having stated his notion of marriage, he urges, in defence of polygamy, that, notwithstanding the seventh commandment, it was allowed by God himself,

where,

Polygamy, who made laws for the regulation of it, wrought miracles in support of it by making the barren women fruitful, and declared the issue legitimate to all intents and purposes. God's allowance of polygamy is argued from Exod. xxi. 10, and particularly from Deut. xxi. 15, which, he says, amounts to a demonstration. This passage, however, at the utmost, only presupposes that the practice might have existence among so hard-hearted and fickle a people as the Jews; and therefore wisely provides against some of its more unjust and pernicious consequences, such as tended to affect the rights and privileges of heirship. Laws enacted to regulate it cannot be fairly urged in proof of its lawfulness on the author's own hypothesis; because laws were also made to regulate divorce, which Mr Madan condemns as absolutely unlawful, except in cases of adultery. Besides, it is more probable that the "hated wife" had been dismissed by a bill of divorcement, than that she was retained by her husband: and moreover, it is not certain but that the two wives, so far from living with the same husband at the same time, might be dead; for the words may be rendered thus, "if there *should have been* to a man two wives, &c." The words expressing the original institution of marriage, Gen. ii. 24, compared with Mat. xix. 4, 5, 8, afford insuperable objections against Mr Madan's doctrine of polygamy.

If we appeal on this subject, from the authority of Scripture to the writings of the earliest fathers in the Christian church, there is not to be found the faintest trace of any thing resembling a testimony to the lawfulness of polygamy; on the contrary, many passages occur, in which the practice of it is strongly and explicitly condemned.

We shall close this article with the words of an excellent anonymous writer already quoted, and to whose critique on Mr Madan's work we are indebted for the above remarks: "In a word, when we reflect that the primitive institution of marriage limited it to one man and one woman; that this institution was adhered to by Noah and his sons, amidst the degeneracy of the age in which they lived, and in spite of the examples of polygamy which the accursed race of Cain had introduced; when we consider how very few (comparatively speaking) the examples of this practice were among the faithful; how much it brought its own punishment with it; and how dubious and equivocal those passages are in which it appears to have the sanction of divine approbation; when to these reflections we add another, respecting the limited views and temporary nature of the more ancient dispensations and institutions of religion—how often the imperfections and even vices of the patriarchs and people of God, in old time, are recorded, without any express notification of their criminality—how much is said to be commanded, which our reverence for the holiness of God and his law will only suffer us to suppose, were, for wise ends, permitted—how frequently the messengers of God adapted themselves to the genius of the people to whom they were sent, and the circumstances of the times in which they lived:—above all, when we consider the purity, equity, and benevolence of the Christian law; the explicit declaration of our Lord, and his apostle St Paul, respecting the institution of marriage its design and limita-

Polygamy tion;—when we reflect, too, on the testimony of the most ancient fathers, who could not possibly be ignorant of the general and common practice of the apostolic church; and, finally, when to these considerations we add those which are founded on justice to the female sex, and all the regulations of domestic economy and national policy—we must wholly condemn the revival of polygamy; and thus bear our honest testimony against the leading design of this dangerous and ill-advised publication."

We would advise our readers to read the whole criticisms on Madan's book in the *Monthly Review*, together with their account of the several answers to it. The reverend author of the *Thelyphthora* has there met with a most able antagonist, who traces him through all his deceitful windings, and exposes the futility and falsehood of his arguments with singular ability. See *Monthly Review*, vol. lxiii. p. 273, &c.; see also *Paley's Moral Philosophy*, 4to. p. 262.

POLYGARS, are natives of Hindostan. They inhabit almost impenetrable woods, and are under the absolute direction of their own chieftains. In time of peace they are professionally robbers, but in times of war are the guardians of the country. The general name of these people is *Polygar*. Their original institution, for they live in distinct clans, is not very well understood. It probably took its rise from the municipal regulations relative to the destruction of tigers and other ferocious beasts. Certain tracts of woodland were indisputably allotted as rewards to those who should slay a certain number of those animals; and those lands approximating, probably laid the foundation of the several confederacies of Polygars.

"The Pollams, or woods, from which is derived the word *Polygar*, lying in profusion through all the southern parts of Hindostan, the ravages committed in the open countries by these adventurous clans, are both frequent and destructive. Cattle and grain are the constant booty of the Polygars. They not unfrequently even despoil travellers of their property, and sometimes murder, if they meet with opposition: yet these very Polygars are the hands into which the aged and infirm, the wives, children, and treasure, of both Hindoos and others are entrusted, when the circumjacent country unfortunately happens to be the seat of war. The protection they afford is paid for; but the price is inconsiderable, when the helpless situation of those who fly to them for shelter is considered, and especially when their own very peculiar character is properly attended to. The native governments of Hindostan are under the necessity of tolerating this honourable banditti. Many of them are so formidable as to be able to bring 15,000 and 20,000 men into the field.

"The Hindoo code of laws, in speaking of robberies, hath this remarkable clause, 'The mode of shares amongst robbers shall be this:—If any thief or thieves, by the command of the magistrate, and with his assistance, have committed depredations upon, and brought away any booty from, another province, the magistrate shall receive a share of one sixth part of the whole. If they received no command or assistance from the magistrate, they shall give the magistrate in that case one tenth part for his share, and of the remainder their chief shall receive four shares; and whosoever among

Polygars
||
Polygno-
tus.

among them is perfect master of his occupation, shall receive three shares: also, which ever of them is remarkably strong and stout, shall receive two shares, and the rest shall receive each one share.' Here, then, we see not only a sanction, but even an inducement, to fraudulent practices.—Another singular inconsistency among a people who, in many periods of their history, have been proverbial for innocency of manners, and for uncommon honesty in their conduct towards travellers and strangers.

"At the first sight, it would appear that the toleration of the Polygars, owing to their great numbers, and to the security of their fortresses, which are in general impenetrable but to Polygars; that the government licence, in this manner given to them, to live on the spoils of the industrious—might have originally occasioned the formal division, and encouragement to perseverance, which we have just quoted: but the cause I should rather suppose to lie in the nature of certain governments, than to have arisen from any accidental circumstance afterwards; and I am the more inclined to this opinion, from the situation of the northern parts of Hindostan, which are, and always have been, uninfested by these freebooters.

"The dominion of the East was, in former days, most probably divided and subdivided into all the various branches of the feudal system. The vestiges of it remain to this hour: rajahs and zemindars are nothing more than chieftains of a certain degree of consequence in the empire. If, then, experience has shown, in other parts of the world, that clans have always been observed to commit the most pernicious acts of depredation and hostility on each other, and that the paramount lord has seldom been able effectually to crush so general and so complicated a scene of mischief—may we not reasonably venture to suppose, that the Hindoo legislature passed this ordinance for the suppression of such provincial warfare, and for the wholesome purpose of drawing the people, by unalarming degrees, more immediately under the controul of the one sovereign authority? The conclusion, I own, appears to me satisfactory. Moreover, Polygars cannot but be of modern growth; for the law relative to thefts is antecedent to the mention of Polygars in history." Sullivan's *Philosophical Rhapsodies*.

POLYGLOTT, among divines and critics, chiefly denotes a Bible printed in several languages. See BIBLE AND PRINTING.

POLYGLOTTUS, in ornithology. See TURDUS.

POLYGNOTUS, a famous painter of Thafos, flourished about 422 years before the Christian era, and was the son and scholar of Aglaophon. He adorned one of the public porticoes of Athens with his paintings, in which he had represented the most striking events of the Trojan war. The Athenians were so pleased with him, that they offered to reward his labours with whatever he pleased to accept; but he declined the offer; and the Amphictyonic council, which was composed of the representatives of the principal cities of Greece, ordered that Polygnotus should be maintained at the public expence wherever he went.

Of the talents of Polygnotus much honourable mention is made by many of the best authors of antiquity, as Aristotle and Plutarch, Dionysius Halicarnassensis,

VOL. XV.

&c. Pausanias speaks of his pictures of the events of the Trojan war, and, in his Tenth Book, introduces a very long description of other pictures by the same artist, painted also from Homer in the temple at Delphos. The passage, however, gives but a confused and imperfect idea of the painter's performance. How much the art is indebted to this ancient master, what grace and softness he gave to the human countenance, what embellishments he added to the female figure and dress, are much more happily described by Pliny. "Primus mulieres lucida veste pinxit, capita earum mitris versicoloribus operuit, plurimumque picturæ primus contulit: siquidem instituit os adaperire, dentes ostendere, vultum ab antiquo rigore variare."—The same author likewise bears honourable testimony to the liberal spirit of this great artist, who refused any reward for his ingenious labours in the portico.—"Porticum gratuito, cum partem ejus Mycon mercede pingeret." Plin. lib. 35. cap. 8.

POLYGON, in geometry, a figure with many sides, or whose perimeter consists of more than four sides at least; such are the pentagon, hexagon, heptagon, &c.

POLYGONUM, KNOT-GRASS: A genus of the trigynia order, belonging to the octandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. There is no calyx; the corolla is quinquepartite, and calycine, or serving instead of a calyx; there is one angulated seed. There are 27 species; but the most remarkable are, 1. The bistorta, bistort, or greater snakeweed, hath a thick oblique intorted root, blackish without, and red within; a simple, round, slender stem, near two feet high; oval leaves, having decurrent foot-stalks, and the stalk terminated by thick short spikes of whitish-red flowers. 2. The viviparum, or smaller bistort, hath a thickish root, a simple slender stem half a foot high, spear-shaped leaves, and the stalks and branches terminated by long spikes of whitish-red flowers. Both these perennials flower in May and June, succeeded by ripe seeds in August. They grow wild in England, &c. the first in moist, the other in mountainous, situations. 3. Oriental polygonum, commonly called *persicaria*, hath fibrous roots; an upright, robust, strong, jointed stem, rising eight or ten feet high, dividing at top into several branches; very large oval-lanceolate alternate leaves, on broad footstalks half surrounding the stem; and all the branches terminated by long, slender, hanging spikes of reddish-purple heptandrous and digynious flowers, from July till October. 4. Eragrostis, buckwheat, or brank, rises with an upright, smooth, branchy stem, from about a foot and a half to a yard high, heart-shaped sagittated leaves, and the branches terminated by clusters of whitish flowers, succeeded by large angular seeds; excellent for feeding pigeons and most sorts of poultry.

All these plants are hardy, and succeed in almost any soil and situation; the two first are perennial in root; and the third and fourth are annual, wholly decay at the end of summer, or early in winter. The first two sorts are retained in some curious gardens for variety; but their chief merit is for medical purposes; they are powerful astringents, and are used both internally and externally; esteemed very efficacious in hæmorrhagies and other fluxes; and good to heal sore mouths. The third sort, Oriental polygonum, or *persicaria*, is a most

T t

elegant

Polygon,
Polygo-
num.

Polyglo-
num
||
Polyhe-
dron.

elegant annual for the embellishment of pleasure-ground; assuming a majestic tree-like growth by its erect luxuriant stem, and branchy head; which being garnished with noble large foliage, and numerous pendulous spikes of flowers, in constant succession three or four months, exhibits a very ornamental appearance from June or July until October, and is so easy of culture, that from its scattered seeds in autumn, young plants rise spontaneously in abundance the ensuing spring, and shoot up so rapidly as to attain six or eight feet in height by July, when they generally begin flowering, and continue till attacked by the frost, when they totally perish; so that a fresh supply must be raised from seed annually. The fourth sort (buck-wheat) is a sort of corn, and is frequently cultivated both by way of fodder, cutting its stalks while young and green to feed cattle, and for its grain to feed pigeons, poultry, hogs, &c. It flourishes in any soil and situation, but generally thrives best in a light dry earth; and the driest seasons seldom retard its growth. The first and second sorts are easily propagated in plenty, by parting the roots in autumn. The third sort, Oriental polygonum, being annual is always propagated from seed annually, either in the full ground, or by means of hot-beds.

Uses. The root of a kind of bistort, according to Gmelin, is used in Siberia for ordinary food. This species is by Haller called *bistorta foliis ad oram nervosis*, and by some other botanists *bistorta montana minor*. The natives call it *mouka*; and so indolent are they, that, to save themselves the trouble of digging it out of the earth, they go in spring and pillage the holes of the mountain rats, which they find filled with these roots. In Britain, bistort is used as a medicine. All the parts of bistort, have a rough austere taste, particularly the root, which is one of the strongest of the vegetable astringents. It is employed in all kinds of immoderate hæmorrhagies and other fluxes, both internally and externally, where astringency is the only indication. It is certainly a very powerful styptic, and is to be looked on simply as such; the sudorific, antipestifential, and other like virtues ascribed to it, it has no other claim to than in consequence of its astringency, and of the antiseptic power which it has in common with other vegetable styptics. The largest dose of the root in powder is a single dram.

POLYGRAPHY, **POLYGRAPHIA**, or *Polygraphice*, the art of writing in various unusual manners or ciphers; as also of deciphering the same. The word is formed from the Greek, *πολυ multum*, and *γραφη scriptura*, "writing."

The ancients seem to have been very little acquainted with this art; nor is there any mark of their having gone beyond the Lacedæmonian scytala. Trithemius, Porta, Vigenère, and father Nicéron, have written on the subject of polygraphy or ciphers. See **CIPHER**.

POLYHYMNIA, in the pagan mythology, one of the nine muses, thus named from the Greek words *πολυς* "much," and *ὑμνος* "song." She presided over history, or rather rhetoric; and is represented with a crown of pearls and a white robe; her right hand in action as if haranguing, and holding in her left a caduceus or sceptre to show her power.

POLYHEDRON, in geometry, denotes a body or solid comprehended under many sides or planes.

POLYHEDRON, in optics, is a multiplying glass or

lens, consisting of several plane surfaces disposed into a convex form. See **OPTICS**, n° 256.

POLYMATHY, denotes the knowledge of many arts and sciences. The word is derived from the Greek, *πολυ multum*, and *μαθασθαι, disco*.

||
Polyph-
mus.

POLYMNESTOR, was a king of the Thracian Chersonesus. He married Ilione, Priam's eldest daughter; and for the sake of the treasure with which he was entrusted by Priam during the siege of Troy, he murdered Polydorus, (see **POLYDORUS**). The fleet in which the victorious Greeks returned, together with their Trojan captives, among whom was Hecuba, stopped on the coasts of Thrace, where one of the female captives discovered on the shore the body of Polydorus, whom Polymnestor had thrown into the sea. The dreadful intelligence was immediately communicated to Hecuba his mother, who recollecting the frightful dreams she had the preceding night, did not doubt but Polymnestor was the cruel assassin. Resolved to revenge her son's death, she immediately called out Polymnestor, as if to impart to him something of importance. He was drawn into the snare; and no sooner was he introduced into the apartment of the Trojan princess, than the female captives rushing upon him, put out his eyes with their pins, while Hecuba murdered his two children, who had accompanied him. Euripides informs us, that the Greeks condemned Polymnestor to be banished into a distant island for his perfidy. Hyginus, however, relates the whole differently, and tells us, that when Polydorus was sent to Thrace, Ilione his sister took him instead of her son Deiphilus, who was of the same age, being fearful of her husband's cruelty. The monarch, unacquainted with the imposition, looked upon Polydorus as his own son, and treated Deiphilus as her brother. After the destruction of Troy, the conquerors wished the house and family of Priam to be extirpated, and therefore offered Electra the daughter of Agamemnon to Polymnestor, if he would destroy Ilione and Polydorus. He accepted the offer, and immediately dispatched his own son Deiphilus, whom he took for Polydorus. Polydorus, who passed as the son of Polymnestor, consulted the oracle after the murder of Deiphilus, and being informed that his father was dead, his mother a captive in the hands of the Greeks, and his country in ruins, he communicated the answer to Ilione, whom he had always regarded as his mother. She told him the measures she had pursued to save his life, upon which he avenged the perfidy of Polymnestor by putting out his eyes.

POLYMNIA, in botany: A genus of the polygamia necessaria order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is paleaceous; there is no pappus; the exterior calyx is tetraphyllous, or pentaphyllous; the interior decaphyllous, and composed of concave leaflets.

POLYNICES, the son of Œdipus by his mother Jocasta. See **JOCASTA**, **ŒDIPUS**, and **ETEOCLES**.

POLYPE. See **POLYPUS**.

POLYPETALOUS, among botanists, an epithet applied to such flowers as consist of several petals or flower-leaves.

POLYPHEMUS (fab hist.), a celebrated Cyclops, and king of all the Cyclops in Sicily, was the son of Neptune and Thoosa the daughter of Phorcys. He is said to have been a monster of great strength, very tall, and

Polypodium.

and with one eye in the middle of the forehead. He eat human flesh, and kept his flocks on the coast of Sicily, when Ulysses, at his return from the Trojan war, was driven there. Ulysses, together with 12 of his companions, visited the coast, and with them was seized by the Cyclops, who confined them in his cave, and daily devoured two of them. Ulysses would have shared the fate of the rest, had he not intoxicated the Cyclops, and put out his eye with a firebrand when he was asleep. Polyphemus was awakened by the sudden pain, and stopped the entrance of his cave; but Ulysses escaped, by creeping between the legs of the rams of the Cyclops, as they were led out to feed on the mountains. Polyphemus became enamoured of Galatæa; but his addresses were disregarded, and the nymph shunned his presence. The Cyclops was still more earnest; and when he saw Galatæa surrender herself to the pleasures of Acis, he crushed his rival with a piece of a broken rock.

POLYPODIUM, in botany; a genus of the order of filices, belonging to the cryptogamia class of plants. The fructifications are in roundish points, scattered over the inferior disc of the frons or leaf.—There are 65 species, of which the most remarkable is the filix mas, or common male fern. This grows in great plenty throughout Britain in woods and stony uncultivated soils. The greatest part of the root lies horizontally, and has a great number of appendages placed close to each other in a vertical direction, while a number of small fibres strike downwards. The leaves are a cubit high, and grow in circular tufts. They are at first alternately pinnate, the pinnæ increasing in size from the base towards the middle, and afterwards gradually decreasing upwards to the summit of the leaf. These pinnæ are again pinnatifid, or subdivided almost to the nerve into obtuse parallel lobes, crenated on the edges. The stalks are covered with brown filmy scales. The fructifications are kidney-shaped, and covered with a permanent scaly shield or involucre. The capsules are of a pale brown, surrounded with a saffron-coloured elastic ring.

This fern has nearly the same qualities, and is used for most of the same intentions, as the pteris aquilina. They are both burnt together for the sake of their ashes, which are purchased by the soap and glass-makers. In the island of Jura are exported annually 150 l. worth of these ashes.

Gunner relates, in his *Flor. Novæ*, that the young curled leaves, at their first appearance out of the ground, are by some boiled and eaten like asparagus; and that the poorer Norwegians cut off those succulent laminæ, like the nails of the finger at the crown of the root, which are the bases of the future stalks, and brew them into beer, adding thereto a third portion of malt, and in times of great scarcity mix the same in their bread. The same author adds, that this fern cut green, and dried in the open air, affords not only an excellent litter for cattle, but, if infused in hot water, becomes no contemptible fodder to goats, sheep, and other cattle, which will readily eat and sometimes grow fat upon it: a circumstance well worth the attention of the inhabitants of the Highlands and Hebrides, as great numbers of their cattle, in hard winters, frequently perish for want of food.

But the anthelmintic quality of the root of the male fern is that for which it is chiefly to be valued, and of

which an account is given under the article **MEDICINE**, p. 343. col. 2.

The polypodium oreopteris is only remarkable because it has been confounded by most of the English botanists with the species which we have now described, and the polypodium thelypteris. It has a large scaly root, wrapped and tied together with small strong fibres, not to be separated without difficulty.—The fructifications are on the margins both when young and old, and never run into one another: the lobes are oval and plain. It is four times as large as the thelypteris, and grows in dry woods, moors or hills, and very seldom near water; all which characters are widely different from those of the species with which it has been confounded. It is to be found both in England and Scotland, in the latter place very plentifully. See *Linnaean Transactions*, vol. 1. p. 181.

POLYPREMUM, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 22d order, *Caryophyllæi*. The calyx is tetraphyllous; the corolla quadrifid and rotaceous, with its lobes obcordate; the capsule compressed, emarginated, and bilocular.

POLYPUS, a species of fresh-water insects, belonging to the genus of hydra, of the order of zoophytes, and class of vermes. (See **ANIMALCULE**, n° 24, &c.) The name of *hydra* was given them by Linnæus on account of the property they have of reproducing themselves when cut in pieces, every part soon becoming a perfect animal. Dr Hill called them *biota*, on account of the strong principle of life with which every part of them is endowed.

These animals were first discovered by Leeuwenhoek, who gave some account of them in the Philosophical Transactions for 1703, but their wonderful properties were not thoroughly known till the year 1740, when Mr Trembley began to investigate them. Previous to his discoveries, indeed, Leibnitz and Boerhaave, by reasonings *à priori*, had concluded that animals might be found which would propagate by slips like plants; and their conjectures were soon verified by the observations of the gentlemen above-mentioned. At first, however, Mr Trembley was uncertain whether he should reckon these creatures animals or plants; and while thus uncertain, he wrote a letter on the subject to Mr Bonnet in January 1741; but in March the same year he had satisfied himself that they were real animals. The surprise of Mr Trembley, and of others, on discovering the true nature of these animals, was very great. When Mr Reaumur saw for the first time two polypes formed from one which he had divided into two parts, he could hardly believe his own eyes; and even after having repeated the operation an hundred times, he said that the sight was by no means familiar to him. On the 18th of July 1741, M. Buffon wrote to Martin Folkes, Esq; president of the Royal Society, acquainting him with “the discovery of a small insect called a *polypus*, which is found about the common duck-weed; and which, being cut in two, puts forth from the upper part a tail, and from the lower end a head, so as to become two animals instead of one. If it be cut into three parts, the middlemost also puts out from one end a head, and from the other a tail, so as to become three distinct animals, all living like the first, and performing the various offices of their

Polypremum,
Polypus.

Polypus. species."—In September the same year, a letter was communicated from C. Bentink, Esq; at the Hague, describing the insects discovered by Mr Trembley, adding, that he himself had seen them; and in November that year, a letter was read before the Society from Gronovius, at Leyden, giving an account of a water-insect, which, says he, if cut into five or six pieces, in a few hours there will be as many animals exactly similar to their parent. These accounts, however, were all deemed so extraordinary, that they were not credited, until professors Albinus and Muschenbroeck provided themselves with them, and found every thing related concerning them to be exactly true. In March 1742, Mr Folkes gave an account of them to the Royal Society, from some observations made on several polypes which Mr Trembley had sent from Holland. They were soon after found in England, and the observations made upon them were published by several persons; so that no doubt remained concerning the reality of what had been related concerning them.

The general character of the polype is, that it fixes itself by its base; is gelatinous, linear, naked, contractile; and can change its place. The mouth, which is placed at one end, is surrounded by hair-like feelers. The young ones grow out from its sides; but in autumn it produces eggs from its sides. There are six varieties.

1. The *viridis*, or green polype, has commonly ten short arms.

2. The *fusca* has frequently eight arms several times longer than the body.

3. The *grisea* is of a yellowish colour, small towards the bottom, and has long arms, generally about seven in number.

4. The *pallens* has generally about six arms of a moderate length.

5. The *hydatula* has a vesicular body, and four obsolete arms. It is found in the abdomen of sheep, swine, &c.

6. The *stentorea* has been called the *tunnel-shaped*, and has a mouth surrounded with a row of hairs.

7. The *socialis* is bearded, thick, and wrinkled.

The three first species are those on which the greatest number of experiments have been made; and their shapes are so various, that it is by no means easy to describe them. They are generally found in ditches. Whoever has carefully examined these when the sun is very powerful, will find many little transparent lumps of the appearance of a jelly, and size of a pea, and flattened upon one side. The same kind of substances are likewise to be met with on the under side of the leaves of plants which grow in such places. These are the polypes in a quiescent state, and apparently inanimate. They are generally fixed by one end to some solid substance, with a large opening, which is the mouth, at the other; having several arms fixed round it, projecting as rays from the centre. They are slender, pellucid, and formed of a tender substance like the horns of a snail, and capable of contracting themselves into a very small compass, or of extending to a considerable length. The arms are capable of the same contraction and expansion as the body; and with these they lay hold of minute worms and other insects, bringing them to the mouth and swallowing them; the indigestible parts are again thrown out by the mouth.

The green polype was that first discovered by Mr Trembley; and the first appearances of spontaneous motion were perceived in its arms, which it can contract, extend, and twist about in various directions. On the first appearance of danger they contract to such a degree that they appear little bigger than a grain of sand, of a fine green colour, the arms disappearing entirely. Soon after he found the *grisea*, and afterwards the *fusca*.

The bodies of the *viridis* and *grisea* diminish almost insensibly from the anterior to the posterior extremity; but the *fusca* is for the most part of an equal size for two-thirds of its length from the anterior to the posterior extremity, from which it becomes abruptly smaller, and then continues of a regular size to the end. These three kinds have at least six, and at most 12 or 13 arms, though sometimes the *grisea* is met with having 18 arms. They can contract themselves till their bodies do not exceed one-tenth of an inch in length, and they can stop at any intermediate degree of contraction or extension. They are of various sizes, from half an inch to an inch and an half long; their arms are seldom longer than their bodies, though some have them an inch, and some even eight inches, long. The thickness of their bodies decreases as they extend themselves, and *vice versa*; and they may be made to contract themselves either by agitating the water in which they are contained, or by touching the animals themselves. When taken out of the water, they all contract so much that they appear only like a little lump of jelly. The arms have the same power of contraction or expansion that the body has; and they can contract or expand one arm, or any number of arms, independent of the rest; and they can likewise bend their bodies or arms in all possible directions. They can also dilate or contract their bodies in various places, and sometimes appear thick set with folds, which, when carelessly viewed, appear like rings. Their progressive motion is performed by that power which they have of contracting and dilating their bodies. When about to move, they bend down their head and arms, lay hold by means of them on some other substance to which they design to fasten themselves; then they loosen their tail, and draw it towards the head; then either fix it in that place, or stretching forward their head as before, repeat the same operation. They ascend or descend at pleasure in this manner upon aquatic plants, or upon the sides of the vessel in which they are kept; they sometimes hang by the tail from the surface of the water, or sometimes by one of the arms; and they can walk with ease upon the surface of the water. On examining the tail with a microscope, a small part of it will be found to be dry above the surface of the water, and as it were in a little concave space, of which the tail forms the bottom; so that it seems to be suspended on the surface of the water on the same principle that a small pin or needle is made to swim. When a polype, therefore, means to pass from the sides of the glass to the surface of the water, it has only to put that part out of the water by which it is to be supported, and to give it time to dry, which it always does upon these occasions; and they attach themselves so firmly by the tail to aquatic plants, stones, &c. that they cannot be easily disengaged: they often further strengthen these attachments by

means

Polypus.

Polypus. means of one or two of their arms, which serve as a kind of anchors for fixing them to the adjacent substances.

The stomach of the polype is a kind of bag or gut into which the mouth opens, and goes from the head to the tail. This, in a strong light, is visible to the naked eye, especially if the animal be placed between the eye and a candle; for these animals are quite transparent whatever their colour may be. The stomach, however, appears to more advantage through a powerful magnifier. Mr Trembley, by cutting one of these animals transversely into three parts, satisfied himself that they were perforated throughout. Each piece immediately contracted itself, and the perforation was very visible through a microscope. The skin which incloses the stomach is that of the polype itself; so that the whole animal, properly speaking, consists only of one skin, in the form of a tube, and open at both ends. No vessels of any kind are to be distinguished.

The mouth is situated at the anterior end in the middle between the shooting forth of the arms, and assumes different appearances according to circumstances; being sometimes lengthened out in the form of a nipple, at others appearing truncated; sometimes the aperture is quite closed, at others there is a hollow; though at all times a small aperture may be discovered by a powerful magnifier.

The skin of a polype, when examined with a microscope, appears like shagreen, or as if covered with little grains, more or less separated from each other, according to the degree of contraction of the body. If the lips of a polype be cut transversely, and placed so that the cut part of the skin may lie directly before the microscope, the skin throughout its whole thickness will be found to consist of an infinite number of grains, and the interior part is found to be more shagreened than the exterior one; but they are not strongly united to each other, and may be separated without much trouble. They even separate of themselves, though in no great numbers, in the most healthy animals of this kind; for where they are observed to separate in large quantities, it is a symptom of a very dangerous disorder. In the progress of this disorder, the surface of the polype becomes gradually more and more rough and unequal, and no longer well defined or terminated as before. The grains fall off on all sides; the body and arms contract and dilate, and assume a white shining colour; and at last the whole dissolves into an heap of grains, which is more particularly observed in the green polype. By a careful examination we find, that the skin of the polype is entirely composed of grains, cemented by means of a kind of gummy substance; but it is to the grains entirely that the polype owes its colour. The structure of the arms is analogous to that of the body; and they appear shagreened when examined by the microscope, whether they be in a state of contraction or extension; but if very much contracted, they appear more shagreened than the body, though almost quite smooth when in their utmost state of extension. In the green polype the appearance of the arm is continually varying; and these variations are more sensible towards the extremity of the arm than at its origin, but more scattered in the parts further on. The extremity is often terminated by a knob, the hairs of which cannot be observed without a very powerful mag-

nifier. They have a remarkable inclination of turning towards the light; so that if that part of the glass on which they are be turned from the light, they will quickly remove to the other.

That species named the *fusca* has the longest arms, and makes use of the most curious manœuvres to seize its prey. They are best viewed in a glass seven or eight inches deep, when their arms commonly hang down to the bottom. When this, or any other kind, is hungry, it spreads its arms in a kind of circle to a considerable extent, inclosing in this, as in a net, every insect which has the misfortune to come within the circumference. (See ANIMALCULE, n° 27.). While the animal is contracted by seizing its prey, the arms are observed to swell like the muscles of the human body when in action. Though no appearance of eyes can be observed in the polype, they certainly have some knowledge of the approach of their prey, and show the greatest attention to it as soon as it comes near them. It seizes a worm the moment it is touched by one of the arms; and in conveying it to the mouth, it frequently twists the arm into a spiral like a cork-screw; by which means the insect is brought to the mouth in a much shorter time than otherwise it would be; and so soon are the insects on which the polypes feed killed by them, that M. Fontana thinks they must contain the most powerful kind of poison; for the lips scarce touch the animal when it expires, though there cannot be any wound perceived on it when dead. The worm, when swallowed, appears sometimes single, sometimes double, according to circumstances. When full, the polype contracts itself, hangs down as in a kind of stupor, but extends again in proportion as the food is digested and the excrementitious part is discharged. The bodies of the insects, when swallowed, are first macerated in the stomach, then reduced into fragments, and driven backward and forward from one end of the stomach to the other, and even into the arms, however fine they may be; whence it appears that the arms, as well as the other parts of this remarkable creature, are a kind of hollow guts or stomachs. In order to observe this motion, it is best to feed the polypes with such food as will give a lively colour; such, for instance, as those worms which are furnished with a red juice. Some bits of a small black snail being given to a polype, the substance of the skin was soon dissolved into a pulp consisting of small black fragments; and on examining the polype with a microscope, it was found that the particles were driven about in the stomach, and that they passed into the arms, from thence back into the stomach, then to the tail; from whence they passed again into the arms, and so on. The grains of which the body of the polype consist take their colour from the food with which it is nourished, and become red or black as the food happens to afford the one colour or the other. They are likewise more or less tinged with these colours in proportion to the strength of the nutritive juices; and it is observable that they lose their colour if fed with aliments of a colour different from themselves. They feed on most insects found in fresh water; and will also be supported with worms, the larvæ of gnats, &c. and even with snails, large aquatic insects, and fish or flesh, if cut into small bits. Sometimes two polypes lay hold of the same worm, and each begins

Polypus.

Polypus. begins to swallow its own end till their mouths meet and the worm breaks. But should this happen not to be the case, the one polype will sometimes devour the other along with its portion. It appears, however, that the stomach of one polype is not fitted for dissolving the substance of another; for the one which is swallowed always gets clear again after being imprisoned for an hour or two.

The manner in which the polypes generate is most perceptible in the grisea and fusca, as being considerably larger than the viridis. If we examine one of them in summer, when the animals are most active, and prepared for propagation, some small tubercles will be found proceeding from its sides, which constantly increase in bulk, until at last in two or three days they assume the figure of small polypes. When they first begin to shoot, the excrescence becomes pointed, assuming a conical figure, and deeper colour than the rest of the body. In a short time it becomes truncated, and then cylindrical, after which the arms begin to shoot from the anterior end. The tail adheres to the body of the parent-animal, but gradually grows smaller, until at last it adheres only by a point, and is then ready to be separated. When this is the case, both the mother and young ones fix themselves to the sides of the glass, and are separated from each other by a sudden jerk. The time requisite for the formation of the young ones is very different, according to the warmth of the weather and the nature of the food eaten by the mother. Sometimes they are fully formed, and ready to drop off, in 24 hours; in other cases, when the weather is cold, 15 days have been requisite for bringing them to perfection.

It is remarkable, that there is a reciprocal communication of food betwixt the young and old before they be separated. The young ones, as soon as they are furnished with arms, catch prey for themselves, and communicate the digested food to the old ones, who on the other hand do the same to the young ones. This was fully verified by the following experiment: One of the large polypes of the *fusca* kind being placed on a slip of paper in a little water, the middle of the body of a young one growing out from it was cut open; when the superior part of that end which remained fixed to the parent was found to be open also. By cutting over the parent polype on each side of the shoot, a short cylinder was obtained, open at both ends; which being viewed through a microscope, the light was observed to come through the young one into the stomach of the old one. On cutting open the cylindrical portion lengthwise, not only the hole of communication was observed, but one might see through the end of the young one also. On changing the situation of the two pieces, the light was seen through the hole of communication.

This may be seen between the parent polype and its young ones after feeding them; for, after the parents have eaten, the bodies of the young ones swell as if they themselves had been eating.

The polypes produce young ones indiscriminately from all parts of their bodies, and five or six young ones have frequently been produced at once; nay, Mr Trembley has observed nine or ten produced at the same time.

Nothing like copulation among these creatures was ever observed by Mr Trembley, though for two years he had thousands of them under his inspection. To be

more certain on this subject, he took two young ones the moment they came from their parent, and placed them in separate glasses. Both of them multiplied, not only themselves, but also their offspring, which were separated and watched in the same manner to the seventh generation; they have even the same power of generation while adhering to their parent. In this state the parent, with its children and grandchildren, exhibits a singular appearance, looking like a shrub thick set with branches. Thus several generations sometimes are attached to one another, and all of them to one parent. Mr Adams gives a figure of one polype with *nineteen* young ones hanging at it; the whole group being about an inch broad, and an inch and an half in length; the old polype eat about twelve monoculi per day, and the young ones about 20 among them.

When a polype is cut transversely or longitudinally into two or three parts, each part in a short time becomes a perfect animal; and so great is this prolific power, that a new animal will be produced even from a small portion of the skin of the old one. If the young ones be mutilated while they grow upon the parent, the parts so cut off will be reproduced, and the same property belongs to the parent. A truncated portion will send forth young ones before it has acquired a new head and tail of its own, and sometimes the head of a young one supplies the place of that which should have grown out of the old one. If we slit a polype longitudinally through the head to the middle of the body, we shall have one formed with two heads; and by slitting these again in the same manner we may form one with as many heads as we please.

A still more surprising property of these animals is, that they may be grafted together. If the truncated portions of a polype be placed end to end, and gently pushed together, they will unite into a single one. The two portions are first joined together by a slender neck, which gradually fills up and disappears, the food passing from the one part into the other; and thus we may form polypes not only from portions of the same, but of different animals; we may fix the head of one to the body of another, and the compound animal will grow, eat, and multiply, as if it had never been divided. By pushing the body of one into the mouth of another, so far that their heads may be brought into contact, and kept there for some time, they will at last unite into one animal, only having double the number of arms which it would otherwise have had. The *hydra fusca* may be turned inside out like a glove, at the same time that it continues to live and act as before. The lining of the stomach now forms the outer skin, and the former epidermis constitutes the lining of the stomach. If previous to this operation the polype have young ones attached to it, such as are but newly beginning to vegetate turn themselves inside out, while the larger ones continue to increase in size till they reach beyond the mouth of the parent, and are then separated in the usual manner from the body. When thus turned the polype combines itself in many different ways. The fore part frequently closes and becomes a supernumerary tail. The animal, which was at first straight, now bends itself, so that the two tails resemble the legs of a pair of compasses, which it can open and shut. The old mouth is placed as it were at the joint of the compasses, but loses its power of action; to supply which, a new one is formed

Polypus.

olypus. formed in its neighbourhood; and in a little time there is a new species of hydra formed with several mouths.

The sides of a polype, which has been cut through in a longitudinal direction, begin to roll themselves up, commonly from one of the extremities, with the outside of the skin inwards; but in a little time they unroll themselves, and the two cut edges join together, sometimes beginning at one extremity, and sometimes approaching throughout their whole length. As soon as the edges join, they unite so closely that no scar can be perceived. If a polype be partly turned back, the open part closes, and new mouths are formed in different places. Every portion of a polype is capable of devouring insects almost as soon as it is cut off: and the voracity of the whole genus is astonishing; for Mr Adams observes, that most of the insects on which they feed bear the same proportion to the mouth of a polype that an apple of the size of a man's head bears to his mouth.

The *hydra pallens* is very rarely met with, and is described only by M. Roefel. It is of a pale yellow colour, growing gradually smaller from the bottom; the tail is round or knobbed; the arms are about the length of the body, of a white colour, generally seven in number, and are apparently composed of a chain of globules. The young are brought forth from all parts of its body.

The *hydratula* is mentioned by many medical writers. Dr Tyson, in dissecting an antelope, found several hydratides or films, about the size of a pigeon's egg, filled with water, and of an oval form, fastened to the omentum; and some in the pelvis between the bladder of urine and rectum. He suspected them to be animals for the following reasons: 1. Because they were included in a membrane like a matrix, so loosely, that by opening it with the finger or a knife, the internal bladder, containing the serum or lymph, seemed nowhere to have any connection with it, but would very readily drop out, still retaining its liquor without spilling any. 2. This internal bladder had a neck or white body, more opaque than the rest, and protuberant from it, with an orifice at its extremity; by which, as with a mouth, it exhausted the serum from the external membrane, and so supplied its bladder or stomach. 3. On bringing this neck near the candle, it moved and shortened itself. It is found in the abdomen of sheep, swine, mice, &c. lying between the peritoneum and the intestines.

The *stomorea*, or funnel-like polype, is of three colours, green, blue, and white; but the last is the most common. They do not form clusters, but adhere singly by the tail to whatever comes in their way: the anterior end is wider than the posterior; and, being round, gives the animal somewhat of a funnel form, though the circle is interrupted by a kind of slit or gap. The edge of this gap is surrounded with a great number of little fimbriæ, which by their motions excite a current of water, that forces into the mouth of the animal the small bodies that come within its reach. Mr Trembley says, that he has often seen a great number of animalcules fall into the mouths of these creatures; some of which were let out again at an opening which he could not describe. They can fashion their mouths into several different forms; and they multiply by dividing neither transversely nor longitudinally, but diagonally.

The *socialis* is described by Muller under the title of *vorticella*. They are found in clusters; and when viewed by a microscope, appear like a circle surrounded with crowns or ciliated heads, tied by small thin tails to a common centre, from whence they advance towards the circumference, and then turn like a wheel, occasioning a vortex which brings along with it the food proper for them.

The *anastatica*, or clustering polypes, form a group resembling a cluster, or rather an open flower, supported by a stem, which is fixed by its lower extremity to some of the aquatic plants or extraneous bodies that are found in the water; the upper extremity is formed into eight or nine lateral branches, perfectly similar to each other, which have also subordinate branches, whose collective form much resembles that of a leaf. Every one of these assemblages is composed of one principal branch or nerve, which makes the main stem of the cluster an angle somewhat larger than a right one: the smaller lateral branches proceed from both sides of this nerve, and these are shorter the nearer their origin is to the principal branch. There is a polype at the extremity, and others on both sides of the lateral twigs, but at different distances from their extremities. They are all exceedingly small, and bell-shaped, with a quick motion about the mouth, though it is impossible to discern the cause of it. See ANIMALCULE, n° 24, 26, PULEX, and VORTICELLA.

The several strange properties recorded of this animal, though very surprising, are, however, none of them peculiar to it alone. The Surinam toad is well known to produce its young, not in the ordinary way, but in cells upon its back. Mr Sherwood has very lately discovered the small eels in four paste to be without exception full of living young ones. And as to the most amazing of all its properties, the reproduction of its parts, we know the crab and lobster, if a leg be broken off, always produce a new one: and Monf. Bonnet, Monf. Lyonet, Monf. de Reaumur, and Mr Folkes, have all found, by experiment, that several earth and water worms have the same property, some of them even when cut into thirty pieces. The *urtica marina*, or sea nettle, has been also found to have the same; and the sea star-fish, of which the polype is truly a species, though it had long escaped the searches of the naturalists, was always well known by the fishermen to have it also.

Marine Polypus, is different in form from the freshwater polype already described; but is nourished, increases, and may be propagated, after the same manner; Mr Ellis having often found, in his inquiries, that small pieces cut off from the living parent, in order to view the several parts more accurately, soon gave indications that they contained not only the principles of life, but likewise the faculty of increasing and multiplying into a numerous issue. It has been lately discovered and sufficiently proved by Peyssonel, Ellis, Jussieu, Reaumur, Donati, &c. that many of those substances which had formerly been considered by naturalists as marine vegetable or sea-plants, are in reality animal-productions; and that they are formed by polypes of different shapes and sizes, for their habitation, defence, and propagation. To this class may be referred the corals, corallines, keratophyta, eschara, sponges, and alcyonium: nor is it improbable, that the more compact bodies, known by the

Polypus.

Polypus. the common appellations of *star-stones*, *brain-stones*, *petrified fungi*, and the like, brought from various parts of the East and West Indies, are of the same origin. To this purpose Mr Ellis observes, that the ocean, in all the warmer latitudes near the shore, and wherever it is possible to observe, abound so much with animal life, that no inanimate body can long remain unoccupied by some species. In those regions, ships' bottoms are soon covered with the habitations of thousands of animals: rocks, stones, and every thing lifeless, are covered with them instantly; and even the branches of living vegetables that hang into the water are immediately loaded with the spawn of different animals, shell-fish of various kinds: and shell-fish themselves, when they become impotent and old, are the basis of new colonies of animals, from whose attacks they can no longer defend them-

selves. For a farther account of this system, see CORAL and CORALLINES.

POLYPUS of the Heart. See MEDICINE, n° 97, 98, 274, and 290.

POLYSARCIA, or CORPULENCY. See MEDICINE, n° 335.

POLYSCHIDES, or SEA HUNGER. See FUCUS.

POLYSPERMOUS (from πολυ and σπέρμα *seed*), in botany, is applied to such plants as have more than four seeds succeeding each flower, without any certain order or number.

POLYSYLLABLE, in grammar, a word consisting of more than three syllables; for when a word consists of one, two, or three syllables, it is called a *monosyllable*, a *disyllable*, and *trisyllable*.

POLYSYNDETON. See ORATORY, n° 67.

ton.

P O L Y T H E I S M,

Definition. **T**HE doctrine of a plurality of gods or invisible powers superior to man.

* Sketches of the Hist. of Man.
“That there exist beings, one or many, powerful above the human race, is a proposition (says Lord Kames*) universally admitted as true in all ages and among all nations. I boldly call it *universal*, notwithstanding what is reported of some gross savages; for reports that contradict what is acknowledged to be general among men, require more able vouchers than a few illiterate voyagers. Among many savage tribes, there are no words but for objects of external sense: it is surprising that such people are incapable of expressing their religious perceptions, or any perception of internal sense? The conviction that men have of superior powers, in every country where there are words to express it, is so well vouched, that in fair reasoning it ought to be taken for granted among the few tribes where language is deficient.”

2 Source of religious principles traced
These are judicious observations, of which every man will admit the force who has not some favourite system to build upon the unstable foundation which his Lordship overturns. Taking it for granted, then, that our conviction of superior powers has long been universal, the important question is, From what cause it proceeds? The same ingenious author shows, with great strength of reasoning, that the operations of nature and the government of this world, which to us loudly proclaim the existence of a Deity, are not sufficient to account for the universal belief of superior beings among savage tribes. He is therefore of opinion, that this universality of conviction can spring only from the image of Deity stamped upon the mind of every human being, the ignorant equally with the learned. “Nothing less (he says) is sufficient: and the original perception which we have of Deity must proceed (he thinks) from an internal sense, which may be termed the *sense of Deity*.”

We have elsewhere expressed our opinion of that philosophy which accounts for every phenomenon in human nature, by attributing it to a particular instinct (see INSTINCT); but to this instinct or *sense of Deity*, considered as complete evidence, many objections, more than usually powerful, force themselves upon us. All nations, except the Jews, were once polytheists and idolaters. If therefore his Lordship's hypothesis be ad-

mitted, either the doctrine of polytheism must be true theology, or this instinct or sense is of such a nature as to have at different periods of the world, misled all mankind. All savage tribes are at present polytheists and idolaters; but among savages every instinct appears in greater purity and vigour than among people polished by arts and sciences; and instinct never mistakes its object. The instinct or primary impression of nature, which gives rise to self-love, affection between the sexes, love of progeny, &c. has in all nations, and in every period of time, a precise and determinate object which it inflexibly pursues. How then comes it to pass, that this particular instinct, which if real is surely of as much importance as any other, should have uniformly led those who had no other guide to pursue improper objects, to fall into the grossest errors and the most pernicious practices? To no purpose are we told, that the sense of Deity, like the moral sense, makes no capital figure among savages. There is reason to believe that the feeling or perception, which is called the *moral sense*, is not wholly instinctive; but whether it be or not, a single instance cannot be produced in which it multiplies its objects, or makes even a savage express gratitude to a thousand persons for benefits which his prince alone had power to confer.

For these, and other reasons which might easily be assigned, we cannot help thinking, that the first religious principles must have been derived from a source different as well from internal sense as from the deductions of reason; from a source which the majority of mankind had early forgotten; and which, when it was banished from their minds, left nothing behind to prevent the very first principle of religion from being perverted by various accidents or causes, or, in some extraordinary concurrence of circumstances, from being perhaps entirely obliterated. This source of religion every consistent Theist must believe to be revelation. Reason, it is acknowledged, and we shall afterwards show (see RELIGION), could not have introduced savages to the knowledge of God; and we have just seen, that a *sense* of Deity is an hypothesis clogged with insuperable difficulties. Yet it is undeniable, that all mankind have believed in superior invisible powers: and if reason and instinct be set aside, there remains no other origin of this

3 To revela-
tion.

Theism. this universal belief that primeval revelation, corrupted, indeed, as it passed by oral tradition from father to son, in the course of many generations. It is no slight support to this doctrine, that if there really be a Deity*, it is highly probable, that he would reveal himself to the first men—creatures whom he had formed with faculties to adore and to worship him. To other animals, the knowledge of a Deity is of no importance; to man, it is of the first importance. Were we totally ignorant of a Deity, this world would appear to us a mere chaos. Under the government of a wise and benevolent Deity, chance is excluded; and every event appears to be the result of established laws. Good men submit to whatever happens without repining, knowing that every event is ordered by Divine Providence: they submit with entire resignation; and such resignation is a sovereign balsam for every misfortune or evil in life.

* See Sketches of the Hist. of Man.

4 Which taught pure theism.

Admitting, then, that the knowledge of Deity was originally derived from revelation, and that the first men professed pure theism, it shall be our business in the present article to trace the rise and progress of *polytheism* and *idolatry*; and to ascertain, if we can, the real opinions of the Pagan world concerning that multitude of gods with which they filled heaven, earth, and hell. In this inquiry, though we shall have occasion to appeal to the writings of Moses, we shall attribute to them no other authority than what is due to records of the earliest ages, more ancient and authentic than any others which are now extant.

Whether we believe, with the author of the book of Genesis, that all men have descended from the same progenitors; or adopt the hypothesis of modern theorists, that there have been successive creations of men, and that the *European* derives his origin from one pair, the *Asiatic* from another, the woolly-headed *African* from a third, and the copper-coloured *American* from a fourth—polytheism and idolatry will be seen to have arisen from the same causes, and to have advanced nearly in the same order from one degree of impiety to another. On either supposition, it must be taken for granted, that the original progenitors were instructed by their Creator in the truths of genuine theism: and there is no room to doubt, but that those truths, simple and sublime as they are, would be conveyed pure from father to son as long as the race lived in one family, and were not spread over a large extent of country. If any credit be due to the records of antiquity, the primeval inhabitants of this globe lived to so great an age, that they must have increased to a very large number long before the death of the common parent, who would of course be the bond of union to the whole society, and whose dictates, especially in what related to the origin of his being and the existence of his Creator, would be listened to with the utmost respect by every individual of his numerous progeny.

Many causes, however, would conspire to dissolve this family, after the death of its ancestor, into separate and independent tribes, of which some would be driven by violence, or would voluntarily wander, to a distance from the rest. From this dispersion great changes would take place in the opinions of some of the tribes respecting the object of their religious worship. A single family, or a small tribe banished into a desert wilderness (such as the whole earth must then have been), would

VOL. XV.

find employment for all their time in providing the means of subsistence, and in defending themselves from beasts of prey. In such circumstances they would have little *leisure* for meditation, and, being constantly conversant with objects of sense, they would gradually lose the power of meditating upon the spiritual nature of that Being by whom their ancestors had taught them that all things were created. The first wanderers would no doubt retain in tolerable purity their original notions of Deity; and they would certainly endeavour to impress those notions upon their children: but in circumstances infinitely more favourable to speculation than theirs could have been, the human mind dwells not long upon notions purely intellectual. We are so accustomed to sensible objects, and to the ideas of space extension, and figure, which they are perpetually impressing upon the imagination, that we find it extremely difficult to conceive any being without assigning to him a form and a place. Hence a learned writer* has supposed, that the earliest generations of men (even those to whom he contends that frequent revelations were vouchsafed) may have been no better than *anthropomorphites* in their conceptions of the Divine Being.

Be this as it may, it is not conceivable but that the members of those first colonies would quickly lose many of the arts and much of the science which perhaps prevailed in the parent state; and that fatigued with the contemplation of intellectual objects, they would relieve their overstrained faculties, by attributing to the Deity a place of abode, if not a human form. To men totally illiterate, the place fittest for the habitation of the Deity would undoubtedly appear to be the sun, the most beautiful and glorious object of which they could form any idea; an object, too, from which they could not but be sensible that they received the benefits of light and heat, and which experience must soon have taught them to be in a great measure the source of vegetation. The great spirit therefore inhabiting the sun, which they would consider as the power of light and heat, was in all probability the first object of idolatrous adoration.

From looking upon the sun as the habitation of their God, they would soon proceed to consider it as his body. Of pure mind entirely separated from matter, men in their circumstances could not long retain the faintest notion; but conscious each of power in himself, and experiencing the effects of power in the sun, they would naturally conceive that luminary to be animated as their bodies were animated. They would feel his influence when above the horizon; they would see him moving from east to west; they would consider him when set as gone to take his repose: and those exertions and intermissions of power being analagous to what they experienced in themselves, they would look upon the sun as a real animal. Thus would the Divinity appear to their untutored minds to be a compound being like man, partly corporeal and partly spiritual; and as soon as they imbibed such notions, though perhaps not before, they may be pronounced to have been absolute idolaters.

When man had once got into this train, their gods would multiply upon them with wonderful rapidity. Darkneſs and cold they could not but perceive to be contrary to light and heat; and not having philosophy enough to distinguish between mere privations and posi-

7 The spirit of light the first god of paganism.

U u tive

Magianism. tive effects, they would consider darkness and cold as entities equally real with light and heat; and attribute these different and contrary effects to different and contrary powers. Hence the spirit or power of darkness was in all probability the second god in the Pagan calendar; and as they considered the power of light as a benevolent principle, the source of all that is good, they must have looked upon the contrary power of darkness as a malevolent spirit, the source of all that is evil. This we know from authentic history to have been the belief of the Persian magi, a very ancient sect, who called their good god *Yazdan*, and also *Ormuzd*, and the evil god *Abraman*. Considering light as the symbol, or perhaps as the body, of *Ormuzd*, they always worshipped him before the fire, the source of light, and especially before the sun, the source of the most perfect light; and for the same reason fires were kept continually burning on his altars. That they sometimes addressed prayers to the evil principle, we are informed by Plutarch in his life of Themistocles; but with what particular rites he was worshipped, or where he was supposed to reside, is not so evident. Certain it is, that his worshippers held him in detestation; and when they had occasion to write his name, they always inverted it (*uṣṣuṣṣy*), to denote the malignity of his nature.

The principles of the magi, though widely distant from pure theism, were much less absurd than those of other idolaters. It does not appear that they ever worshipped their gods by the medium of graven images, or had any other emblems of them than light and darkness. Indeed we are told by Diogenes Laertius and Clemens Alexandrinus, that they condemned all statues and images allowing fire and water to be the only proper emblems or representatives of their gods. And we learn from Cicero *, that at their instigation Xerxes was said to have burnt all the temples of Greece, because the builders of those edifices impiously presumed to inclose within walls the gods, to whom all things ought to be open and free, and whose proper temple is the whole world. To these authorities we may add that of all the historians, who agree, that when magianism was the religion of the court, the Persian monarchs made war upon images, and upon every emblem of idolatry different from their own.

The Magi, however, were but one sect, and not the largest sect of ancient idolaters. The worship of the sun, as the source of light and heat, soon introduced into the calendar of divinities the other heavenly bodies, the moon, the planets, and the fixed stars. Men could not but experience great benefit from those luminaries in the absence of their chief god; and when they had proceeded so far as to admit two divine principles, a good and an evil, it was natural for minds clouded with such prejudices to consider the moon and the stars as benevolent intelligences, sent to oppose the power of darkness whilst their first and greatest divinity was absent or asleep. It was thus, as they imagined, that he maintained (for all held that he did maintain) a constant superiority over the evil principle. Though to astronomers the moon is known to be an opaque body of very small dimensions when compared with a planet or a fixed star, to the vulgar eye she appears much more magnificent than either. By those early idolaters she was considered as the divinity second in rank and in

power; and whilst the sun was worshipped as the king, she was adored as the queen, of heaven. Sabiism.

The earth, considered as the common mother of all things; the ocean, whose waters are never at rest; the air, the region of storms and tempests, and indeed all the elements—were gradually added to the number of divinities; not that mankind in this early age had so far degenerated from the principles of their ancestors as to worship brute matter. If such worship was ever practised, which to us is hardly conceivable, it was at a later period, when it was confined to the very lowest of the vulgar, in nations otherwise highly civilized. The polytheists, of whom we now treat, conceived every thing in motion to be animated, and animated by an intelligence powerful in proportion to the magnitude of the body moved.

This sect of idolaters, which remains in some parts of the East to this day, was known by the name of *Sabians*, which they pretend to have derived from *Sabius* a son of Seth; and among the books in which their sacred doctrines are contained, they have one which they call the book of *Seth*. We need hardly observe, that these are senseless and extravagant fables. The name *Sabian* is undoubtedly derived from the Hebrew word *Tsaba*, which signifies “a host or army;” and this class of polytheists was so called, because they worshipped “the host of heaven;” the *Tsaba hesemim*, against which Moses so pathetically cautions the people of Israel *.

This species of idolatry is thought to have first prevailed in Chaldea, and to have been that from which Abraham separated himself, when, at the command of the true God, he “departed from his country, and from his kindred, and from his father’s house.” But as it nowhere appears that the Chaldeans had fallen into the savage state before they became polytheists and idolaters, and as it is certain that they were not savages at the call of Abraham, their early Sabiism may be thought inconsistent with the account which we have given of the origin of that species of idolatry. If a great and civilized nation was led to worship the host of heaven, why should that worship be supposed to have arisen among savages? Theories, however plausible, cannot be admitted in opposition to facts.

True: but we beg leave to reply, that our account of the origin of polytheism is opposed by no fact; because we have not supposed that the worship of the host of heaven arose among savages only. That savages, between whom it is impossible to imagine any intercourse to have had place, have universally worshipped, as their first and supreme divinities, the *sun, moon, and stars*, is a fact evinced by every historian and by every traveller; and we have shown how their rude and uncultivated state naturally leads them to that species of idolatry. But there may have been circumstances peculiar to the Chaldeans, which led them likewise to the worship of the heavenly host, even in a state of high civilization.—We judge of the philosophy of the ancients by that of ourselves, and imagine that the same refined system of metaphysics was cultivated by them as by the followers of *Descartes* and *Locke*. But this is a great mistake; for so gross were the notions of early antiquity, that it may be doubted whether there was a single man uninspired, who had any notion of mind as a being distinct

Sabian polytheism.

Sabiiſm.

ſinſt and entirely ſeparated from matter (ſee METAPHYSICS, Part III. c. 4). From ſeveral paſſages in the books of Moſes, we learn, that when in the firſt ages of the world the Supreme Being condeſcended to manifeſt his preſence to men, he generally exhibited ſome ſenſible emblem of his power and glory, and declared his will from the miſt of a preternatural fire. It was thus that he appeared to the Jewiſh lawgiver himſelf, when he ſpoke to him from the miſt of a burning buſh; it was by a pillar of cloud and fire that he led the Iſraelites from Egypt to the land of Promiſe; and it was in the miſt of ſmoke, and fire, and thunderings, that the law was delivered from Mount Sinai.—That ſuch manifeſtations of the Divine Preſence would be occaſionally made to the deſcendants of Noah who ſettled in Chaldea ſoon after the deluge, muſt appear extremely probable to every one who admits the authority of the Hebrew Scriptures: and he who queſtions that authority, has no right to make the objection to which we now reply; becauſe it is only from the book of Geneſis that we know the Chaldeans to have been a civilized people when they fell into idolatry. All hiſtories agree in repreſenting the inhabitants of Chaldea as at a very early period corrupted by luxury and ſunk in vice. When this happened, we muſt ſuppoſe that the moral Governor of the univerſe would withdraw from them theſe occaſional manifeſtations of himſelf, and leave them to their own inventions. In ſuch circumſtances, it was not unnatural for a people addiſted to the ſtudy of aſtronomy, who had been taught to believe that the Deity frequently appeared to their anceſtors in a flame of fire, to conſider the ſun as the place of his permanent reſidence, if not as his body. But when either opinion was firmly eſtabliſhed, polytheiſm would be its inevitable conſequence, and the progreſs of Sabiiſm would, in the moſt poliſhed nation, be ſuch as we have traced it among ſavage tribes.

From Chaldea the idolatrous worſhip of the hoſt of heaven ſpread itſelf over all the Eaſt, paſſed into Egypt, and thence into Greece; for Plato affirms †, that “the firſt inhabitants of Greece ſeemed to him to have worſhipped no other gods but the ſun, moon, earth, ſtars, and heavens, as moſt barbarous nations (continues he) ſtill do.” That Sabiiſm, or the worſhip of the hoſt of heaven, was the firſt ſpecies of idolatry, beſides the probability of the thing, and the many alluſions to it in ſacred Scripture, we have the poſitive evidence of the moſt ancient pagan hiſtorians of whoſe writings any part has been tranſmitted to us. Herodotus *, ſpeaking of the religion of the Perſians, ſays, that “they worſhip the ſun, moon, and earth, fire, water, and the winds; and this adoration they have all along paid from the beginning.” He teſtiſies the ſame thing of the ſavage Africans, of whom he affirms †, that they all worſhipped the ſun, and moon, and no other divinity. Diodorus Siculus, writing of the Egyptians ‡, tells us, that “the firſt men looking up to the world above them, and terrified and ſtruck with admiration at the nature of the univerſe, ſuppoſed the ſun and moon to be the principal and eternal gods.” And Sanchoniathon the

Phœnician, a more ancient writer than either of theſe, informs us, in the fragment of his hiſtory preſerved by Eufebius, that “the two firſt mortals were Æon and Protogonus; and their children were Genus and Genea, who inhabited Phœnicia; and when they were ſcorched with the heat, they liſted up their hands to the ſun, whom they believed to be the Lord of Heaven, and called him Baal-ſamem, the ſame whom the Greeks call Zeus.”

Hitherto thoſe divinities were worſhipped in perſon, or, as Dr Prideaux expreſſes it, in their ſacella, or ſacred tabernacles; for the votaries of each directed their devotions towards the planet which they ſuppoſed to be animated by the particular intelligence whom they meant to adore. But theſe orbs, by their riſing and ſetting, being as much below the horizon as above it, and their groſsly ignorant worſhippers not ſuppoſing it poſſible that any intelligence, however divine, could exert its influence but in union with ſome body, ſtatues or pillars were ſoon thought of as proper emblems of the abſent gods. Sanchoniathon, in the fragment already quoted, informs us, that “Hyſpouranios and his brother Oufous, Phœnician patriarchs, erected two pillars, the one to fire, and the other to air or wind, and worſhipped thoſe pillars, pouring out to them libations of the blood of the wild beaſts hunted down in the chace.” As theſe early monuments of idolatry were called *βαιτυλια*, a word evidently derived from the Hebrew *Bethel*, the probability is, that they were altars of looſe ſtones, ſuch as that which was built by Jacob §, § Geneſis, and from him received the ſame name. As his was ch. xxxv. conſecrated to the true God, theiſe were conſecrated to the hoſt of heaven; and the form of conſecration ſeems to have been nothing more than the anointing of the ſtone or pillar with oil (A), in the name of the divinity whom it was intended to repreſent. When this ceremony was performed, the ignorant idolaters, who fancied that their gods could not hear them but when they were viſible, ſuppoſed that the intelligences by which the ſun and planets were animated, took poſſeſſion, in ſome inexplicable manner, of the conſecrated pillars, and were as well pleaſed with the prayers and praiſes offered up before thoſe pillars, as with the devotions which were addreſſed towards the luminaries themſelves.—Hence Sanchoniathon calls them *animated* or *living*, ſtones, *λιθους ἐμψυχους*, from the portion of the Divine Spirit which was believed to reſide in them; and as they were dedicated to the hoſt of heaven, they were generally erected on the tops of mountains; or in countries which, like Egypt, were low and level, they were elevated to a great height by the labour of men.

It has been ſuppoſed, that this praſtice of raiſing the pillars on high places proceeded from a deſire to make the objects of worſhip conſpicuous and magnificent: but we are ſtrongly inclined to believe, that the ereſtors of *βαιτυλια* had ſomething farther in view, and that they thought of nothing leſs than to bring the ſacred ſtone or pillar as near as poſſible to the god whom it repreſented. Whatever be in this, we know that the praſtice itſelf prevailed univerſally through the eaſt; and that

Dæmons. there was nothing which the Jewish legislator more strictly enjoined his people to destroy, than the altars, statues, and pillars, erected for idolatrous worship upon mountains and high places. "Ye shall utterly destroy (says he) all the places wherein the nations which ye shall possess served their gods, upon the *high mountains*, and upon the *hills*, and under every green tree. And ye shall overthrow their *altars*, and break down their *pillars*, and burn their *groves* with fire*."

* Deut. xii. 23. The mention of *groves* by the Hebrew lawgiver, brings to our recollection another species of idolatry, which was perhaps the second in order, as men deviating from the principles of pure theism were more and more intangled in the labyrinths of error. The Chaldeans, Egyptians, and all the eastern nations who believed in a superintending providence, imagined that the government of this world, the care of particular nations, and even the superintendence of groves, rivers, and mountains, in each nation, was committed by the gods to a class of spirits superior to the soul of man, but inferior to those heavenly intelligences which animated the sun, the moon, and the planets. These spirits were by the Greeks called *δαίμονες*, *dæmons*, and by the Romans *genii*. Timæus the Locrian, who flourished before Plato, speaking of the punishment of wicked men, says†, all these things hath Nemesis decreed to be executed in the second period, by the ministry of vindictive terrestrial dæmons, who are overseers of human affairs; to which dæmons, the Supreme God, the ruler over all, hath committed the government and administration of this world, which is made up of *gods*, *men*, and *animals*.

† De Anima Mundi, inter script. a T. Gale, editos.

15
Origin of
dæmon-
worship

Concerning the origin of these intermediate beings, scholars and philosophers have framed various hypotheses. The belief of their existence may have been derived from five different sources.

1. It seems to have been impossible for the limited capacities of those men, who could not form a notion of a God divested of a body and a place, to conceive how the influence and agency of such a being could every instant extend to every point of the universe. Hence, as we have seen, they placed the heavenly regions under the government of a multitude of heavenly gods, the *sun*, the *moon*, and the *stars*. But as the nearest of those divinities was at an immense distance from the earth, and as the intelligence animating the earth itself had sufficient employment in regulating the general affairs of the whole globe, a notion insinuated itself into the untutored mind, that these superior governors of universal nature found it necessary, or at least expedient, to employ subordinate intelligences or *dæmons* as ministers to execute their behests in the various parts of their widely extended dominions.

2. Such an universal and uninterrupted course of action, as was deemed necessary to administer the affairs of the universe, would be judged altogether inconsistent with that state of *indolence*, which, especially in the east, was held an indispensable ingredient in perfect felicity. It was this notion, absurd as it is, which made Epicurus deny the *providence*, whilst he admitted the *existence* of gods. And if it had such an effect upon a philosopher who in the most enlightened ages had many followers, we need not surely wonder if it made untaught idolaters imagine that the governor or governors of the

universe had devolved a great part of their trouble on deputies and ministers.

3. When men came to reflect on the infinite distance between themselves and the gods, they would naturally form a wish, that there might somewhere exist a class of intermediate intelligences, whom they might employ as mediators and intercessors with their far distant divinities. But what men earnestly wish, they very readily believe. Hence the supposed distance of their gods would, among untutored barbarians, prove a fruitful source of intermediate intelligences, more pure and more elevated than human souls.

4. These three opinions may be denominated popular; but that which we are now to state, wherever it may have prevailed, was the offspring of philosophy.—On this earth we perceive a scale of beings rising gradually above each other in perfection, from mere brute matter through the various species of fossils, vegetables, insects, fishes, birds, and beasts, up to man. But the distance between man and God is infinite, and capable of admitting numberless orders of intelligences, all superior to the human soul, and each rising gradually above the other till they reach that point, wherever it may be, at which creation stops. Part of this immense chasm the philosophers perceived to be actually filled by the heavenly bodies; for in *philosophical* polytheism there was one invisible God supreme over all these: but still there was left an immense vacuity between the human species and the moon, which was known to be the lowest of the heavenly host; and this they imagined must certainly be occupied by invisible inhabitants of different orders and dispositions, which they called good and evil *dæmons*.

5. There is yet another source from which the universal belief of good and evil demons may be derived, with perhaps greater probability than from any or all of these. If the Mosaic account of the creation of the world; the peopling of the earth, and the dispersion of mankind, be admitted as true (and a more consistent account has not as yet been given or devised), some knowledge of good and evil *angels* must necessarily have been transmitted from father to son by the channel of oral tradition. This tradition would be corrupted at the same time, and in the same manner, with others of greater importance. When the true God was so far mistaken as to be considered, not as the sole governor of the universe, but only as the self-existent power of light and good, the Devil would be elevated from the rank of a rebellious created spirit to that of the independent power of darkness and evil; the angels of light would be transformed into good demons, and those of darkness into demons that are evil. This account of the origin of dæmonology receives no small support from Plato, who derives one branch of it wholly from tradition. "With respect to those demons (says he‡) who inhabit the space between the earth and the moon, to understand and declare their generation is a task too arduous for my slender abilities. In this case we must credit the report of men of other times, who, according to their own account, were the descendants of the gods, and had, by some means or other, gained exact intelligence of that mystery from their ancestors. We must not question the veracity of the children of the gods, even though they should transgress the bounds

Dæmons.

‡ Timæus.

of

Hero- of probability, and produce no evidence to support their assertions. We must, I say, notwithstanding, give them credit, because they profess to give a detail of facts with which they are intimately acquainted, and the laws of our country oblige us to believe them."

Though these dæmons were generally invisible, they were not supposed to be pure disembodied spirits.— Proclus, in his Commentary upon Plato's *Timæus*, tells us, that "every dæmon superior to human souls consisted of an intellectual mind and an ethereal vehicle." Indeed it is very little probable, that those who gave a body and a place to the Supreme God, should have thought that the inferior orders of his ministers were spirits entirely separated from matter. Plato himself divides the class of dæmons into three orders*; and whilst he holds their souls to be particles or emanations from the divine essence, he affirms that the bodies of each order of dæmons are composed of that particular element in which they for the most part reside. "Those of the first and highest order are composed of pure ether; those of the second order consist of grosser air; and dæmons of the third or lowest rank have vehicles extracted from the element of water. Dæmons of the first and second orders are invisible to mankind. The aquatic dæmons, being invested with vehicles of grosser materials, are sometimes visible and sometimes invisible. When they do appear, though faintly observable by the human eye, they strike the beholder with terror and astonishment." Dæmons of this last order were supposed to have passions and affections similar to those of men; and though all nature was full of them, they were believed to have local attachments to mountains, rivers, and groves, where their appearances were most frequent. The reason of these attachments seems to be obvious. Polytheism took its rise in countries scorched by a burning sun; and dæmons by their composition being necessarily subject in some degree to the influence of heat and cold, it was natural to suppose that they, like men, would delight in the shady grove and in the purling stream. Hence the earliest altars of paganism were generally built in the midst of groves, or on the banks of rivers; because it was believed that in such places were assembled multitudes of those intelligences, whose office it was to regulate the affairs of men, and to carry the prayers and oblations of the devout to the far-distant residence of the celestial gods. Hence too are to be derived the mountain and river gods, with the dryads and hamadryads, the satyrs, nymphs, and fawns, which held a place in the creed of ancient paganism, and make so conspicuous a figure in the Greek and Roman poets.

These different orders of intelligences, which, though worshipped as gods or demigods, were yet believed to partake of human passions and appetites, led the way to the deification of departed heroes and other eminent benefactors of the human race. By the philosophers all souls were believed to be emanations from the divinity; but "gratitude† and admiration, the warmest and most active affections of our nature, concurred to enlarge the object of religious worship, and to make man regard the inventors of arts and the founders of society as having in them more than a common ray of the divinity. So that god-like benefits, bespeaking as it were a god-like mind, the deceased parent of a people was easily advanced into the rank of dæmon. When the religious bias was in so good a train, natural affection would

have its share in promoting this new mode of adoration. Piety to parents would naturally take the lead, as it was supported by gratitude and admiration, the *primum mobile* of the whole system: and in those early ages, the *natural father* of the tribe often happened to be the *political father* of the people, and the founder of the state. Fondness for the offspring would next have its turn; and a disconsolate father, at the head of a people, would contrive to soothe his grief for the untimely death of a favourite child, and to gratify his pride under the want of *succession*, by paying divine honours to its memory." "For a father‡ afflicted with untimely mourning, when he had made an image of his child soon taken away, now honoured him as a god, who was then a dead man, and delivered to those that were under him ceremonies and sacrifices." That this was the origin and progress of the worship of departed souls, we have the authority of the famous fragment of Sanchoniathon already quoted, where the various motives for this species of idolatry are recounted in express words. "After many generations (says he) came *Chryfor*; and he invented many things useful to civil life, for which, after his decease, he was worshipped as a god. Then flourished *Ouranos* and his sister *Ge*, who deified and offered sacrifices to their father *Hyphistos*, when he had been torn in pieces by wild beasts. Afterwards *Cronos* consecrated *Muth* his son, and was himself consecrated by his subjects."

In the reign of Cronos flourished a personage of great reputation for wisdom, who by the Egyptians was called *Thoth*, by the Phœnicians *Taautos*, and by the Greeks *Hermes*. According to Plutarch, he was a profound politician, and chief counsellor to Osiris, then the king, and afterwards the principal divinity, of Egypt: and we are told by *Philo Byblius*, the translator of Sanchoniathon, "that it was this *Thoth* or *Hermes* who first took the matters of religious worship out of the hands of unskilful men, and brought them into due method and order." His object was to make religion serviceable to the interests of the state. With this view he appointed *Osiris* and other departed princes to be joined with the stars and worshipped as gods; and being by Cronos made king of Egypt, he was, after his death, worshipped himself as a god by the Egyptians. To this honour, if what is recorded of him be true, he had indeed a better title than most princes; for he is said to have been the inventor of letters, arithmetic, geometry, astronomy, and hieroglyphics, and was therefore one of the greatest benefactors of the human race which any age or country has ever produced.

That the gods of Greece and Rome were derived from Egypt and Phœnicia, is so universally known, that it is needless to multiply quotations in order to prove that the progress of polytheism among the Greeks and Romans was the same with that which we have traced in more ancient nations. The following translation, however, of the account given by Hesiod of the deification of departed heroes, with which we have been favoured by a learned and ingenious friend, is so just, and in our opinion so beautiful, that we cannot deny ourselves the pleasure of giving it to our readers.

"The gods who dwell on high Olympus' hill,
First fram'd a golden race of men, who liv'd
Under old Saturn's calm auspicious sway.
Like gods they liv'd, their hearts devoid of care,

 National
 and tutelary
 gods.

The deification of departed heroes and statesmen was that which in all probability introduced the universal belief of *national* and *tutelary* gods, as well as the practice of worshipping those gods through the medium of *statues* cut into a *human figure*. When the founder of a state or any other public benefactor was elevated to the rank of a god, as he was believed still to retain human passions and affections, it was extremely natural to suppose that he would regard with a favourable eye that nation for which he had done so much upon earth; that he would oppose its enemies, and protect the laws and institutions which he himself had given it. By indulging the same train of sentiment, each city, and even every family of consequence, found *Lares* and *Penates* among their departed ancestors, to whom they paid the warmest adoration, and under whose protection they believed their private affairs to be placed. As those national and household gods were believed to be in their deified state clothed with airy bodies, so those bodies were supposed to retain the form which their grosser bodies had upon earth. The image of a departed friend might perhaps be formed by the hand of sorrowful affection, before the statue or the shrine of a deity was thought of; but when that friend or benefactor became the object of religious adoration, it was natural for his votaries to enliven their devotion by the view of his similitude. Maximus Tyrius tells us §, that "there is no race of men, whether barbarian or Grecian, living on the sea-coast or on the continent, wandering in deserts or living in cities, which hath not consecrated some kind of symbol or other in honour of the gods." This is certainly true; but there is no good evidence that the first symbols of the gods were statues of men and women. Whilst the sun and other heavenly bodies continued to be the sole objects of religious worship, the symbols consecrated to them were pillars of a *conical* or *pyramidal* figure; and if such pillars are ever called *graven* images by Moses and other ancient writers, it was probably on account of the *allegoric figures* and *characters*, or hieroglyphic writing, with which they were inscribed.

§ Dissert.

20
 Hero-wor-
 ship en-
 grafted on
 the plan-
 etary.

Hitherto we have considered the souls of departed heroes as holding the rank only of demons or demigods; but they gradually rose in the scale of divinities, till they dethroned the heavenly bodies, and became themselves the *dii majorum gentium*. This revolution was effected by the combined operation of the prince and the priest; and the first step taken towards it seems to have been the complimenting of their heroes and public benefactors with the name of that being which was most esteemed and worshipped. "Thus a king for his beneficence was called the *sun*, and a queen for her beauty the *moon*. Diodorus relates, that Sol first reigned

in Egypt, called so from the luminary of that name in the heavens. This will help us to understand an odd passage in the fragment of Sanchoniathon, where it is said that *Cronus had seven sons by Rhea, the youngest of whom was a god as soon as born*. The meaning probably is, that this youngest son was called after some luminary in the heavens to which they paid divine honours; and these honours came in process of time to be transferred to the terrestrial namesake. The same historian had before told us, that the sons of Genos, mortals like their father, were called by the names of the elements—*light, fire, and flame*, of which they had discovered the use."

Worship.

"As this adulation advanced into an established worship, they turned the compliment the other way, and called the planet or luminary after the hero, the better to accustom the people, even in the act of *Planet-Worship*, to this new adoration. Diodorus, in the passage already quoted, having told us, that by the first inhabitants of Egypt the sun and moon were supposed to be the principal and eternal gods, adds, that the former was called *OSIRIS*, and the latter *ISIS*. This was indeed the general practice; for we learn from Macrobius, that the Ammonites called the sun *Moloch*; the Syrians *Adad*; the Arabs *Dionysus*; the Assyrians *Belus*; the Phœnicians *Saturn*; the Carthaginians *Hercules*; and the Palmyrians *Elegabalus*. Again, by the Phrygians the moon was called *Cybele*, or the mother of the gods; by the Athenians *Minerva*; by the Cyprians *Venus*; by the Cretans *Diana*; by the Sicilians *Proserpine*; by others *Hecate*, *Bellona*, *Vesta*, *Urania*, *Lucina*, &c. Philo Byblius explains this practice: "It is remarkable (says he) that the ancient idolators imposed on the *elements*, and on those parts of nature which they esteemed gods, the names of their kings: for the natural gods which they acknowledged were only the sun, moon, planets, elements, and the like; they being now in the humour of having gods of both classes, the *mortal* and the *immortal*."

21
 Which in
 time it sup-
 planted.

"As a farther proof that *hero-worship* was thus superinduced upon the *planetary*, it is worthy of observation, that the first statues consecrated to the *greater* hero-gods—those who were supposed to be *supreme*—were not of a human form, but *conical* or *pyramidal*, like those which in the earliest ages of idolatry were dedicated to the sun and planets. Thus the scholiast on the *Vespæ* of Aristophanes tells us, that the statues of Apollo and Bacchus were *conic* pillars or obelisks; and Pausanias, that the statue of Jupiter Meilichius represented a *pyramid*; that of the Argive Juno did the same, as appears from a verse of Phoronis quoted by Clemens Alexandrinus ‡; and indeed the practice was † universal as well amongst the early barbarians as amongst the Greeks. But it is well known that the ancients represented the *rays of light* by pillars of a conical or pyramidal form; and therefore it follows, that when they erected such pillars as representatives of their hero-gods, these latter had succeeded to the titles, rights, and honours of the *natural* and *celestial divinities**."

But though it seems to be certain that *hero-worship* was thus engrafted on the *planetary*, and that some of those heroes in process of time supplanted the planets themselves, this was such a revolution in theology as could not have been suddenly effected by the united influence of the prince and the priest. We doubt not the

Progress of
this revolution in
theology.

the fact that SOL was believed to have reigned in Egypt, and was afterwards worshipped under the name of *Osiris*; but it was surely impossible to persuade any nation, however stupid or prone to idolatry, that a man, whom they remembered discharging the duties of their sovereign and legislator, was the identical sun whom they beheld in the heavens. *Osiris*, if there was in Egypt a king of that name, may have been deified immediately after his death, and honoured with that worship which was paid to good *dæmons*; but he must have been dead for ages before any attempt was made to persuade the nation that he was the *supreme God*. Even then great address would be requisite to make such an attempt successful. The prince or priest who entered upon it would probably begin with declaring from the oracle, that the divine intelligence which animates and governs the sun had descended to earth and animated the person of their renowned legislator; and that, after their laws were framed, and the other purposes served for which the descent was made, the same intelligence had returned to its original residence and employment among the celestials. The possibility of this double transmigration from heaven to earth and from earth to heaven, would without difficulty be admitted in an age when the pre-existence of souls was the universal belief. Having proceeded thus far in the apotheosis of dead men, the next step taken in order to render it in some degree probable that the early founders of states, and inventors of arts, were divine intelligences clothed with human bodies, was to attribute to one such benefactor of mankind the actions of many of the same name. *Vossius*, who employed vast erudition and much time on the subject, has proved, that before the æra of the Trojan wars most kings who were very powerful, or highly renowned for their skill in legislation, &c. were called *Jove*; and when the actions of all these were attributed to one *Jove of Crete*, it would be easy for the crafty priest, supported by all the power and influence of the state, to persuade an ignorant and barbarous people, that he whose wisdom and heroic exploits so far surpassed those of ordinary men must have been the supreme God in human form.

23
Vices of
the pagan
gods.

This short sketch of the progress of polytheism and idolatry will enable the reader to account for many circumstances recorded of the pagan gods of antiquity, which at first view seem very surprising, and which at last brought the whole system into contempt among the philosophers of Athens and Rome. The circumstances to which we allude are the immoral characters of those divinities, and the abominable rites with which they were worshipped. Jupiter, Apollo, Mars, and the whole rabble of them, are described by the poets as ravishers of women and notorious adulterers. *Hermes* or *Mercury* was a thief, and the god of thieves. *Venus* was a prostitute, and *Bacchus* a drunkard. The malice and revenge of *Juno* were implacable; and so little regard was any of them supposed to pay to the laws of honour and rectitude, that it was a common practice of the Romans, when besieging a town, to evocate the tutelar deity, and to tempt him by a reward to betray his friends and votaries †. In a word, they were, in the language of the poet,

et Macroh,
Satur.
lib. iii, c. 9.

“ Gods partial, changeful, passionate, unjust,
“ Whose attributes were rage, revenge, and lust.”

This was the natural consequence of their origin. Having once animated human bodies, and being supposed still to retain human passions and appetites, they were believed, in their state of deification, to feel the same for.

Worship.
24
Accounted

sensual desires which they had felt upon earth, and to pursue the same means for their gratification. As the men could not well attempt to surpass the gods in purity and virtue, they were easily persuaded by artful and profligate priests, that the most acceptable worship which could be rendered to any particular deity was to imitate the example of that deity, and to indulge in the practices over which he presided. Hence the worship of *Bacchus* was performed during the night by men and women mixing in the dark after intemperate eating and drinking. Hence too it was the practice in *Cyprus* and some other countries to sacrifice to *Venus* the virginity of young women some days before their marriage, in order, as it was pretended, to secure their chastity ever afterwards; and, if *Herodotus* may be credited, every woman among the *Babylonians* was obliged once in her life to prostitute herself in the temple of the goddess *Myllite* (*Venus*), that she might thenceforward be proof against all temptation.

The progress of polytheism, as far as we have traced it, has been regular; and after the enormous error of idolatry forsaking the worship of the true God was admitted, every subsequent step appears to be natural. It would be no difficult task to prove that it has likewise been universal.

25
Progress of
idolatry re-
gular and
universal.

Sir William Jones, the learned president of the Asiatic Society, has discovered such a striking resemblance between the gods of ancient Greece and those of the pagans of Hindostan †, as puts it beyond a doubt that those divinities had the same origin. The *GANESA* of the Hindoos he has clearly proved to be the *JANUS* of the Greeks and Romans. As the latter was represented with two and sometimes with four faces, as emblems of prudence and circumspection, the former is painted with an elephant's head, the well-known symbol among the Indians of sagacious discernment. The *SATURN* of Greece and Rome appears to have been the same personage with the *MENU* or *SATYAVRATA* of Hindostan, whose patronymic name is *VAIVASVATA*, or *child of the sun*; which sufficiently marks his origin. Among the Romans there were many Jupiters, of whom one appears from *Ennius* to have been nothing more than the firmament personified.

† Asiatic
Researches,
vol. i.

Aspice hoc sublime candens, quem invocant omnes
JOVEM.

But this Jupiter had the same attributes with the Indian god of the visible heavens called *INDRA* or the *king*, and *DIVESPETIR* or the *lord of the sky*, whose consort is *Sachi*, and whose weapon is *vajra* or the thunderbolt. *INDRA* is the regent of winds and showers; and though the east is peculiarly under his care, yet his Olympus is the north-pole, allegorically represented as a mountain of gold and gems. With all his power he is considered as a subordinate deity, and far inferior to the Indian triad *BRAHMA*, *VISHNOU*, and *MAHADEVA* or *SIVA**, who are three forms of one and the same godhead. The president having traced the resemblance between the idolatry of Rome and India through many other gods, observes, that “ we must not be surprised at finding, on a close examination, that the characters of all the pagan deities melt into each other, and at last into

26

Hero-
Worship.

into one or two; for it seems a well-founded opinion, that the whole crowd of gods and goddesses in ancient Rome, and likewise in Hindoستان, mean only the powers of nature, and principally those of the sun, expressed in a variety of ways, and by a multitude of fanciful names."

Nor is it only in Greece, Rome, Egypt, and India, that the progress of idolatry has been from planetary to hero-worship. From every account which modern travellers have given us of the religion of savage nations, it appears that those nations adore, as their first and greatest gods, the sun, moon, and stars; and that such of them as have any other divinities have proceeded in the same road with the celebrated nations of antiquity, from the worship of the heavenly bodies to that of celestial demons, and from celestial demons to the deification of dead men. It appears likewise that they universally believe their hero-gods and demi-gods to retain the passions, appetites, and propensities of men.

27
Scandinavian and
Saxon idolatry.

* Plate
CCXXI.

That the Scandinavians and our Saxon ancestors had the same notions of the gods with the other pagans whose opinions we have stated, is evident from their calling the days of the week by the names of their divinities, and from the forms of the statues by which those divinities were represented *. 1. The idol of the sun, from which *Sunday* is derived, among the Latins *dies Solis*, was placed in a temple, and adored and sacrificed to; for they believed that the sun did co-operate with this idol. He was represented like a man half naked, with his face like the sun, holding a burning wheel with both hands on his breast, signifying his course round the world; and by its fiery gleams, the light and heat with which he warms and nourisheth all things.— 2. The idol of the moon, from which cometh our *Monday*, *dies Luna*, anciently *Moonday*, appears strangely singular, being habited in a short coat like a man. Her holding a moon expresses what she is; but the reason of her short coat and long-eared cap is lost in oblivion.— 3. *Tuisco*, the most ancient and peculiar god of the Germans, represented in his garment of a skin according to their ancient manner of clothing, was next to the sun and moon, the idol of highest rank in the calendar of northern paganism. To him the third day in the week was dedicated; and hence is derived the name *Tuesday*, anciently *Tuisday*, called in Latin *dies Martis*, though it must be confessed that Mars does not so much resemble this divinity as he does Odin or Woden.

4. *Woden* was a valiant prince among the Saxons. His image was prayed to for victory over their enemies; which, if they obtained, they usually sacrificed the prisoners taken in battle to him. Our *Wednesday* is derived from him, anciently *Wodnesday*. The northern histories make him the father of *Thor*, and *Frigo* to be his wife.

5. *Thor* was placed in a large hall, sitting on a bed canopied over, with a crown of gold on his head, and 12 stars over it, holding a sceptre in the right hand. To him was attributed the power over both heaven and

earth; and that as he was pleased or displeased he could send thunder, tempests, plagues, &c. or fair, seasonable weather, and cause fertility. From him our *Thursday* derives its name, anciently *Thorfsday*; among the Romans *dies Jovis*, as this idol may be substituted for Jupiter.

6. *Frigo* represented both sexes, holding a drawn sword in the right hand and bow in the left; denoting that women as well as men should fight in times of need. She was generally taken for a goddess; and was reputed the giver of peace and plenty, and causer of love and amity. Her day of worship was called by the Saxons *Frigedeag*, now *Friday*, *dies Veneris*; but the habit and weapons of this figure have a resemblance of Diana rather than Venus.

7. *Seater*, or *Crodo*, stood on the prickly back of a perch. He was thin-visaged and long-haired, with a long beard, bare-headed and bare-footed, carrying a pail of water in his right hand wherein are fruit and flowers, and holding up a wheel in his left, and his coat tied with a long girdle. His standing on the sharp fins of this fish signified to the Saxons, that by worshipping him they should pass through all dangers unhurt; by his girdle flying both ways was shown the Saxons freedom; and by the pail with fruit and flowers, was denoted that he would nourish the earth. From him, or from the Roman deity Saturn, comes *Saturday*.

Such were the principal gods of the northern nations: but these people had at the same time inferior deities, who were supposed to have been translated into heaven for their heroic deeds, and whose greatest happiness consisted in drinking *ale* out of the skulls of their enemies in the *hall of Woden*. But the limits prescribed to the present article do not permit us to pursue this subject; nor is it necessary that we should pursue it. The attentive reader of the article MYTHOLOGY, of the histories given in this work of the various divinities of paganism, and of the different nations by whom those divinities were worshipped, will perceive that the progress of polytheism and idolatry has been uniform over the whole earth.

There is, however, one species of idolatry more wonderful than any thing that has yet been mentioned, of which our readers will certainly expect some account. It is the worship of *brutes*, *reptiles*, and *vegetables*, among the Egyptians. To the Greeks and Romans, as well as to us, that superstition appeared so monstrous, that to enumerate every hypothesis, ancient and modern, by which philosophers have endeavoured to account for it, would swell this article beyond all proportion. Brute-worship prevailed at so early a period in Egypt, that the philosophers of antiquity, whose writings have descended to us, had little or no advantage over the moderns in pursuing their researches into its origin; and among the modern hypotheses, those of *Mosheim* and *Warburton* appear to us by much the most probable of any that we have seen (B). The former of these learned writers attributes it wholly to the policy of the prince and

Brute-
Worship.

(B) There is, however, another hypothesis worthy of some attention, if it were only for the learning and ingenuity of its author. The celebrated Cudworth infers, from the writings of Philo and other Platonists of the Alexandrian school, that the ancient Egyptians held the Platonic doctrine of ideas existing from eternity, and constituting, in one of the persons of the godhead, the intelligible and archetypal world. (See PLATONISM.) Philo,

Brute-
Worship.

and the craft of the priest. The latter contends, with much earnestness and ingenuity, that it resulted from the use of hieroglyphic writing. We are strongly inclined to believe that both these causes contributed to the production of so portentous an effect; and that the use of hieroglyphics as sacred symbols, after they were laid aside in civil life, completed that wonderful superstition which the craft of the priest and the policy of the prince had undoubtedly begun.

neumon
and Ibis.

We learn from Herodotus*, that in his time the number of useful animals in Egypt was so small as hardly to be sufficient for tillage and the other purposes of civil life; whilst serpents and other noxious animals, such as the crocodile, wolf, bear, and hippopotamus, abounded in that country. From this fact Motheim very naturally concludes†, that the founders of society and government in Egypt would by every art endeavour to increase the number of useful animals as the number of inhabitants increased; and that with this view they would make it criminal to kill or even to hurt sheep, cows, oxen, or goats, &c. whilst they would wage perpetual war upon the noxious animals and beasts of prey. Such animals as were assisting to them in the carrying on of this warfare would be justly considered as in a high degree useful to society. Hence the most grievous punishments were decreed against the killing, or so much as the wounding, of the *ichneumon* and *ibis*; because the former was looked upon as the instinctive enemy of the crocodile, and the latter of every species of serpents*. The learned writer, however, observes, that in Egypt as in other countries, people would be tempted to sacrifice the good of the public to the gratification of their own appetites, and sometimes even to the indulgence of a momentary caprice. Hence he thinks it was found necessary to strengthen the authority of the laws enacted for the preservation of useful animals by the sanctions of religion: and he says, that with this view the priests declared that certain animals were under the immediate protection of certain gods; that some of those animals had a divine virtue residing in them; and that they could not be killed without the most sacrilegious wickedness, incurring the highest indignation of the gods. When once the idolatrous Egyptians were persuaded that certain animals were sacred to the immortal gods, and had a divine virtue residing in them, they could not avoid viewing those animals with some degree of veneration; and the priests, taking advantage of the superstition of the peo-

VOL. XV.

ple, appointed for each species of sacred animals appropriated rites and ceremonies, which were quickly followed with building shrines and temples to them, and approaching them with oblations, and sacrifices, and other rites of divine adoration.

To corroborate this hypothesis, he observes, that, besides the animals sacred over all Egypt, each province and each city had its particular animal to which the inhabitants paid their devotions. This arose from the universal practice among idolaters of consecrating to themselves *Lares* and *Penates*; and as the animals which were worshipped over the whole kingdom were considered as sacred to the *Dii majorum gentium*, so the animals whose worship was confined to particular cities or provinces were sacred to the *Lares* of those cities and provinces. Hence there was in Upper Egypt a city called *Lycopolis*, because its inhabitants worshipped the wolf, whilst the inhabitants of *Thebes* or *Heliopolis* paid their devotions to the eagle, which was probably looked upon as sacred to the sun. Our author, however, holds it as a fact which will admit of no dispute, that there was not one noxious animal or beast of prey worshipped by the Egyptians till after the conquest of their country by the Persians. That the earliest gods of Egypt were all benevolent beings, he appeals to the testimony of Diodorus Siculus; but he quotes Herodotus and Plutarch, as agreeing that the latter Egyptians worshipped an evil principle under the name of *Typhon*. This *Typhon* was the inveterate enemy of *Osiris*, just as *Abraman* was of *Ormuzd*; and therefore he thinks it in the highest degree probable that the Egyptians derived their belief of two self-existent principles, a good and an evil, from their Persian conquerors, among whom that opinion prevailed from the earliest ages.

From whatever source their belief was derived, *Typhon* was certainly worshipped in Egypt, not with a view of obtaining from him any good, for there was nothing good in his nature, but in hopes of keeping him quiet, and averting much evil. As certain animals had long been sacred to all the benevolent deities, it was natural for a people so besotted with superstition as the Egyptians to consecrate emblems of the same kind to their god *Typhon*. Hence arose the worship of *serpents*, *crocodiles*, *bears*, and other noxious animals and beasts of prey. It may indeed seem at first sight very inconsistent to deify such animals, after they had been in the practice for ages of worshipping others for being

X x

their

Philo, he observes, did not himself consider those ideas as so many distinct *substances* and *animals*, much less as *gods*; but he mentions others who deified the whole of this intelligible system as well as its several parts. Hence, when they paid their devotions to the *sensible sun*, they pretended to worship only the divine *idea* or *archetype* of that luminary: and hence, thinks our learned author, the ancient Egyptians, by falling down to bulls, and cows, and crocodiles, meant at first to worship only the divine and eternal *ideas* of those animals. He allows, indeed, that as few could entertain any thoughts at all of those eternal ideas, there were scarcely any who could persuade themselves that the *intelligible system* had so much reality in it as the *sensible things of nature*; and hence he thinks the devotion which was originally paid to the divine ideas had afterwards no higher object than the brutes and vegetables of which those ideas were the eternal patterns.

This hypothesis is ingenious, but not satisfactory. There is no evidence that the mysterious doctrine of Plato concerning *ideas* had anywhere been thought of for ages after brute-worship was established in Egypt. Of the state of Egyptian theology at that early period, Philo, and the other philosophers of the Alexandrian school, had no better means of forming a judgment than we have; and they laboured under many Grecian prejudices, which must have prevented them from judging with our impartiality.

Brute-
Worship.

Brute-
Worship.

their destroyers; but it is to be remembered, that long before the deification of crocodiles, &c. the real origin of brute-worship was totally forgotten by the people, if they were ever acquainted with it. The crafty priest who wishes to introduce a gainful superstition, must at first employ some plausible reason to delude the multitude; but after the superstition has been long and firmly established, it is obviously his business to keep its origin out of sight.

Such is Mosheim's account of the origin and progress of that species of idolatry which was peculiar to Egypt; and with respect to the rise of brute-worship, it appears perfectly satisfactory. But the Egyptians worshipped several species of vegetables; and it surely could be no part of the policy of wise legislators to preserve them from destruction, as vegetables are useful only as they contribute to animal subsistence. We are therefore obliged to call in the aid of Warburton's hypothesis to account for this branch of Egyptian superstition.

* Div. Leg.
book 4th,
sect. 4th.32
Continued
by the
means of
hierogly-
phic writ-
ting, and

That learned and ingenious author having proved *, with great clearness and strength of argument, that hieroglyphic writing was prior to the invention of alphabetic characters; and having traced that kind of writing from such rude pictures, as those which were in use among the Mexicans, through all the different species of what he calls *eurilogic*, *tropical*, and *symbolic* hieroglyphics (See *HIEROGLYPHICS*)—shows, by many quotations from ancient authors, that the Egyptian priests wrapt up their theology in the symbolic hieroglyphics, after alphabetic characters had banished from the transactions of civil life a mode of communicating information necessarily so obscure. These symbols were the figures of animals and vegetables, denoting, from some imaginary analogy, certain attributes of their divinities; and when the vulgar, forgetting this analogy, ceased to understand them as a species of writing, and were yet taught to consider them as sacred, they could not well view them in any other light than as emblems of the divinities whom they adored. But if rude sculptures upon stone could be emblematical of the divinities, it was surely not unnatural to infer, that the living animals and vegetables which those sculptures represented must be emblems of the same divinities more striking and more sacred. Hence the learned author thinks arose that wonderful superstition peculiar to the Egyptians, which made them worship not only animals and vegetables, but also a thousand chimeras of their own creation; such as figures with human bodies and the heads or feet of brutes, or with brutal bodies and the heads and feet of men.

These two hypotheses combined together appear to us to account sufficiently for the idolatry of Egypt, monstrous as it was. We are persuaded, that with respect to the *origin* of brute-worship, Mosheim is in the right (c); and it was a very easy step for people in fo

good training to proceed upon the crutches of hieroglyphics to the worship of plants and those chimeras, which, as they never had a real existence in nature, could not have been thought of as emblems of the divinity, had they not been used in that symbolic writing which Warburton so ably and ingeniously explains.

To this account of the origin of brute-worship we are fully aware that objections will occur. From a learned friend, who perused the article in manuscript, we have been favoured with one which, as it is exceedingly plausible, we shall endeavour to obviate. "Brute-worship was not peculiar to Egypt. The Hindoos, it is well known, have a religious veneration for the cow and the alligator; but there is no evidence that in India the number of useful animals was ever so small as to make the interference of the prince and the priest necessary for their preservation; neither does it appear that the Hindoos adopted from any other people the worship of a self-existent principle of evil." Such is the objection. To which we reply,

That there is every reason to believe that brute-worship was introduced into India by a colony of Egyptians at a very remote period. That between these two nations there was an early intercourse, is universally allowed: and though the learned president of the Asiatic Society has laboured to prove, that the Egyptians derived all that wisdom for which they were famed, as well as the rudiments of their religious system, from the natives of Hindostan, he does not appear to us to have laboured with success. To examine his arguments at length would swell this article beyond its due proportion; and we have noticed some of them elsewhere (see *PHILOLOGY*, n° 33 and 39.) At present we shall only observe, that Sesostris undoubtedly made an inroad into India, and conquered part of the country, whilst we nowhere read of the Hindoos having at any time conquered the kingdom of Egypt. Now, though the victors have sometimes adopted the religion of the vanquished, the contrary has happened so much more frequently, and is in itself a process so much more natural, that this single circumstance affords a strong presumption that the Egyptian monarch would rather impose his gods upon the Hindoos than adopt theirs and carry them with him to Egypt. Brute-worship might likewise be introduced into Hindostan by those vast colonies of Egyptians who took refuge in that country from the tyranny and oppression of the shepherd-kings. That such colonies did settle on some occasion or other in India, seems undeniable from monuments still remaining in that country of forms which could hardly have occurred to a native of Asia, though they are very natural as the workmanship of Africans. But we need not reason in this manner. We have seen a manuscript letter from Mr Burt, a learned surgeon in Bengal, and a member of the Asiatic Society, which puts it beyond a doubt that great numbers of Egyptians had at a very early

Brute-
Worship.31
Carried
from E-
gypt into
India.

(c) To prove that it was merely to preserve and increase the breed of useful animals in Egypt, that the prince and the priest *first* taught the people to consider such animals as sacred, he argues thus: "Hæc ita esse, non ex eo tantum liquet, quod paulo ante observavi, nullas bestias universo Ægyptiorum populo sacras fuisse, præter eas, quæ manifestam regioni utilitatem comparant; sed inde quoque apparet, quod longe major ratio habita fuit semellarum inter animalia, quam marium. Boves diis immolare licebat, vaccas nullo modo. Canes fœmina contumulabantur, non item mares." *Leges HERODOTI, Histor. lib. ii. cap. 41. & cap. 67.*

Theogony. early period not only settled in Hindostan, but also brought with them writings relating to the history of their country. As the shepherd-kings were enemies to the arts and to literature, it is probable that this settlement took place on their conquest of Egypt. Mr Burt's words are: "Mr Wilford, lieutenant of engineers, has extracted most wonderful discoveries from the Shanferit records; such as the origin and history of the Egyptian pyramids, and even the account of the expense in their building." Upon our hypothesis there is nothing incredible in this account; upon the hypothesis of Sir William Jones, it is not easy to be conceived how the history of *Egyptian* pyramids could have found a place in the *Shanferit* records.

We may admit that the Hindoos have never adopted from the Persians or Egyptians the worship of an independent principle of evil, and yet dispose of the other part of the objection with very little difficulty. It will be seen by and bye, that the bramins believe a kind of triad of hypostases in the divine nature, of which one is viewed as the *destroyer*, and known by several names, such as *Siva* and *Isvara*. When brute-worship was introduced into Hindostan, it was not unnatural to consider the alligator as emblematical of *Isvara*; and hence in all probability it is that the Hindoos believe that a man cannot depart more happily from this world than by falling into the Ganges, and being devoured by one of those sacred animals. Upon the whole, the brute-worship of the Hindoos, instead of militating against our account of that monstrous superstition as it prevailed in Egypt, seems to lend no small support to that account, as there was unquestionably an early intercourse between the two nations, and as colonies of Egyptians settled in India. To him who is not satisfied with our reasoning on this subject, we beg leave to recommend an attentive perusal of Maurice's *Indian Antiquities*, where he will find many facts brought together, which tend to prove that Egypt has a just claim to a higher antiquity than India.

32
Polytheists
acknow-
ledged one
supreme
God,

Having thus traced the rise and progress of polytheism and idolatry as they prevailed in the most celebrated nations of antiquity, we now proceed to inquire into the real opinions of those nations concerning the nature of the gods whom they adored. And here it is evident from the writings of Homer, Hesiod, and the other poets, who were the principal theologians among the Greeks and Romans, that though heaven, earth, hell, and all the elements, were filled with divinities, there was yet one who, whether called *Jove*, *Osiris*, *Ormuzd*, or by any other title, was considered as supreme over all the rest. "Whence each of the gods was generated (says Herodotus*), or whether they have all existed from eternity, and what are their *forms*, is a thing that was not known till very lately; for Hesiod and Homer were, as I suppose, not above four hundred years my seniors; and these were they who introduced

* Lib. 2.
c. 51.

the theogony among the Greeks, and gave the gods their several names." Now Hesiod †, towards the beginning of his theogony, expressly invokes his muse to celebrate in suitable numbers the generation of the immortal gods who had sprung from the earth, the dark night, the starry heavens, and the salt sea. He calls upon her likewise to say, "in what manner the gods, the earth, the rivers, ocean, stars, and firmament, were generated, and what divine intelligences had sprung from them of benevolent dispositions towards mankind." From this invocation, it is evident that the poet did not consider the gods of Greece as self-existent beings: neither could he look upon them as *creatures*; for of creation the ancient Greeks had no conception (see METAPHYSICS, n° 264.); but he considered them as emanations coeval with the earth and heavens, from some superior principles; and by the divine intelligences sprung from them, there cannot be a doubt but that he understood benevolent demons. The first principles of all things, according to the same Hesiod, were *Chaos*, and *Tartarus*, and *Love*; of which only the last being active, must undoubtedly have been conceived by this father of Grecian polytheism to be the greatest and only self-existing god. This we say must undoubtedly have been Hesiod's belief, unless by *Tartarus* we here understand a self-existent principle of evil; and in that case his creed will be the same with that of the ancient Persians, who, as we have seen, believed in the self-existence as well of *Abraman* as of *Ormuzd*.

Hesiod is supposed to have taken his theology from Orpheus; and it is evident that his doctrine concerning the generation of the gods is the same with that taught in certain verses* usually attributed to Orpheus, in which Love and Chaos are thus brought together. "We will first sing (says the poet) a pleasant and delightful song concerning the ancient Chaos, how the heavens, earth, and seas, were formed out of it; as also concerning that all-wise Love, the oldest and self-perfect principle, which actively produced all these things, separating one from another." In the original passage, Love is said not only to be *πλουμναις* of much wisdom or sagacity, and therefore a real intelligent substance; but also to be *πρεσβυτατος* and *αυτοτελης* the oldest and self-perfect, and therefore a being of superior order to the other divinities who were generated together with the elements over which they were conceived to preside.

17. ed.
Steph.

With the theology of Homer our readers of all descriptions are so well acquainted, that we need not swell the article with quotations, to prove that the father of epic poetry held *Jove* to be the father of gods and men. But the doctrine of the poets was the creed of the vulgar Greeks and Romans; and therefore we may conclude, that those nations, though they worshipped gods and lords innumerable, admitted but one, or at the most two (p), self-existent principles; the one good and the other evil. It does not indeed appear, that in the

X x z system

(p) Plutarch is commonly supposed, and we think justly supposed, to have been a believer in two self-existent principles, a good and an evil. His own opinion, whatever it was, he declares (*de Isid et Osiride*) to have been most ancient and universal, and derived from theologers and lawgivers by poets and philosophers. "Though the first author of it be unknown yet (says he) it hath been so firmly believed everywhere, that traces of it are to be found in the sacrifices and mysteries both of the *barbarians* and the *Greeks*. There is a confused mixture of good and evil in every thing, and nothing is produced by nature *pura*. Wherefore

Theogony. system of vulgar paganism the subordinate gods were accountable to their chief for any part of their conduct, except when they transgressed the limits of the provinces assigned them. Venus might conduct the amours of heaven and earth in whatever manner she pleased; Minerva might communicate or withhold wisdom from any individual with or without reason; and we find, that in Homer's battles the gods were permitted to separate into parties, and to support the Greeks or Trojans according as they favoured the one or the other nation. Jove indeed sometimes called them to order; but his interference was thought partial, and an instance of tyrannical force rather than of just authority. The vulgar Greeks, therefore, although they admitted but one, or at most two, self-existent principles, did not consider the inferior divinities as mediators between them and the supreme, but as gods to whom their worship was on certain occasions to be ultimately directed.

35 Creed of the philosophers and
The creed of the philosophers seems to have been different. Such of them as were theists, and believed in the administration of Providence, admitted of but one God, to whom worship was ultimately due; and they adored the subordinate divinities as his children and ministers, by whom the course of Providence was carried on. With respect to the origin of those divinities,

*** Timæus.** Plato is very explicit; where he tells us*, that "when all the gods, both those who move visibly round the heavens, and those who appear to us as often as they please, were generated, that God, who made the whole universe, spoke to them after this manner: Ye gods of gods, of whom I myself am father, attend." Cicero teaches the very same doctrine with Plato concerning the gods†; and Maximus Tyrius, who seems to have understood the genius of polytheism as thoroughly as any man, gives us the following clear account of that system as received by the philosophers.

† Tuse. Quest. lib. I. c. 29. et de Nat. Deorum, passim.
‡ Differt. I. "I will now more plainly declare my sense‡ by this similitude: Imagine a great and powerful kingdom or principality, in which all agree freely and with one consent to direct their actions according to the will and command of one supreme king, the oldest and the best; and then suppose the bounds and limits of this empire not to be the river Halys, nor the Hellespont, nor the

Theogony. Meotian lake, nor the shores of the ocean; but heaven above, and the earth beneath. Here then let that great king sit immovable, prescribing to all his subjects laws, in the observance of which consist their safety and happiness: the partakers of his empire being many, both visible and invisible gods; some of which that are nearest, and immediately attending on him, are in the highest regal dignity, feasting as it were at the same table; others again are their ministers and attendants; and a third sort are inferior to them both: and thus you see how the order and chain of this government descends down by steps and degrees from the supreme God to the earth and men." In this passage we have a plain acknowledgment of one supreme God, the sovereign of the universe, and of three inferior orders of gods, who were his ministers in the government of the world; and it is worthy of observation, that the same writer calls these intelligences θεοὺς θεοῦ παῖδας καὶ φίλους, *gods, the sons and friends of God*. He likewise affirms, that all ranks of men, and all nations on earth, whether barbarous or civilized, held the same opinions respecting one supreme Numen and the generation of the other gods.

"If there were a meeting (says he*) called of all these several professions, a painter, a statuary, a poet, and a philosopher, and all of them were required to declare their sense concerning *the God*; do you think that the painter would say one thing, the statuary another, the poet a third, and the philosopher a fourth? No; nor the Scythian neither, nor the Greek, nor the Hyperborean. In other things we find men speaking very discordantly, all men as it were differing from all. But amidst this war, contention, and discord, you may find everywhere, throughout the whole world, one uniform law and opinion, that there is **ONE GOD, THE KING AND FATHER OF ALL**, and many gods, the sons of God, who reign with God. These things both the Greek and barbarian affirm, both the inhabitants of the continent and of the sea-coast, both the wise and the unwise."

This account of philosophical polytheism receives no small support from the Asiatic Researches of Sir William Jones. "It must always be remembered (says that accomplished scholar), that the learned Indians, as they are instructed by their own books, acknowledge only

36

Indian Bramins.

fore it is not one only dispenser of things, who, as it were, out of several vessels distributeth these several liquors of good and evil, mingling them together, and dashing them as he pleases; but there are two distinct and contrary powers or principles in the world, one of them always leading, as it were to the right hand, but the other tugging the contrary way. For if nothing can be made without a cause, and that which is good cannot be the cause of evil, there must needs be a distinct principle in nature for the production of evil as well as good."

That this is palpable manicheism (see MANICHEISM), appears to us so very evident, as to admit of no debate. It appeared in the same light to the learned Cudworth; but that author labours to prove that Plutarch mistook the sense of Pythagoras, Empedocles, Heraclitus, Anaxagoras, and Plato, when he attributed to them the same opinions which were held by himself. Mosheim, on the other hand, has put it beyond a doubt, that whatever was Plutarch's belief respecting the origin of evil and the existence of two independent principles, it was taken implicitly from the writings of Plato. But the pious chancellor of *Göttingen*, actuated by the same motives with Cudworth, wishes to persuade his readers, that by Plato and Plutarch nothing *alive* was understood by their evil principle but only *that tendency to confusion*, which was then deemed inseparable from matter. But that something more was meant seems undeniable; for immediately after the words which we have quoted, Plutarch proceeds to affirm that the wisest men declare θεοὺς εἶναι δύο καθάπερ ἀντιτεχνούς, *that there are two gods, as it were of contrary trades or crafts*, of which one is the author of all good and the other of all evil. See Mosheim. ed. Cudworth. *System. Intellect.* lib. i. cap. 4. § 13.

Theogony. only one Supreme Being, whom they call BRAHME, or THE GREAT ONE, in the neuter gender. They believe his essence to be infinitely removed from the comprehension of any mind but his own; and they suppose him to manifest his power by the operation of his divine spirit, whom they name VISHNOU the *pervader*, and NE'RA'YAN or *moving on the waters*, both in the masculine gender; whence he is often denominated the *first male*. When they consider the divine power as exerted in *creating* or giving existence to that which existed not before, they call the deity BRAHMA'; when they view him in the light of *destroyer*, or rather *changer of forms*, they give him a thousand names, of which SIVA, ISWARA, and MAHADEVA, are the most common; and when they consider him as the preserver of created things, they give him the name of VISHNOU. As the soul of the world, or the pervading *mind*, so finely described by Virgil, we see JOVE represented by several Roman poets; and with great sublimity by Lucan in the well known speech of Cato concerning the Ammonian oracle. 'Jupiter is wherever we look, wherever we move.' This is precisely the Indian idea of VISHNOU: for since the power of preserving created things by a superintending providence belongs eminently to the godhead, they hold that power to exist transcendently in the *preserving* member of the triad, whom they suppose to be EVERYWHERE ALWAYS, not in substance, but in spirit and energy." This supreme god BRAHME, in his triple form, is the only self-existent divinity acknowledged by the philosophical Hindoos. The other divinities GENESA, INDRA, CUVERA, &c. are all looked upon either as his creatures or his children; and of course are worshipped only with inferior adoration.

37
Why the philosophers worshipped the inferior divinities.

It was upon this principle of the generation of the gods, and of their acting as ministers to the supreme *Numen*, that all the philosophers of Greece, who were not atheists, worshipped many divinities, though they either openly condemned or secretly despised the traditions of the poets respecting the amours and villanies of Jupiter, Venus, Mercury, and the rest of the tribe. It was the same principle sincerely admitted, and not an ill-timed jest, as has been absurdly supposed, that made Socrates, after he had swallowed the poison, request his friend to offer a votive cock for him to Esculapius.

But a theogony was not peculiar to the Greeks, Romans, and the Hindoos; it made part of every system of polytheism. Even the Egyptians themselves, the grossest of all idolaters, believed in one self-existing God, from whom all their other divinities descended by generation. This appears probable from the writings of Horus Apollo, Jamblicus, Porphyry, and many other ancient authors; but if the inscription on the gates of the temple of *Neith* in *Sais*, as we have it from Plutarch and Proclus, be genuine, it will admit of no doubt. This famous inscription, according to the last of these writers, was to this purpose: "I am whatever is, what-

ever shall be, and whatever hath been. My veil no man hath removed. The offspring which I brought forth was the sun (E)."

The Persian magi, as we have seen, believed in two self-existent principles, a good and an evil: but if Dio- genes Laertius deserves to be credited, they held that fire, earth, and water, which they called gods, were generated of these two. It was observed in the beginning of this article, that the first object of idolatrous worship was probably the sun, and that this species of idolatry took its rise in Chaldea or Persia. But when it became the practice of eastern monarchs to conceal themselves wholly from their people, the custom, as implying dignity, was supposed to prevail as well in heaven as on earth; and Zoroaster, the reformer of the Persian theology, taught*, that "Ormuzd was as far removed from the sun as the sun is removed from the earth." According to this modification of magianism, the sun was one of the generated gods, and held the office of prime minister or vicegerent to the invisible fountain of light and good. Still, however, a self-existent principle of evil was admitted; but though he could not be destroyed or annihilated by any power, it was believed that he would at last be completely vanquished by Ormuzd and his ministers, and rendered thenceforward incapable of producing any mischief.

From this short view of polytheism, as we find it delineated by the best writers of antiquity, we think ourselves warranted to conclude, that the whole pagan world believed in but *one*, or at most *two*, SELF-EXISTENT GODS, from whom they conceived all the other divinities to have descended in a manner analogous to human generation. It appears, however, that the vulgar pagans considered each divinity as supreme and unaccountable within his own province, and therefore intitled to worship, which rested ultimately in himself. The philosophers, on the other hand, seem to have viewed the inferior gods as accountable for every part of their conduct to him who was their fire and sovereign, and to have paid to them only that inferior kind of devotion which the church of Rome pays to departed saints. The vulgar pagans were sunk in the grossest ignorance, from which statesmen, priests, and poets, exerted their utmost influence to keep them from emerging; for it was a maxim which, however absurd, was universally received, that "there were many things true in religion", which it was not convenient for the vulgar to know; and some things which, though false, it was yet expedient that they should believe." The polytheism and idolatry of the vulgar, therefore, was their misfortune rather than their fault. But the philosophers were wholly "without excuse"; because that when they knew God, they glorified him not as God, neither were thankful, but became vain in their imaginations, and their foolish heart was darkened. Professing themselves wise, they became fools, and worshipped and served the creature more than the Creator, who is God blessed for ever."

POLY-

(E) Τα οντα, και τα εσομενα, και τα γεγενητα, εγω ειμι. Τον εμον χιτωνα ουδεις απεκαλυψεν. 'Ον εγω καρπον ετερον, ηλιος ενενετο. The antiquity of this inscription is admitted by Cudworth, denied by Mosheim, and doubted by Jablonksi. The reader who wishes to know their arguments may consult Mosheim's edition of the *Intellectual System*, and Jablonksi's *Pantheon Aegyptiorum*.

Polytrichum.

POLYTRICHUM, in botany: A genus of the order of musci, belonging to the cryptogamia class of plants. The anthera is operculated, and placed upon a very small apophysis or articulation; the calyptra villous; the star of the female is on a distinct individual. There are three species; the most remarkable of which is the commune, or great golden maiden hair, frequently to be met with in the bogs and wet places of Britain. It grows in patches, the stalks erect, generally single and unbranched, from three inches to a foot, or even a yard high. The leaves are numerous, stiff, lanceolate, acute, growing round the stalk without order, and, if viewed with a microscope, appear to have their edges finely serrated. They are of a bright green when young and fresh, but reddish when dried or in decay: the filaments, or peduncles, are of a shining red, or orange colour, from two to four inches long, arising singly from the top of the stalks, and surrounded at their base with a cylindrical tubular vagina, or perichætium. The anthera, or capsule, is quadrangular, green at first, afterwards yellow, and red when ripe, having an annular pedestal, or apophysis, at its base. The operculum is flat, with a projecting point in the centre; and underneath is a whitish circular membrane, placed in the middle of the capsule's orifice, and sustained there by numerous arched threads, or cilia, connected by one end to the circumference of this membrane, and by the other fastened to the ring of the anthera. The pollen, or, as others term it, the seed, is freed from the anthera or capsule through the space between the cilia. The calyptra is twofold, an internal and external one; both which at first entirely cover and hang over the anthera. The internal one is conical, membranaceous, and smooth; the external one is composed only of tawny hairs, connected into a sort of mat, lacerated at the base, and serving like a roof of thatch to defend the other. Besides the stalks before described, there are commonly some others near at hand, which are destitute both of filaments and capsules, but are terminated with a kind of roseaceous cup, either of a bright red or yellowish colour, composed of leaves of different sizes, the outermost broad, the innermost lanceolate, growing gradually more and more fine and slender to the centre. This cup is looked upon by Linnæus as the female flower of this moss; but Haller is of opinion, that it is only the gem or origin of a new stalk, which frequently rises from its centre, and this again becomes sometimes proliferous. There are two varieties of this moss: the first has much shorter stalks than the preceding, and often branched; the leaves stiffer, erect, and more crowded; in other respects the same. The other has a stalk scarcely more than half an inch high, terminated with a cluster of linear, erect, rigid leaves, for the most part entire on the edges, and tipped each with a white hair. The filament is about an inch high, and the capsule quadrangular. The female flower, or gem, is of a bright red colour.

The first kind, when it grows long enough for the purpose, is sometimes used in England and Holland to make brooms or brushes. Of the female sort the Laplanders, when obliged to sleep in desert places, frequently make a speedy and convenient bed. Their manner of doing it is curious: Where this moss grows thick together, they mark out, with a knife, a piece of

ground, about two yards square, or of the size of a Polyxænus common blanket; then beginning at one corner, they gently sever the turf from the ground, and as the roots of the moss are closely interwoven and matted together, they by degrees strip off the whole circumscribed turf in one entire piece; afterwards they mark and draw up another piece, exactly corresponding with the first; then, shaking them both with their hands, they lay one upon the ground, with the moss uppermost, instead of a mattress, and the other over it, with the moss downwards, instead of a rug; and between them both take a comfortable nap, free from fleas and bugs, and without fear of contagious distempers. It is probable they might take the hint of making such a bed from the bear, a cohabitant of their country, which prepares his winter-quarters with a large collection of this same moss. See *MUSCI*, p. 473. and Plate CCCXXI.

POLYXÆNUS, or **POLYÆNUS**. See **POLYÆNUS**.

POLYXO, a priestess of Apollo's temple in Lemnos. She was likewise nurse to queen Hyppipyle. It was by her advice that the Lemnian women murdered all their husbands.—There was another Polyxo, a native of Argos, who married Tlepolemus son of Hercules. She followed him to Rhodes after the murder of his uncle Licymnius; and when he departed for the Trojan war with the rest of the Greek princes, she became the sole mistress of the kingdom. After the Trojan war, Helen fled from Peloponnesus to Rhodes, where Polyxo reigned. Polyxo detained her; and to punish her as being the cause of a war in which Tlepolemus had perished, she ordered her to be hanged on a tree by her female servants, disguised in the habit of Furies.

POMACEÆ, (*pomum* "an apple,") the name of the 36th order in Linnæus's Fragments of a Natural Method, the genera of which have a pulpy esculent fruit of the apple, berry, and cherry kind. See **BOTANY**, Sect. vi. p. 465.

POMATUM, an unguent generally used in dressing the hair. It is also used as a medicine. See **PHARMACY**, n° 636, &c.

POMEGRANATE. See **PUNICA**.

POMERANIA, a province of Germany, in the circle of Upper Saxony, with the title of a duchy. It is bounded on the north by the Baltic Sea, on the east by Prussia and Poland, on the south by the marquisate of Brandenburg, and on the west by the duchy of Mecklenburg; and is about 250 miles in length, and in some places 75 miles and in others 50 in breadth. It is watered by several rivers, the most considerable of which are the Oder, the Pene, the Rega, the Persant, the Wipper, the Stolp, the Lupo, and the Lobo. The air is cold; but the soil abounds in pastures, and produces corn, of which a great deal is exported. It is a flat country; containing many lakes, woods, and forests, and has several good harbours. It is divided into the Hither and Farther Pomerania, and the territories of the kings of Sweden and Prussia in this duchy are divided by the river Pene.

***POMET** (Peter), an able druggist at Paris, was born in 1658. He collected at a great expence from all countries drugs of every kind, and rendered himself celebrated by his book entitled *Histoire Generale des Drogues*

POLYTHEISM.
INDIAN GODS.

Plate CCCCXI.

The Principal IDOLS of the Saxons worshipped in Britain.

A. Vallance sc.

Pomfret *Druggus*, which is the most complete book on the subject that has yet been printed. He gave demonstrations with respect to his drugs in the king's garden, and a catalogue of all the drugs contained in his work, with a list of all the rarities of his cabinet, which he proposed to publish by subscription; but was prevented by his death, which happened in 1699, upon the very day when the patent for a pension granted him by Louis XIV. was made out.

POMFRET (John), an English poet, son of the rector of Luton in Bedfordshire, was born in 1667, and educated at Cambridge; after which he took orders, and was presented to the living of Malden in Bedfordshire. About 1703 he went to London for institution to a larger and very considerable living; but was stopped some time by Compton, then bishop of London, on account of these four lines of his poem, entitled *the Choice*:

“And as I near approach'd the verge of life,
Some kind relation (for I'd have no wife)
Should take upon him all my worldly care,
While I did for a better state prepare.”

The parentheses in these lines were so maliciously represented, that the good bishop was made to believe that Pomfret preferred a mistress to a wife. But he was soon convinced that this representation was the mere effect of malice, as Pomfret at that time was actually married. The opposition, however, which his slanderers had made to him had its effect; for, being by this obliged to stay in London longer than he intended, he caught the smallpox, and died of it, aged 35.

He published a volume of his poems in 1699, with a very modest and sensible preface. Two pieces of his were published after his death by his friend Philalethes; one intitled *Reason*, and written in 1700, when the disputes about the Trinity ran high; the other *Dies Novissima*, or the “Last Epiphany,” a Pindaric ode. His versification is not unmusical; but there is not the force in his writings which is necessary to constitute a poet. A dissenting teacher of his name, and who published some rhymes upon spiritual subjects, occasioned fanaticism to be imputed to him; but his friend Philalethes has justly cleared him from the imputation. Pomfret had a very strong mixture of devotion in him, but no fanaticism.

“*The Choice* (says Dr Johnson) exhibits a system of life adapted to common notions, and equal to common expectations; such a state as affords plenty and tranquillity, without exclusion of intellectual pleasures. Perhaps no composition in our language has been oftener perused than Pomfret's *Choice*. In his other poems there is an easy volubility; the pleasure of smooth metre is afforded to the ear, and the mind is not oppressed with ponderous, or entangled with intricate, sentiment. He pleases many; and he who pleases many must have merit.”

POMME, or **POMMETTE**, in heraldry, is a cross with one or more balls or knobs at each of the ends.

POMMEL, or **PUMMEL**, in the manege, a piece of brass or other matter at the top and in the middle of the saddle-bow.

POMMERCULLIA, in botany: A genus of the

monogynia order, belonging to the triandria class of *Pomacium* plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx is bivalved, and shaped like a top; the valvula quadrifid, and bearded on the back. The corolla has two unequal valves; the filaments three, with long pointed anthers; the style simple. The whole flower forms itself into a sharp point, and the corolla serves as a covering to the seed, which is long, clear, and smooth. There is only one species, viz. the *Dianthoides*.

POMERIUM, in Roman antiquity, was, according to Livy, that space of ground, both within and without the walls, which the augurs, at the first building of cities, solemnly consecrated, and on which no edifices were allowed to be raised. Plutarch gives this account of the ceremony of drawing the pomerium: “They dug a trench, and threw into it the first-fruits of all things, either good by custom, or necessary by nature; and every man taking a small turf of earth of the country from whence he came, they cast them in promiscuously. Then making this trench their centre, they described the city in a circle round it. After this, the founder yoking a bull and a cow together, ploughed a deep furrow, with a brazen ploughshare, round the bounds. The attendants took care that all the clods fell inwards, *i. e.* toward the city. This furrow they called *pomerium*, and built the wall upon it.”—Plutarch, in this account, is to be understood as speaking of Rome.

POMERIUM Proferre, signifies to extend or enlarge a city, which could not be done by any, but those who had taken away some part of an enemy's country in war. But this qualification was sometimes dispensed with. *Pomerium* is *quasi pone mœnia*, “behind the walls.”

POMONA, in fabulous history, the tutelar deity of orchards and fruit-trees. See **VERTUMNUS**.

POMPEII (anc. geog.), a town of Campania near Herculaneum, and destroyed along with it by the great eruption of Vesuvius in the time of Titus. See **HERCULANEUM**. It is about 15 miles from Naples, and six or seven from Portici—So much has been said and written on the discovery of this place, as makes it unnecessary for us to say much: we shall therefore only give a short extract on the subject from an anonymous work lately published, apparently of considerable merit. “On entering the city (says our author *), the first

object is a pretty square, with arcades, after the present manner of Italy. This was, as it is imagined, the quarter of the soldiers; numbers of military weapons being found here. “A narrow, but long street, with several shops on each side, is now perfectly cleansed from its rubbish, and in good preservation. Each house has a court. In some of them are paintings all fresco, principally in chiaro-scuro; and their colours not in the least injured by time. The few colours which the ancients knew were extracted only from minerals; and this may be a sufficient reason for their freshness. The street is paved with irregular stones of a foot and half or two feet long, like the Appian way.

“In discovering this city, it was at first doubted whether it were actually Pompeii: but the name inscribed over the gateway put it beyond all doubt. The

*Comparative Sketch of England and Italy, with Disquisitions on National Advantages.

Pompey skeletons found were innumerable. It is said that many had spades in their hands, endeavouring, probably at first, to clear away the torrent of ashes with which they were deluged. Indeed the satisfaction which is felt at the view of ancient habitations, is much allayed by inevitable reflections on this frightful scene of desolation, though at the distance of so many centuries.

"An ancient villa is also seen entire at a little distance from Pompeii. The house is really elegant and spacious, but only two stories high. The pavement of the chambers is composed of tessellated marble, and, when polished, displays the design perfectly well.—There is some at the museum of Portici brought from this place, which the eye would really mistake for painting. Under the house is a fine triangular cellar, of which each part is 100 feet long, well filled with amphoræ. The skeletons of 29 persons were found here, supposed to have fled to it for safety. Each house is filled with ashes: they have almost penetrated through every crevice; and it is incredible how such a volume of them could have been thrown out by Vesuvius with sufficient force to have reached so far." See Swinburne's *Travels in the Two Sicilies*, vol. 2. p. 98, &c.; Lady Miller's *Letters*, or *De La Lande*; Captain Sutherland's *Tour up the Straits, from Gibraltar to Constantinople*, p. 75. &c.; Dr Smith's *Sketch of a Tour on the Continent*, in 1786 and 1787, vol. 2. p. 118, &c.; and Watkins's *Tour through Switzerland, Italy, &c.*

POMPEY the GREAT, (Cneius Pompeius Magnus), the renowned rival of Julius Cæsar. Being defeated by him at the battle of Pharsalia, owing to the defection of his cavalry, he fled to Egypt by sea, where he was basely assassinated by order of Theodotus, prime minister to Ptolemy the Younger, then a minor,

See Rome 48 B. C.

POMPEYS (Cneius and Sextus); his sons, commanded a powerful army when they lost their illustrious father. Julius Cæsar pursued them into Spain, and defeated them at the battle of Munda, in which Cneius was slain, 45 B. C. Sextus made himself master of Sicily; but being defeated in the celebrated naval engagement at Actium by Augustus and Lepidus, he fled to Asia with only 7 ships, the remains of his fleet, which consisted of more than 350; and from thence, unable to continue the war, he was obliged to retire to Lesbos, where renewing the war by raising an army, and seizing on some considerable cities, Marcus Titius, in the interest of Marc Antony, gave him battle, defeated him, took him prisoner and basely put him to death, 35 B. C. See ROME.

Pompeii's Pillar. See ALEXANDRIA, p. 393.

POMPILUS, in ichthyology, a species of CORYPHÆNA.

POMPONATIUS (Peter), an eminent Italian philosopher, was born at Mantua in 1462. He was of so small a stature that he was little better than a dwarf; yet he possessed an exalted genius, and was considered as one of the greatest philosophers of the age in which he lived. He taught philosophy, first at Padua and afterwards at Bologna, with the highest reputation. He had frequent disputations with the celebrated Achillini, whose puzzling objections would have confounded him, had it not been for his skill in parrying them by some joke. His book *De Immortalitate Animæ*, published in 1516, made a great noise. He maintained, that the immortality of

the soul could not be proved by philosophical reasons; but solemnly declared his belief of it as an article of faith. This precaution did not, however, save him; many adversaries rose up against him, who did not scruple to treat him as an atheist; and the monks procured his book, although he wrote several apologies for it, to be burnt at Venice. His book upon Incantations was also thought very dangerous. He shows in it, that he believed nothing of magic and sorcery; and he lays a prodigious stress on occult virtues in certain men, by which they produced miraculous effects. He gives a great many examples of this; but his adversaries do not admit them to be true, or free from magic.—Paul Jovius says, that he died in 1525, in his grand climacteric. • He was three times married; and had but one daughter, to whom he left a large sum of money. He used to apply himself to the solution of difficulties so very intensely, that he frequently forgot to eat, drink, sleep, and perform the ordinary functions of nature: nay, it made him almost distracted, and a laughing-stock to every one, as he himself tells us.

POMPONIUS MELA. See MELA.

POMUM, an APPLE; a species of seed-vessel, composed of a succulent fleshy pulp; in the middle of which is generally found a membranous capsule, with a number of cells, or cavities, for containing the seeds. Seed-vessels of this kind have no external opening or valve. At the end opposite to the foot-stalk is frequently a small cavity, called by the gardeners the *eye of the fruit*, and by botanists *umbilicus*, the "navel," from its fancied resemblance to the navel in animals. Gourd, cucumber, melon, pomegranate, pear, and apple, furnish instances of the fruit or seed-vessel in question.

POND, or *FISH-Pond.* See *FISH-Ponds.*

POND, is a small pool or lake of water from whence no stream issues. In the *Transactions of the Society instituted at London for the Encouragement of Arts, Manufactures, and Commerce*, vol. viii. and printed in the year 1790, there is a short account of a machine for draining ponds without disturbing the mud. It was communicated to the society, together with a drawing and model of the machine, by Lieutenant-colonel Dansey. The model was made from the description of a machine used by a gentleman near Taunton for many years before, for supplying a cascade in his pleasure-grounds.—The colonel's regiment was then lying at Windsor; and thinking that the invention might be useful to supply the grand cascade at Virginia water, he made the model, and presented it to the king, who was graciously pleased to approve of it. In consequence of which, by his majesty's desire, a penstock on that principle was constructed from the model at one of the ponds in the neighbourhood.—The colonel thinks the machine may be useful in the hands of men of science, and applicable to silk, cotton, and other mills, where a steady and uniform velocity of water is wanted; which might be regulated at pleasure, occasioning no current to disturb the mud or fish, as the stream constantly runs from the surface. He says he has often made the experiment by the model in a tub of water.

Of this machine we have given an engraving, taken from the abovementioned Transactions; and we shall now add the description which accompanies the plate in that work.

In figure 1. A is the pipe, loaded with a rim of lead, of

of such weight as serves to sink it below the surface of the water. B is the discharging pipe, laid through the bank HI. C is the joint on which the pipe A turns its form, which is shown fig. 2. D is the ball or float, which, swimming on the surface of the pond, prevents the pipe A from descending deeper than the length of the chain by which they are connected. E is a chain winding on the windlafs F, and serving to raise the tube A above the surface of the water, when the machinery is not in use. G is a stage. HI is the bank, represented as if cut through at I, to show the tube B lying within it. K is a post to receive the tube A when lowered, and to prevent its sinking in the mud. In figure 2. A is a cast cylinder, with a plate or cheek, B, which is fastened to the timber of the tube on one side, but not on the other, as the part of the cylinder C turns in the hollow of the wooden tube when it is immersed. A piece of strong sole leather is put inside the brass-plate B, to prevent leaking.

Pond-Weed, in botany. See POTAMOGETON.

PONDICHERY, is a large town of Asia, in the peninsula on this side the Ganges, and on the coast of Coromandel. Its situation is low, and the ships anchor about a mile and a half from it; nor can the boats or canoes come nearer it than a musket-shot, on account of the breakers, so that the blacks come in flat-bottomed boats to carry the men and merchandises to the fleet. The fort is 200 paces from the sea, and very irregular; built with bricks, and covered with fine plaster, resembling white marble. The huts of the blacks lie here and there, and the walls are of bamboos mixed with the branches of trees. The French are greatly addicted to women, from whom they catch diseases that render them pale, livid, and meagre, with a frightful aspect. However, several of the French are married to a sort of Portuguese women, who are of a mixed breed, being a kind of Mulattoes. The country about it is barren, and consequently most of their provisions are brought from other places. Their trade consists of cotton-cloth, silks, pepper, saltpetre, and other merchandises that are brought from Bengal. With regard to the religion of the natives, the most numerous are the Gentoos; but there are Mahometans or Moors who hold a great many ridiculous opinions. The Gentoos are of different sects, and that of the Brahmins are priests. The custom of women burning themselves with the bodies of their dead husbands was very common, but of late much discountenanced. The slaves or servants are very numerous, and their chief food is rice. This place was taken, and the fortifications demolished, by Colonel Coote; it was restored to the French by the peace of 1763; and was retaken in the beginning of the present war with the French republic. It is 60 miles south of Fort St George. E. Long. 79. 58. N. Lat. 11. 42.

PONDICO, an island of the Archipelago, lying on the gulph of Ziton, near the coast of Negropont. It is small and uninhabited, as well as two others that lie near it.

PONG-HOU *Isses*, in the province of Fo-kien in China, form an archipelago between the port of Emouy and the island of Formosa. A Chinese garrison is kept here, with one of those mandarins who are called *literati*, whose principal employment is to watch the trad-

ing vessels which pass from China to Formosa, or from Formosa to China.

As these islands are only sand-banks or rocks, the inhabitants are obliged to import every necessary of life; neither shrubs nor bushes are seen upon them; all their ornament consists of one solitary tree. The harbour is good, and sheltered from every wind; it has from 20 to 25 feet depth of water. Although it is an uncultivated and uninhabited island, it is absolutely necessary for the preservation of Formosa, which has no port capable of receiving vessels that draw above 8 feet of water.

PONIARD, a little pointed dagger, very sharp edged; borne in the hand, or at the girdle, or hid in the pocket. The word is formed from the French *poignard*, and that from *poignée*, "handful."—The poniard was anciently of very great use; but it is now in a good measure set aside, except among assassins.—Sword and poniard were the ancient arms of duellists; and are said to continue still so among the Spaniards. The practice of sword and poniard still make a part of the exercise taught by the masters of defence.

PONS, a town of France, in Saintonge, very famous in the time of the Huguenots. It is seated on a hill, near the river Suigne, 10 miles from Saintes. W. Long. 0. 30. N. Lat. 45. 36.

PONT-DU-GARD, is a bridge of France, in Lower Languedoc, built over the river Gardon, which served for an aqueduct. It is a very remarkable and a most magnificent work, and was raised by the ancient Romans. It consists of three bridges, one above another; the uppermost of which was the aqueduct, to convey water to the city of Nîmes, which is eight miles to the south. They are altogether 192 feet high, and the uppermost 580 feet long. They are constructed between two rocks. E. Long. 4. 26. N. Lat. 43. 58.

PONTEDERIA, in botany: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the sixth order, *Enfatæ*. The corolla is monopetalous, sexfid, bilabiate; there are three stamina inserted into the top, and three into the tube of the corolla; the capsule is bilocular.

PONTEFRAC, or POMFRET, a town of the West Riding of Yorkshire in England, situated on the river Aire. It is said to take its name from a broken bridge, which is supposed to have been laid anciently over that marshy spot called the *Wash*. Here are the ruins of a noble old castle, where Richard II. was barbarously murdered, and two of Edward V.'s uncles. The collegiate chapel of St Clement, which had a dean, three prebendaries, &c. is still distinguishable in it. This town has a good market, and fairs for horses, sheep, and other cattle. It is a corporation, governed by a mayor, recorder, aldermen, and burgesses and gives title of earl to the family of Fermor. In the reign of Queen Elizabeth, 200 l. was left by George Talbot, earl of Shrewsbury, to be lent for ever, at 5 l. a time, on proper security, for three years, to the poor artificers of the town; and Thomas Wentworth, Esq: ancestor to the marquis of Rockingham, left 200 l. to the charity-school. A branch of the great Roman military way called *Erminstreet*, which passed from Lincoln to York, may be traced betwixt

Pontefract
||

fract.

Pontifex
Pont.

town and Doncaster. The adjacent country yields plenty of limestone, together with liquorice and skirrets, W. Long. 1. 5. N. Lat. 53. 42.

PONTIFEX, **PONTIFF**, or *High-priest*, a person who has the superintendence and direction of divine worship as the offering of sacrifices and other religious solemnities. The Romans had a college of pontiffs; and over these a sovereign pontiff, or pontifex maximus, instituted by Numa, whose function it was to prescribe the ceremonies each god was to be worshipped withal, compose the rituals, direct the vestals, and for a good while to perform the business of augury, till, on some superstitious occasion, he was prohibited intermeddling therewith. The office of the college of pontiffs was to assist the high-priest in giving judgment in all cases relating to religion, inquiring into the lives and manners of the inferior priests, and punishing them if they saw occasion, &c. The Jews too had their pontiffs; and among the Romanists, the pope is still styled the *sovereign pontiff*.

PONTIFICATE, is used for the state or dignity of a pontiff or high-priest; but more particularly in modern writers for the reign of a pope.

PONTIUS (Pilate.) See **PILATE**.

PONTON, or **PONTOON**, in war, a kind of flat bottomed boat, whose carcase of wood is lined within and without with tin: they serve to lay bridges over rivers for the artillery and army to march over. The French pontoons, and those of most other powers, are made of copper on the outside: though these cost more at first, yet they last much longer than those of tin; and when worn out, the copper sells nearly for as much as it cost at first; but when ours are rendered useless, they sell for nothing. Our pontoons are 21 feet long, five feet broad, and depth within two feet 1.5 inches.

PONTOON-Carriage, is made with two wheels only, and two long side-pieces, whose fore-ends are supported by a limber; and serves to carry the pontoon, boards, cross-timbers, anchors, and every other thing necessary for making a bridge.

PONTOON-Bridge, is made of pontoons slipped into the water, and placed about five or six feet asunder; each fastened with an anchor, when the river has a strong current; or to a strong rope that goes across the river, running through the rings of the pontoons. Each boat has an anchor, cable, baulks, and chests. The baulks are about five or six inches square, and 21 feet long. The chests are boards joined together by wooden bars, about three feet broad and 12 feet long. The baulks are laid across the pontoons at some distance from one another, and the chests upon them joined close; which makes a bridge in a very short time, capable of supporting any weight.

PONT ST ESPRIT, is a town of France, in Languedoc, in the diocese of Uzés. It is seated on the river Rhone, over which is one of the finest bridges in France. It is 840 yards long, and consists of 26 arches. Each

pier is pierced with an aperture, in order to facilitate the passage of the water where the river is high. The town is large, but the streets are narrow and ill-built. It formerly contained several churches and convents. It is 17 miles south of Viviers, and 55 north-east of Montpellier. E. Long. 4. 46. N. Lat. 44. 13.

PONTUS, the name of an ancient kingdom of Asia, originally a part of Cappadocia; bounded on the east by Colchis, on the west by the river Halys, on the north by the Euxine Sea, and on the south by Armenia Minor. Some derive the name of Pontus from the neighbouring sea, commonly called by the Latins *Pontus Euxinus*; others from an ancient king named *Pontus*, who imparted his name both to the country and the sea; but Bochart deduces it from the Phœnician word *botno*, signifying a filberd, as if that nut abounded remarkably in this place. But this derivation seems to be very far fetched; and the common opinion that the country derived its name from the sea, seems by far the most probable. The kingdom was divided into three parts; the first, named *Pontus Gallaticus*, extending from the river Halys to the Thermodon; the second, named *Pontus Polemoniacus*, extended from the Thermodon to the borders of *Pontus Cappadocius*; and this last extended from Pontus Polemoniacus to Colchis, having Armenia Minor and the upper stream of the Euphrates for its southern boundary.

It is commonly believed, that the first inhabitants of Pontus were descended from Tubal; but in process of time mixed with Cappadocians, Paphlagonians, and other foreign nations, besides many Greek Colonies which settled in those parts, and maintained their liberty till the time of Mithridates the Great and Pharnaces. The first king of this country whom we find mentioned in history is Artabazes, who had the crown bestowed on him by Darius (A) Hytaspes. The next was Rhodabates, who reigned in the time of Darius Nothus. After him came Mithridates, who, refusing to pay the usual tribute to the Persians, was defeated by Artaxerxes Mnemon; but a peace was soon after concluded by the mediation of Tissaphernes. Besides this, we hear nothing of him farther than that he was treacherously taken prisoner by Clearchus afterwards tyrant of Heraclea, and obliged to pay a large sum for his ransom.

Mithridates I. was succeeded by Ariobarzanes, who being appointed by Artaxerxes governor of Lydia, Ionia, and Phrygia, employed the forces that were under his care in the extending of his own dominions, and subduing those of his natural prince. The king of Persia sent one Autophrodates against him; but Ariobarzanes, having with great promises prevailed on Agefilus and Timothæus the Athenian to come to his assistance, obliged Autophrodates to retire. He then rewarded Agefilus with a great sum of money, and bestowed on Timothæus the cities of Sestos and Abydos, which he had lately taken from the Persians. He used his utmost endeavours to reconcile the Lacedæmonians and Thebans; but not being able to bring the latter to

Etymology
of the
name.

Artabazes
the first
king.

Mithridates I.

(A) This country, together, with the adjacent provinces, was in different periods under the dominion of the Assyrians, Medes, and Persians; the last of whom divided Cappadocia into satrapies or governments, and bestowed that division which was afterwards called *Pontus* on one of the ancestors of Mithridates. This regulation was effected in the reign of Darius the son of Hytaspes, and has been regarded as the date of the kingdom.

Pontus.

to any reasonable terms, he assisted the Lacedemonians with vast sums of money. The Athenians showed so much respect for this prince, that they not only made him free of their city, but granted both him and his children whatever they asked of them. He was murdered in the 28th year of his reign by one Mithridates, whom authors suppose to have been his son. This happened at the time that Alexander the Great invaded Asia, so that Pontus for a time fell under the power of the Macedonians.

4
Ariobarzanes shakes off the Macedonian yoke.

In the reign of Antigonus, Mithridates the son of Ariobarzanes shook off the Macedonian yoke; the particulars of which event are related as follow. Antigonus having dreamed that he had a field in which gold grew after the manner of corn, and that Mithridates cut it down and carried it into Pontus, began to be very jealous of him, and ordered him to be put to death privately. But Mithridates, having got notice of the king's intention, withdrew into Paphlagonia, attended only by six horsemen. Here, being joined by many others, he possessed himself of Ciniatum, a strong hold situated near mount Olgafys; from whence, as his army continually increased, he made an irruption into Cappadocia; and having driven the commanders of Antigonus from that part which borders upon Pontus, he entered his paternal kingdom, which, in spite of the utmost efforts of Antigonus, he held for the space of 26 years, and transmitted to his posterity.

Under the reigns of Mithridates III. Ariobarzanes II. and Mithridates IV. the immediate successors of Mithridates II. nothing remarkable happened. But Mithridates V. made war on the inhabitants of Sinope, a city on the coast of Paphlagonia. He made himself master of all the adjacent places; but finding the whole peninsula, on which Sinope itself stood, well fortified and garrisoned, not only by the inhabitants, but by their allies the Rhodians, he abandoned the enterprise. He afterwards proved a great friend to the Rhodians, and assisted them with money to repair the losses they had sustained by an earthquake. He entered also into a strict alliance with Antiochus the Great, who married one of his daughters named *Laodice*.

5
Pharnaces I. differs with the Romans.

After the death of Mithridates V. his son Pharnaces I. attacking the city of Sinope, unexpectedly took it by storm. On this the Rhodians sent ambassadors to Rome, complaining of the behaviour of the king of Pontus; but Pharnaces was so far from being intimidated by their threats, that he invaded the territories of Eumenes their great ally. The latter sent ambassadors to Rome, and entered into an alliance with Ariarathes king of Cappadocia. Pharnaces, in his turn, sent ambassadors to Rome, complaining of Eumenes and Ariarathes; upon which some Romans were sent into Asia to inquire into the state of matters. These found Eumenes and his associates willing to accommodate the difference, but Pharnaces in a quite opposite disposition, which they accordingly reported at Rome.

6
Concludes a most disadvantageous peace,

In the mean time a war was commenced between Eumenes and Pharnaces; but the latter, being disappointed of assistance from Seleucus king of Syria, whom the Romans would not allow to join him, was at last forced to sue for peace; which was granted him upon the following conditions: That he should forthwith withdraw his forces from Galatia, and disannul all engagements and alliances with the inhabitants of that

country; that he should in like manner evacuate Paphlagonia, and send back such as he had from thence carried into slavery; that he should restore to Ariarathes all the places which he had taken during the war, the hostages of both kings, all their prisoners without ransom, and moreover should deliver up to them such of their subjects as from the first breaking out of the war had fled to him; that he should return to Morzias, a petty king in these parts, and to Ariarathes, 900 talents which he had seized in the war, and pay down 300 more to Eumenes as a fine for invading his dominions without provocation. Mithridates, king of Armenia, having in this war joined Pharnaces, was, by the articles of the treaty, obliged to pay 300 talents to Ariarathes for having assisted his enemy contrary to an alliance at that time subsisting between them. Soon after Pharnaces died, and left the kingdom to his son Mithridates VI. more weakened by this peace than by the most destructive war.

The new king entered into an alliance with the Romans, and proved such a faithful friend, that he was rewarded by the senate with Phrygia Major, and honoured with the title of the friend and ally of the people of Rome. After a long and prosperous reign, he was murdered by some of his intimate acquaintance, and was succeeded by his son Mithridates VII. surnamed the *Great*.

The new prince, though not exceeding 13 years of age, began his reign with most inhuman acts of cruelty to his mother and nearest relations. His father, by his last will, had appointed him and his mother joint heirs to the kingdom; but he, claiming the whole, threw her into prison, where she soon died through the hard usage she met with. Those to whom the care of his education was committed, observing him to be of a cruel and unruly temper, made various attempts on his life, but could never effect their design, as the king was always on his guard, and armed, in that tender age, against all kind of treachery, without showing the least diffidence.

In his youth Mithridates took care to inure himself to hardships, passing whole months in the open air, employed in the exercise of hunting, and often taking his rest amidst the frozen snow. When he came of age, he married his sister named *Laodice*, by whom he had a son named *Pharnaces*. After this he took a journey through many different kingdoms of Asia, having nothing less in view than the whole continent. He learned their different languages, of which he is said to have spoken 22; took an estimate of their strength; and above all viewed narrowly their strong holds and fortified towns. In this journey he spent three years; during which time, a report being spread abroad that he was dead, his wife Laodice had a criminal conversation with one of the lords of her court, and had a son by him. When her husband returned, she presented him with a poisoned bowl; but Mithridates had accustomed himself to take poison from his infancy, so that it had now no other effect than to hasten the destruction of his wife, which very soon took place, together with all those who had been any way accessory to her disloyalty and incontinence.

The king now began to put in execution his schemes of conquest. However, he certainly took the wrong method by attacking first those nations which were im-

mediately under the protection of Rome, and thus at once provoking that powerful people to fall upon him. He began with Paphlagonia, which the Romans had declared a free state. This country he easily reduced, and divided between himself and Nicomedes king of Bithynia, at that time his ally. The Romans remonstrated; but Mithridates, instead of paying any regard to their remonstrances, invaded Galatia, which was immediately under their protection. This he also reduced, and then turned his eyes on Cappadocia. But as the kingdom of Cappadocia was at that time held by Ariarathes, who was a great favourite of the Romans, and married to the sister of Mithridates, the latter hired an assassin to dispatch Ariarathes, after which he thought he might succeed better in his designs. After the death of Ariarathes, Cappadocia was invaded by Nicomedes king of Bithynia, who drove out the son, and married the widow of Ariarathes. This gave Mithridates a plausible pretence for invading Cappadocia; which he instantly did, and drove Nicomedes quite out of the country. Thus Mithridates gained considerable reputation, not only as a warrior, but as a just and good-natured prince; for as it was not known that he had any hand in the murder of Ariarathes, every one imagined that he had undertaken the war against Nicomedes, merely to revenge the quarrel of his nephew, and to restore him to his right. To keep up the farce a little longer, Mithridates actually withdrew his troops out of the country, and left the young prince master of the kingdom. In a short time, however, he began to press the young king of Cappadocia to recal the assassin Gordius, who had murdered his father: but this the king of Cappadocia refused with indignation; and Mithridates, being determined on a quarrel at all events, took the field with an army of 80,000 foot, 10,000 horse, and 600 chariots armed with scythes. With this force he imagined he should carry all before him: but finding the king of Cappadocia ready to oppose him with a force no way inferior to his own, he had recourse to treachery; and inviting his nephew to a conference, stabbed him, in the sight of both armies, with a dagger which he had concealed in the plaits of his garment. This barbarous and unexpected piece of treachery had such an effect on the Cappadocians that they threw down their arms, and suffered Mithridates, without opposition, to seize upon all their strong holds. He resigned the kingdom, however, to his son, a child of eight years of age. The care of the young prince, and of the whole kingdom, he committed to Gordius; but the Cappadocians, disdaining to be ruled by such a scandalous assassin, placed on the throne the brother of Ariarathes, who had kept himself concealed in some part of Asia. His reign, however, was of short duration; he being soon after driven out by Mithridates, and the Cappadocians again reduced. The unhappy prince died of grief; and in him ended the family of Pharnaces, who had ruled Cappadocia from the time of Cyrus the Great.

Nicomedes, king of Bythynia, being now greatly afraid of Mithridates, and supposing that his own dominions would next fall a prey to the ambitious conqueror, suborned a youth of a comely and majestic aspect to pretend that he was a third son of Ariarathes, to go to Rome, and demand the kingdom of Cappadocia as his just right. He was received by the senate with the

greatest kindness, and Laodice the wife of Nicomedes even confirmed the deceit by her oath. But in the mean time Mithridates having got intelligence of the plot, sent notice of it by Gordius to the Romans, so that the imposture was soon known at Rome also. The consequence of this was, that the senate commanded Mithridates to relinquish Cappadocia, and Nicomedes that part of Paphlagonia which he possessed; declaring both these countries free. The Cappadocians protested that they could not live without a king; upon which they were allowed to choose one of their own nation. Mithridates used all his interest in favour of Gordius; but he being excluded by the Romans, one Ariobarzanes was chosen by the majority of votes.

To enforce this election, Sylla was sent into Cappadocia. He had the character of an ambassador, but the real intent of his coming was to disappoint the ambitious designs of Mithridates. With an handful of forces he defeated a numerous army of Cappadocians and Armenians commanded by Gordius, and settled Ariobarzanes on the throne. But no sooner was Sylla gone than Mithridates stirred up Tigranes king of Armenia against Ariobarzanes, who, without making any resistance, fled to Rome, and Tigranes restored the kingdom to Ariarathes the son of Mithridates. At the same time died the king of Bithynia; upon which Mithridates immediately invaded that country, and drove out Nicomedes the natural son of the late king. But the expelled prince, having fled to Rome, and being assisted by that powerful republic, the king of Pontus was soon obliged to abandon Bithynia and Cappadocia.

The Romans now being exceedingly jealous of the power and ambition of Mithridates, resolved to humble him at all events. For this purpose they sent ambassadors to the kings of Bithynia and Cappadocia, desiring them to make frequent inroads into the neighbouring territories of Mithridates, and behave there as they pleased; assuring them of powerful assistance in case they should have occasion. Ariobarzanes could not by any means be induced to provoke so powerful a neighbour; but Nicomedes being induced, partly by promises and partly by menaces, to comply, entered Pontus, where he laid waste whole provinces with fire and sword. Mithridates complained to the Roman legates: but they replied, that he himself had been the first aggressor; that Nicomedes had only paid him in his own coin, and that they would not allow him to hurt their friend and ally. Upon this Mithridates, entering Cappadocia with a numerous army, put to flight the united forces of Ariobarzanes and Altinius the Roman legate; thus making himself once more master of this kingdom. In the mean time he sent ambassadors to Rome, complaining of the proceedings of Nicomedes: but his ambassadors met with a very indifferent reception; being enjoined to tell their master, that he must either restore the kingdom of Cappadocia to Ariobarzanes, and make peace with Nicomedes, or be accounted an enemy of the Roman people. With this answer they were commanded to depart the city that very day, and told that no more ambassadors could be admitted till such time as their commands were obeyed.

In the mean time both parties prepared for war. The Roman legates in Asia drew together all the forces they could muster in Bithynia, Cappadocia, Paphlagonia, and Galatia; and, being joined by Cassius governor

of Asia, took the field against Mithridates in the year 19 B. C. They divided their army into several small bodies: Cassius encamped on the confines of Bithynia and Galatia; Manius Aquilius with his body possessed himself of the avenues leading from Pontus into Bithynia; Quintus Oppius secured the entrance into Cappadocia; and the admirals Minucius Rufus and C. Popilius lay with a fleet of 300 sail at Byzantium, to prevent the enemy from entering the Euxine sea. Each of the generals had under his command an army of 40,000 men; besides a body of 50,000 foot and 6000 horse brought to their assistance by Nicomedes.

On the other hand, Mithridates having invited several of the neighbouring nations to join him, collected an army of 250,000 foot, 50,000 horse, 130 chariots armed with scythes; besides 300 ships and 100 galleys. Part of this force he detached against Nicomedes; and utterly defeated him, though much superior in number, as he was taking possession of an advantageous post by order of Cassius. Another part he detached against Manius Aquilius, whom he also defeated with the loss of 10,000 killed on the spot, and 3000 taken prisoners; on which the other Roman generals abandoned their posts, the fleet also dispersed, and most of the ships were either taken or sunk by the admirals of Mithridates.

Asia-Mi-
nor.

The king of Pontus now resolving to improve the opportunity, and drive the Romans entirely out of Asia, over-ran all Phrygia, Mysia, Asia Proper, Caria, Lycia, Pamphylia, Paphlagonia, and Bithynia, with all the rest of the countries which had either belonged to or sided with the Romans, as far as Ionia. He was received everywhere with the greatest demonstrations of joy; the inhabitants flocking to him in white garments, and calling him their father, deliverer, their god, and the great and sole lord of all Asia. What gained him the affections of the people was his kind usage to the prisoners he had taken in the two engagements abovementioned; for he not only sent them all home without ransom, but furnished them with plenty of provisions, and money sufficient to defray their expences by the way. Ambassadors flocked to him from all parts; and among others, from Laodicea on the Lycos, to whom the king promised his protection, provided they delivered up to him Q. Oppius governor of Pamphylia, who had fled thither for protection. This request was readily complied with; Oppius was sent to him in chains, with lictors walking before him in derision of the Roman pride and ostentation. Mithridates was overjoyed to see a Roman general and proconsul in his power; and his joy was soon after increased by the arrival of Manius Aquilius, whom the Lesbians, revolting from the Romans, sent to him in fetters, together with many other Romans of distinction who had taken shelter among them. As he had been the chief author of the war, Mithridates led him about with him wherever he went, either bound on an ass, or on foot coupled with one Bastarnes a public malefactor, compelling him to proclaim to the crowds who came to see him, that he was Manius Aquilius the Roman legate. When he came to Pergamus, he caused him first to be publicly whipped, then to be put on the rack, and lastly melted gold to be poured down his throat.

20
Puts Aqi-
lius to
death.

Mithridates being now looked upon as invincible, all the free cities of Asia received him as their sovereign,

contributing large sums towards the defraying the expences of the war; by which means he became possessed of such treasures as enabled him to keep several numerous armies in the field for five years without levying any taxes on his subjects. As many Roman citizens were dispersed in the provinces which Mithridates had subdued, he considered these as so many spies who would not fail to send an account of his proceedings to Rome: for which reason he resolved to cut them all off at once by a general massacre; which barbarous policy, it is said, had never been heard of till his time, but has been since practised by other nations. He dispatched private letters to all the governors and magistrates of the cities where the Romans resided, enjoining them on pain of death, and the entire destruction of their country, to cause all the Italian race, women and children not excepted, to be murdered on the 30th day from the date of his letters, and to let their bodies lie unburied in the open fields. One moiety of their goods was to be forfeited to the king, and the other bestowed as a reward on the assassins. Whatever slave murdered his master was to receive his liberty, and one half of the debt was to be remitted to the debtor that should kill his creditor. Whoever concealed an Italian, under any pretence whatever, was to be punished with immediate death. On the fatal day, all the gates of the cities being shut, and the avenues kept with soldiers, the king's orders were proclaimed, which caused an universal horror, not only among the unhappy victims themselves, but among those who had any feelings of humanity, at seeing themselves obliged either to betray and murder their innocent guests, friends, and relations, or to become liable to a cruel death. However, as most of the Asiatics bore a mortal hatred to the Romans, and were more animated by the promise of an ample reward, the orders were without delay put in execution. The inhabitants of Ephesus, where Mithridates then resided, dragged such as had taken sanctuary in the temple of Diana from the very statue of the goddess, and put them to the sword. The Pergamenians discharged showers of darts upon them as they embraced the statues in the temple of Esculapius. At Adramyttium in Mysia many were murdered in the water, while they were attempting, with their children on their backs, to swim over to the island of Lesbos. The Caunians, who not long before had been delivered from the yoke of the Rhodians, and restored to their ancient privileges, excelled all the rest in cruelty: for, as if they had apostatised from human nature, they took pleasure in tormenting and butchering the innocent children before their mothers' eyes; some of them running distracted, and others dying with grief at a sight which nature could not bear. The Trallians were the only people on the continent who would not have the cruelty to imbrue their hands in the blood of the innocent Italians. However, as the king's orders were peremptory, they hired one Theophilus a Paphlagonian to dispatch the few Romans that lived among them. He, having shut them all up together in the temple of Concord, first cut off their hands as they embraced the statues of the gods, and then hacked them in pieces. Many Romans were saved on the floating islands of Lydia called *Calaminæ*, where they concealed themselves till such time as they found an opportunity of escaping out of Asia. Never-

Reduces
the iſland
of Cos.

Mithridates having now got rid of thoſe whom he was in dread of on the continent, embarked great part of his forces in order to reduce the iſlands of the Archipelago. At Cos he was gladly received, and had delivered up to him the young Alexander, ſon of Alexander king of Egypt, who being driven out of that country, was killed by Chareas a ſea-captain as he was retiring in a ſmall veſſel to Cyprus. With the young prince, they put into the king's hands vaſt ſums of money, with all the golden veſſels and jewels, to an immense value, which his grandmother Cleopatra had been amafſing for many years. To the young prince Mithridates gave an education ſuitable for a king's ſon, but kept the treaſures to himſelf. Here likewiſe he found 800 talents in ready money, which, at the firſt breaking out of the war, had been depoſited by the Jews of Aſia, and were deſigned for the temple of Jeruſalem.

23
But fails in
his attempt
upon
Rhodes.

From Cos Mithridates ſteered his courſe for Rhodes, where at that time all the Romans who had eſcaped the maſſacre abovementioned found a ſanctuary, and, amongſt others, L. Caſſius the proconſul. The Rhodians, however, being very expert in maritime affairs, Mithridates did not think proper to venture an engagement. As the enemy's fleet advanced, therefore, he retired; but ſix of the Rhodian ſhips coming up with 25 of his, a ſharp action enſued, in which the Rhodians ſunk two of the king's ſhips, and put the reſt to flight. In this encounter, though Mithridates had never ſeen a ſea-fight before, he behaved with great intrepidity; but one of the ſhips of his own ſquadron falling foul of that which carried him, he was very near being taken priſoner. From this time forth he abhorred the ſea, and took an averſion to all the Chians, becauſe the pilot of that ſhip was a Chian. However, he again appeared before the iſland; but was forced anew to leave it with diſgrace, and to give over all thoughts of reducing it.

24
His generals
reduce
all Greece.

Mithridates now retired into Aſia, with a deſign to ſettle the civil government of the countries which he had conquered, committing the care of the war to his generals. Archelaus, his generaliſſimo, was ſent into Greece with an army of 120,000 men; where, by treachery, he made himſelf maſter of Athens, and either put to the ſword or ſent to Mithridates all thoſe who favoured or were ſuſpected to favour the Romans. From Athens he diſpatched parties to reduce the neighbouring caſtles and the iſland of Delos, which they did accordingly; but Orobius, a Roman general, hearing that the enemy kept no guards, but paſſed their time in carouſing and debauchery, fell upon them unexpectedly, and cut off the whole party, except Apellicon the commander.

In the mean time, Metrophanes, another of the king's generals, entering Eubœa, laid waſte the whole country, exerting his rage chiefly againſt the cities of Demetrias and Magnesia, which reſuſed to open their gates to him. But as he was ſailing off with a great booty, Bryttius, the prætor or governor of Macedonia, coming up with him, ſunk ſome of his ſhips, and took others, putting all the priſoners to the ſword. Mithridates, upon the news of this loſs, ſent his ſon Ariarathes with a powerful army to invade Macedonia; which he ſoon reduced, to-

gether with the kingdom of Thrace, driving the Romans everywhere before him. The generals whom he ſent into other quarters were no leſs ſucceſſful; ſo that Mithridates had, according to Aulus Gellius, 25, different nations who paid him homage. The ſame author adds, that he was ſkilled in every one of their various languages, ſo that he could converſe with the natives without an interpreter. Among theſe nations we find the Rhoxani, now the Ruſſians or Muſcovites whom Deiphontus, one of the king's generals, brought under ſubjection, after having ſlain in an engagement 50,000 of the barbarians.

All this time the Romans had been too much taken up with their own domeſtic quarrels to take ſuch effectual meaſures as they otherwiſe would have done for checking the progreſs of Mithridates. But at laſt, having received certain advice that the king deſigned to invade Italy, and that he had even been ſolicited to do ſo by ſome of the revolted Italians, they ſent againſt him Lucius Sylla, who had already given ſufficient proofs of his courage, conduct, and experience in war. He had with him only five legions and a few cohorts. With this inconfiderable force he landed in Attica, and in a ſhort time made himſelf maſter of the capital; Archelaus not daring, or, according to others, through treachery, not caring, to engage him. As Sylla had but a few frigates, he ſent Lucullus to the iſland of Rhodes, with orders to the Rhodians to join him with their fleet. The undertaking was very dangerous, as the king's fleet in a manner covered the ſea. However, Lucullus, deſpiſing all danger, ventured out, and ſailed, without meeting with any perverſe accident, to Syria, Egypt, Libya, and Cyprus; from whence he returned with ſuch ſupplies of ſhips and experienced mariners, as enabled Sylla, after their conjunction with the Rhodians, to act offeſſively by ſea alſo. Archelaus now diſpatched meſſengers to Taxiles, who commanded in Thrace and Macedon, deſiring him to join him with all his forces; which the other readily did, and between both muſtered an army of 120,000 men. Sylla met them near Cheronæa with only 15,000 foot and 1500 horſe; but gave them a moſt dreadful overthrow, no fewer than 110,000 of the Aſiatics being ſlaughtered, while the Romans loſt only 12 men.

This ſucceſs having raiſed envy and jealousy againſt Sylla in Rome, the ſenate ſent Lucius Valerius Flaccus, the conſul of that year, with two legions into Aſia, in appearance to attack Mithridates on that ſide, but with private inſtructions to fall upon Sylla himſelf, if they found him diſaffected to the ſenate. As Flaccus was a man of no experience in war, C. Fimbria, a ſenator of great reputation among the ſoldiery, was appointed to attend him with the character of legate and lieutenant-general. Sylla was at that time in Bœotia; but, hearing what had happened at Rome, he marched with all expedition into Theſſaly, with a deſign to meet Flaccus, who, he expected, was to land in that province. But no ſooner had he left Bœotia, than the country was over-run by an army of Aſiatics, under the command of Dorylaus the king's chief favourite. On this advice Sylla returned into Bœotia, where he gained two ſignal victories, which put an end to the war in Greece. In the firſt of theſe Dorylaus loſt 150,000 of his men according to ſome, or 200,000 according to others; and in the next all the reſt. In this laſt engagement 20,000

Pontus.

20,000 were driven into a river, where they all perished; an equal number were pursued into a marsh, and entirely cut off; the rest were killed in the heat of battle, the Romans giving no quarter to men who had treated their fellow-citizens after such a barbarous manner in Asia. Plutarch tells us, that the marshes were dyed with blood; that the course of the river was stopped by the dead bodies; and that even in his time, that is, near 200 years after, a great number of bows, helmets, coats of mail, and swords were found buried in the mud. Archelaus, who had joined Dorylaeus with a body of 10,000 men a few days before the battle, lay three days stripped among the slain till he found a small vessel which carried him to Eubœa, where he gathered what forces he could, but was never again able to appear in the field. Indeed Livy tells us, that Archelaus betrayed the king's cause; and Aurelius Victor, that the king's fleet was intercepted by Sylla through the treachery of Archelaus: adding, that there was a good understanding between the two commanders, as was plain from Sylla's bestowing upon Archelaus 10,000 acres of land near the city of Chalcis in Eubœa. Strabo also informs us, that Archelaus was afterwards greatly esteemed and caressed by Sylla and the senate; but Sylla himself in his commentaries, and Dio, endeavour to clear Archelaus from all suspicion of treachery.

In the mean time, Sylla having given up Bœotia to be plundered by his soldiers, marched into Thessaly, where he took up his winter-quarters, caused his old ships to be refitted and several new ones built, in order to pass over into Asia in the beginning of the spring, that he might drive from thence not only Mithridates, but his rival Flaccus also, whom the senate, out of opposition to him, had appointed governor of that province. But before he arrived, some differences having arisen between Flaccus and Fimbria, the latter was by the consul deprived of his command. Upon this Fimbria, having gained over the soldiery to his side, made war on the consul, took him prisoner, put him to death, and assumed the command of all the Roman forces in Asia. In this station he behaved with the greatest cruelty, insomuch that his name became more odious than even that of Mithradates itself. This hatred the king of Pontus endeavoured to improve to his own advantage; and therefore commanded his son, by name also *Mithridates*, to join Taxiles, Diophantes, and Menander, three of his most experienced commanders, to return at the head of a numerous army into Asia; not doubting but the inhabitants, thus harassed by Fimbria, would shake off the Roman yoke when they saw such a powerful army in the field ready to protect them. But Fimbria, distrusting the Asiatics, marched out to meet the enemy, and offered them battle before they entered the province. As the king's army was greatly superior to the Romans in number, the latter suffered greatly in the engagement, but held out till night parted them, when they withdrew to the opposite side of a river, which was at a small distance from the field of battle. Here they designed to intrench themselves: but in the mean time a violent storm arising, Fimbria laid hold of that opportunity to repass the river and surprise the enemy: of whom he made such havock as they lay in their tents, that only the commanders and some few troops of horse escaped. Among these was the king's son; who, attended by a few horse, got safe

to Pergamus, where his father resided. But Fimbria, pursuing him night and day without intermission, entered Pergamus sword in hand; and hearing that both Mithridates and his son had fled from thence a few hours before, he continued his pursuit, and would have taken the king himself, had he not entered Pitane with a considerable body of horse. The place was closely invested by Fimbria; but as he had no ships to block it up by sea also, he sent a messenger to Lucullus, who commanded the Roman navy in Asia, intreating him, as he tendered the welfare of the republic, to make what haste he could to Pitane, and assist him in taking the most inveterate enemy the Romans had. But Lucullus, preferring the gratification of a private pique to the good of his country, refused to come: and thus allowed the fleet of Mithridates to carry him in safety to Mitylene.

Soon after the king's departure, Fimbria took Pitane by storm, and reduced most of the cities of Asia, particularly Troy, which he also took by storm in eleven days, and put most of the inhabitants to the sword, because they had sent an embassy to Sylla, offering to submit to him rather than to Fimbria.—To add to the misfortunes of Mithridates, his fleet was entirely defeated in two engagements by Lucullus; so that he began to be weary of the war, and therefore desired Archelaus to conclude a peace upon as honourable terms as he could. The king himself had afterwards also a conference with Sylla, and a peace was concluded in 85 B. C. on the following terms, viz. That Mithridates should relinquish all his conquests, and content himself with his paternal dominions, which were confined within the limits of Pontus: that he should immediately resign Bithynia to Nicomedes, and Cappadocia to Ariobarzanes, and release without ransom all the prisoners he had taken during the war: that he should pay to the Romans 2000, or as others will have it 3000, talents, and deliver up to Sylla 80 ships with all their arms and ammunition, and 500 archers; and lastly, that he should not molest such cities or persons as had during the war revolted from him and sided with the Romans.

Sylla, having thus concluded the war with great glory to himself and advantage to the republic, turned his army against Fimbria; but the latter, finding himself in no condition to oppose his rival by force, had recourse to treachery, and attempted to get Sylla murdered. The plot miscarried, and Fimbria put an end to his own life; upon which Sylla, having now an uncontrouled power in Asia, declared the Chians, Rhodians, Lycians, Magnesians, and Trojans, free, and friends of the people of Rome, by way of reward for their having sided with the Romans: but on the other cities he laid heavy fines; condemning them in one year to pay 20,000 talents, and quartering his soldiers in the houses of those who had shown disaffection to the Romans. Each private man was to receive of his landlord 16 drachmas a-day, and each officer 50; and besides, both were to be supplied with provisions, not only for themselves, but for such of their friends as they thought proper to invite. By these impositions most of the people of Asia were reduced to beggary; especially the inhabitants of Ephesus, who had above all others shown their hatred to the Romans. Sylla then, having collected immense treasure, set sail for Italy; leaving behind him Lucullus

Fimbria puts Flaccus to death.

30
Defeats the forces of Mithridates.

31
And besieges the king.

Pontus. with the character of *quaestor*, and Muræna with that of *praetor*.

The two legions which Fimbria had commanded were given to Muræna, because Sylla suspected them of an inclination to the faction of Marius, whose party he was going to crush at Rome.

34
Mithridates reduces the nations which had revolted from him.

Mithridates in the mean time no sooner returned into Pontus, than he set about the reduction of those nations which had revolted from him during the war. He began with the Colchi; who immediately submitted, upon condition that Mithridates would give his son for a king over them. This was complied with; but the old king had thenceforward a jealousy of his son, and therefore first imprisoned and then put him to death. Soon after this, the king having made great preparations under pretence of reducing the Bosphori, a warlike nation who had revolted from him, the Romans began to be jealous. Their jealousy was further increased by Archelaus, who fled to them, and assured them that the preparations of Mithridates were not at all designed against the Bosphori. On hearing this, Muræna invaded Pontus without any farther provocation. The king put him in mind of the articles of peace concluded with Sylla: but Muræna replied that he knew of no such articles; for Sylla had set nothing down in writing, but contented himself with the execution of what had been agreed upon. Having given this answer, the Roman general began to lay waste and plunder the country, without sparing even the treasures or temples consecrated to the gods. Having put all to fire and sword on the frontiers of Pontus towards Cappadocia, he passed the river Halys, and on that side possessed himself of 400 villages without opposition; for Mithridates was unwilling to commit any hostilities before the return of an ambassador whom he had sent to Rome to complain of the conduct of Muræna. At last the ambassador returned, and with him one Callidius; who, in public assembly, commanded Muræna to forbear molesting a friend and ally of the Roman people; but afterwards, calling him aside, he had a private conference with him, in which it is supposed, as he brought no decree of the senate, that he encouraged him to pursue the war. Whatever might be in this, it is certain that Muræna still continued to practise the same hostilities, and even made an attempt on Sinope, where the king resided and the royal treasures were kept. But as the town was well fortified, he was forced to retire with some loss.

35
The Romans invade his territories without provocation.

In the mean time Mithridates himself taking the field, appeared at the head of a powerful army, drove the Romans out of their camp, and forced them with great slaughter to save themselves over the mountains into Phrygia; which sudden victory again induced many cities to join Mithridates, and gave him an opportunity once more of driving the Romans out of Cappadocia.

36
But are defeated.

In the mean time, Sylla, being created dictator at Rome, sent a messenger to Muræna, charging him in his name not to molest Mithridates, whom he had honoured with the title of a friend and ally of Rome. Muræna did not think proper to disregard this message; and therefore immediately abandoned all the places he had seized, and Mithridates again renounced Cappadocia, giving his own son as an hostage of his fidelity. Being then at leisure to pursue his other plans, Mithridates fell upon the Bosphori; and, having soon subdued them, appointed Machares one of his sons king of the

country. But leading his army from thence against the Achæans, a people bordering on the Colchi, and originally descended from the Greeks, who returning from Troy had mistaken their way into Greece and settled there, he was defeated with the loss of three-fourths of his men. On his return to Pontus, however, he recruited his army, and made vast preparations to invade them anew; but in the mean time, hearing of Sylla's death, he came to the imprudent resolution of entering into a second war with the Romans. Having therefore induced his son-in-law Tigranes, king of Armenia, to invade Cappadocia, he himself entered Paphlagonia at the head of 120,000 foot disciplined after the Roman manner, 16,000 horse, and 100 chariots armed with scythes. This country readily submitted; after which the king marched into Bithynia, which also submitted without opposition; the province of Asia followed the example of the rest; for these countries being oppressed with exorbitant taxes, looked upon him as their deliverer. In entering the cities of Asia, he caused M. Marius or Varius, whom Sertorius had sent him out of Spain to discipline his troops, walk before him with the ensigns of consular dignity as if he was the chief magistrate; the king following as one of his attendants. He made several cities free; but at the same time acquainted the inhabitants, that they were indebted to Sertorius for their liberty; and thus, by the connivance of that general, many cities revolted from the Romans without knowing that they had done so. But in the mean time Julius Cæsar, being at that time at Rhodes, whither he had gone to study oratory, and hearing what havoc the king's officers made in the adjacent countries, he collected what troops he could, and falling unexpectedly upon them, drove them quite out of the province of Asia.

Pontus.
37
Engages in a new war with the Romans.

The Roman senate, now finding a war unavoidable, appointed Lucullus to manage it. The other consul Cotta, having solicited an employment in this war, was sent with a fleet to guard the Propontis and defend Bithynia. Lucullus having raised one legion in Italy, passed over with it into Asia, where he was joined by four others, two of which, as they had served under Fimbria, proved at first very mutinous and refractory; nor were the other two much better, having been immersed in the Asiatic luxuries. The disciplining of these troops took up a considerable time, which was prejudicial to the Roman affairs; for almost all the Asiatics were ready to revolt, and Mithridates was making the greatest preparations. One of his armies was ordered to march into Cappadocia, under the command of Diophantus Matharus, in order to oppose Lucullus if he should attempt to enter Pontus on that side; another, commanded by Mithridates in person, consisted of 150,000 foot, 12,000 horse, and 100 chariots armed with scythes; a third army, commanded by Marius and Eumachus, two generals of great experience in war, was encamped in the neighbourhood of Heraclea in Pontus.

38
Lucullus and Cotta sent against him.

The beginning of the war proved favourable to Mithridates. Cotta being desired by Lucullus to keep his fleet within the harbour, as being inferior to that of Mithridates, resolved to take the first opportunity of fighting the king by land, not doubting of an easy victory. Having for this purpose collected all the forces he could, Cotta dispatched his legate, P. Rutilius, with a con-

39
Mithridates is at first successful.

Pontus.

a considerable body to observe the motions of the enemy. This commander being met by Marius and Eumachus, an engagement ensued, in which the Romans were defeated, and the greatest part of them, together with their commander, cut in pieces. The same misfortune befel several other officers of distinction sent out to oppose Mithridates; who, being elated with success, ordered his admiral to sail into the very harbour, and fire the Roman fleet. This was accordingly performed without the least opposition from Cotta; and 60 ships were taken, sunk, or burnt, on that occasion.

These victories having increased the rebellious disposition of the Asiatics, made Lucullus hasten his march in order to stop the progress of the enemy. But finding the king's army much more numerous than he expected, he thought proper to decline an engagement. However, several skirmishes happened, in which the Romans had always so much the advantage, that they became impatient for a general engagement. But Lucullus did not at this time choose to run so great a risk; and therefore Mithridates, seeing he could not force the Romans to a battle, decamped in the night-time, and by day-break reached Cyzicum, a most important city, and greatly attached to the Romans. Lucullus pursued him; and, falling on his rear, killed 10,000, and took 13,000 prisoners. After this, the Roman general, by a manœuvre, gained an important pass, which enabled him to cut off all communication between the army of Mithridates and the neighbouring country. The king, seeing himself thus in danger of famine, redoubled his efforts to gain the city; but finding that he could not batter down the walls, he resolved to undermine them. In this also he was unsuccessful; the besieged sunk countermines, and had very near taken the king himself in one of his own mines. In the mean time, winter coming on, the army of Mithridates was so distressed for want of provisions, that many died of hunger, while the survivors were forced to feed on the flesh of their dead companions. The famine was followed by a plague; which destroyed such numbers, that Mithridates was obliged to think of a retreat; and even this was become very dangerous. However, he laid hold of the opportunity when Lucullus went away to besiege a neighbouring castle, and sent off the greatest part of his cavalry in the night; ordering them not to halt till they were out of the reach of the enemy. But Lucullus having got intelligence of their march, suddenly returned, and pursued them so close, that he came up with them as they were passing a river, took 600 horse, all their beasts of burden, 15,000 men, and put the rest to the sword. On his return he fell in with Aristonicus the king's admiral, whom he took, just as he was ready to sail with a large sum of money designed to bribe the Roman army. In the mean time Mithridates, finding himself reduced to the last extremity, embarked in the night-time with the greatest part of the forces, while Marius and Eumachus, with 30,000 men, made the best of their way to Lampascus. But being closely pursued by the Romans, they were overtaken at the river Cēfopus, which at that time was not fordable, by reason of its having been swelled by heavy rains. Twenty thousand were killed on the spot; nor could a single man have escaped, had not the Asiatics scattered great quantities of gold and silver in

VOL. XV.

the way, that the march of the Romans might be retarded by their stopping to gather it up. Lucullus on his return entered Cyzicum amidst the acclamations of the citizens; who afterwards instituted public sports in honour of him, which they called *Luculla*. The city was declared free and all the privileges, exemptions, and immunities, bestowed upon the citizens which were enjoyed by the inhabitants of Rome itself.

From Cyzicum, Lucullus marched along the coast of the Hellespont till he came to Troas; where he equipped his fleet, and put to sea in quest of Marius, Alexander, and Dionysius, three of the king's generals, who had a fleet of 50 ships, with 10,000 land forces on board. Lucullus came up with them near the island of Lemnos, took 32 of their ships, and put a great number of their land-forces to the sword. The day after the engagement the three generals were discovered in a cave where they had concealed themselves, and dragged from thence to Lucullus; who after having severely upbraided Marius for fighting against his country, caused him to be put to death. Alexander and Dionysius were reserved for the triumph; but the latter poisoned himself to avoid that disgrace. Lucullus then steered his course for Bithynia, on receiving intelligence that Mithridates had appeared with his fleet on those coasts: but the king having notice of his approach, made what haste he could to gain Pontus, and arrived at Heraclea on board a pirate named *Selemus*; with whom he was obliged to trust himself, his fleet being dispersed by a violent storm, and the ship that carried him cast away.

In the mean time Mithridates was no less unfortunate by land than by sea. Triarius, one of the officers of Lucullus, reduced the cities of Apamea, Prusa, Prusias, and Nicæa. From thence he marched with all expedition to Nicomedia, where the king himself was, and near which place Cotta lay encamped. But before the two armies could be joined, Mithridates escaped, first to Heraclea, which was betrayed to him, and from thence to Sinope. Nor was Lucullus himself all this time inactive. Having reduced all Paphlagonia and Bithynia, he marched through Cappadocia, and joined Cotta and Triarius at Nicomedia, with a design to invade Pontus; but hearing that Heraclea was in the hands of Mithridates, he dispatched Cotta to reduce that city. Triarius was ordered with the fleet to the Hellespont and Propontis, to intercept the king's fleet, which was daily expected from Spain with supplies from Sertorius. Lucullus himself, with the main strength of the army, pursued his march into Pontus. His army was greatly harassed, especially in the narrow passes between Cappadocia and Pontus, by flying parties of the enemy. But the greatest inconvenience was the want of provisions, as the king's troops had laid waste all the country round; inasmuch that Lucullus having lost almost all his beasts of burden, was obliged to take along with the army 30,000 Galatians, each of them carrying a sack of corn on his back. At last, however, he gained the plains of Pontus; where provisions were so plentiful, that an ox was sold for a drachma, and every thing else in proportion.

The Roman general having now carried the war into the enemy's country, divided his forces, and at the same time invested a very strong town named *Amisus*; another called *Eupatoria*, built by Mithridates, and made

the place of his residence; and another, named *Themiscyra*, situated on the banks of the *Thermoodon*. *Eupatoria* was soon taken, but *Themiscyra* made a vigorous resistance. The townsmen galled the Romans to such a degree, that, not daring to approach the walls openly, they contented themselves with undermining them: but in this too they met with no small difficulty; for the enemy countermined, and often engaged them, under ground, letting into the mines bears and other wild beasts, with swarms of bees, which obliged them to abandon their works. However, the town was at last obliged to surrender for want of provisions. As for *Amisus*, *Lucullus* himself sat down before it: but finding it strongly fortified and garrisoned with the flower of the king's troops, the Roman general thought proper to reduce it by famine; and on this occasion his countrymen first complained of him as protracting the war for his own advantage.

In the mean time *Mithridates*, having recruited his shattered army, advanced to *Cabiræ*, a city not far distant from *Amisus*. *Lucullus*, leaving part of the army to continue the siege, marched at the head of the rest to oppose *Mithridates*. But the king having drawn his cavalry into a general engagement, defeated them with considerable loss, and drove them back to the mountains, through the passes of which *Lucullus* had lately marched to attack him. This check obliged the Roman general to retire to a rising ground near the city of *Cabiræ*, where the enemy could not force him to an engagement. Here provisions beginning to grow scarce, *Lucullus* sent out strong parties from his army into *Capadocia*, the only place from whence he could have supplies. One of these parties entirely defeated *Taxiles* and *Diophantes*, two of the king's generals, who had been stationed there to prevent *Lucullus* from having any communication with the country. The king, upon the news of this defeat, resolved to break up his camp and retire, not questioning but that *Lucullus* would attack him as soon as his forces returned. This resolution he no sooner imparted to his nobles, than they began privately to send away their most valuable goods; which being found out by the soldiers, they took it in such bad part that no intelligence had been given them, that they plundered their baggage, and put those who had the care of it to the sword. After this they betook themselves to flight, crowding out of the gates in the utmost confusion. The king hastened to stop their flight; but nobody showing him the least respect, he was carried away by the crowd, and in great danger of being trampled to death. Having with difficulty made his escape, he retired with a small retinue, first to *Cabiræ*, and then to his son-in-law *Tigranes*, king of *Armenia*. *Lucullus* dispatched the best part of his cavalry to pursue the fugitives; while he himself, with the rest, invested the camp of *Mithridates*, where those remained who could not fly with the rest. The camp was easily taken; but most of the soldiers made their escape, while the Romans, contrary to their general's orders, were busied in plundering. *Lucullus* then pursued hard after the king; who, being overtaken by a company of *Galatians*, caused a mule loaded with part of his treasures to be driven in among them, by which means he made his escape while they quarrelled about the booty. *Mithridates*, remembering in his flight, that he had left his sisters, wives, and concubines

at *Pharnacia*, dispatched an eunuch, named *Bacchus* or *Bacchides*, with orders to put them all to death, lest they should fall into the hands of the enemy; which was accordingly done.

After the flight of *Mithridates*, the Romans no longer met with any opposition; the king's governors flocking from all parts to put themselves under the protection of the conqueror. Among these was the grandfather of *Strabo* the geographer, whom the king had disoblinded by putting to death his cousin-german *Tibias*, and his son *Theophilus*. He was a man of such credit, that it was no sooner heard that he had abandoned the king's party, than 15 other commanders delivered up to *Lucullus* the places with which they had been intrusted; and about the same time *Triarius* sailing up with the king's fleet near the island of *Tenedos*, obtained a complete victory, having either taken or sunk 60 of the enemy's vessels.

All this time *Cotta* had been employed without success in besieging *Heraclea*, which he could never have reduced without the assistance of *Triarius*. That commander, having defeated the fleet, soon reduced the town to such distress, that a third part of the garrison died of hunger; upon which the governor, *Conacorex*, privately agreed with *Triarius* to deliver one of the gates to him. This was accordingly done; and the Romans, entering, made a terrible slaughter of the helpless inhabitants. But in the mean time *Cotta*, provoked at seeing himself deprived both of all share of the booty, and the honour of reducing a place before which he had sat so long, fell upon his countrymen as they were busied in plundering; which would have occasioned a great deal of bloodshed, had not *Triarius* promised to divide the booty equally. *Conacorex*, in order to conceal his treachery, after marching out of *Heraclea*, seized on two forts belonging to the Romans; and *Triarius* being sent to recover them, *Cotta*, in his absence, plundered the city anew, rifled the temples which the other had spared, put all the citizens he could meet with to the sword, and having carried off every thing valuable, at last set fire to the city in several places, by which means it was soon reduced to ashes. *Cotta* then, having no farther occasion for his troops, dismissed the auxiliaries, resigned his legions to *Lucullus*, and put to sea himself in order to return to *Rome*. But he had scarce got out of the harbour, when part of his ships, being overloaded with the spoils of the city, sunk; and the others were by a violent north wind dashed against the shore, which occasioned the loss of a great part of the booty. However, on his return to *Rome*, he was highly applauded by the senate, and honoured with the title of *Ponticus*.

Lucullus, having now reduced *Pontus*, marched against the *Chaldeans*, *Tibarenians*, and inhabitants of *Armenia Minor*; who voluntarily submitted to him, and put him in possession of all their strong holds. From *Armenia*, he returned before *Amisus*, which still held out; *Callimachus*, governor of the place, having harassed the Romans to such a degree by engines of his own contriving, that they had given over their assaults, and contented themselves with blocking it up by land, though the garrison was at the same time plentifully supplied with provisions by sea. *Lucullus*, on his arrival, summoned the city to surrender, offering

ing the inhabitants very honourable terms; but, being refused, he made a general assault at the time when he knew that Callimachus used to draw off great part of his troops to give them some respite. The Romans applying their scaling ladders, got over the wall before Callimachus could come to the assistance of those whom he had left to guard it; however, by setting the city on fire, he found means in that confusion to make his escape. Lucullus commanded his men to use their utmost endeavours to save the city; but they being intent only upon plundering, regarded nothing but the furniture. At last the fire was extinguished by a violent shower; and Lucullus, having with much ado restrained his soldiers from committing any farther excesses, repaired the city in some measure before he left it, and suffered the inhabitants to enjoy their possessions in peace.

45
Tigranes
defeated by
Lucullus,

Nothing was now wanting but the captivity of Mithridates himself to put a final period to the war; and therefore Lucullus demanded him from his son-in-law Tigranes. But though that prince could not be prevailed to see Mithridates on account of his misconduct, he could as little be induced to deliver him up to his enemies. After this refusal, however, he for the first time condescended to see his father-in-law, after he had resided a year and eight months in his dominions. In a private conference held by the two kings, it was agreed, that Tigranes should march against the Romans, and Mithridates with 10,000 horse return into Pontus, where he should make what levies he could, and rejoin Tigranes, before Lucullus, who was then employed in the siege of Sinope, could enter Armenia. But, in the mean time, Sinope having surrendered, Lucullus with all possible expedition marched against Tigranes, and, having drawn him into a general engagement, gave him an entire defeat, as is related under the article ARMENIA.

46
But re-
solves to
try ano-
ther cam-
paign,

Mithridates was marching to his assistance, when he met his son-in-law flying with a small retinue to shelter himself in some remote corner of the kingdom. He encouraged him to raise new forces; not doubting but that another campaign would repair all former losses, provided he would commit to his management every thing relating to the war. To this Tigranes agreeing, as he thought him more fit to deal with the Romans than himself, orders were issued out for raising a new army, and all the Armenians able to bear arms summoned to meet at the place of the general rendezvous. Out of these Mithridates chose 70,000 foot and 35,000 horse; and having trained them up during the winter, after the Roman discipline, in the beginning of the spring he left part of them with Tigranes, and marched himself with the rest into Pontus, where he recovered many important places, and overcame in a pitched battle M. Fabius, whom Lucullus had appointed governor of that province. Being flushed with this success, as soon as the wounds he received in the engagement suffered him to move, he pursued Fabius, and besieged him in the city of Cabira, whither he had retired; but in the mean time Triarius, who was marching out of Asia to join Lucullus, hearing what distress the Romans were in, hastened to their relief, and appearing unexpectedly on the neighbouring hill, struck such terror into the enemy, that they raised the siege, and made the best of their way into Cappadocia. Tri-

arius pursued them, and got so near them as to be parted only by a river. Here he halted with a design to pass the river after he had allowed his men some rest; for they were tired out with long marches. But Mithridates was before-hand with him, and crossing the river on a bridge, where he had placed a strong guard, attacked the Romans with great resolution before they had time to refresh themselves. The battle was bloody, and the event doubtful, till the bridge breaking down with the weight of the multitude that passed, the king's troops who had engaged, relying chiefly on their numbers, began to lose courage, seeing they could receive no farther assistance; and the Romans charging them with fresh vigour, they betook themselves to a precipitate flight. After this engagement, as winter came on, both armies were glad to retire to their winter-quarters.

47
Mithri-
dates de-
feated.

During the winter, Mithridates raised new forces; and having received considerable supplies from Tigranes, took the field early in the spring, in hopes of driving the Romans quite out of Pontus, before Lucullus, who had work enough on his hands in Armenia, could come to their assistance. With this view he marched straight against Triarius and Sornatius, to whom Lucullus had committed the care and defence of that province; and finding them encamped near the city of Gaziurfa, professed them battle; which they declining, he sent a strong detachment to besiege a castle where the Romans had left all their baggage, hoping they would rather venture an engagement to relieve the place, than lose all they had got with so much toil and labour during the war: neither was he disappointed in his hopes; for though Triarius was for keeping close in his camp till the arrival of Lucullus, whom he daily expected, having acquainted him with the danger, the soldiers hearing that the castle was besieged, declared in a tumultuous manner, that if he did not lead them they would march to the relief of the place without his leave. Triarius being thus forced by his own men to fight, drew out his forces against the king, whose army was three times his number; but while they were upon the point of engaging, both armies were by a violent storm forced to retire to their respective camps; but Triarius receiving that very day intelligence of the approach of Lucullus, and fearing he would snatch the victory out of his hands, resolved to make a bold push, and next morning by break of day attack the king in his camp. If he conquered, the glory he thought would be entirely his own; if he were overcome, the enemy could reap no great advantage from his victory, Lucullus being at hand with a powerful army. The king, in that surprise, putting himself at the head of a few troops of his guards, sustained the brunt of the Romans, till the rest of his army drawing up came to his relief, and attacked the enemy with such fury, that the Roman foot were forced to give way, and were driven into a morass, where they were surrounded, and great numbers of them cut in pieces.

48
Defeat
Triarius.

Their horse were likewise put to flight, and pursued with great slaughter, till a Roman centurion in the king's service, pitying his countrymen, attempted to kill him. The king's life was saved by his breastplate; but as he received a deep wound in the thigh, he was obliged to give over the pursuit himself, and those that were about him caused the retreat to be

Pontus.

founded, which, as it was unexpected, occasioned a great confusion in the whole army. The centurion was immediately cut in pieces; but the Roman horse in the mean time getting the start of the enemy, found means to make their escape. Above 7000 of the Romans were killed in that battle; and among them 150 centurions and 24 tribunes, the greatest number of officers that had been lost in any engagement to that day. Mithridates being cured of his wound, that he might not for the future be exposed to such dangers, caused all the Romans that served in his army to be formed into one body, as if they were to be sent out on a party, and then ordered them to retire to their tents, where they were all to a man cut in pieces.

49
All the Romans in the service of Mithridates massacred.

The king, however elated with success, yet would not engage Lucullus; but with long marches hastened into Armenia Minor, and encamped upon a hill near the town of Talura, expecting Tigranes, who was advancing with a strong army to join him. Lucullus, in pursuit of Mithridates, marched over the field of battle, leaving those unburied who had fallen in the engagement, which alienated the minds of the soldiery from him, and they began to be very mutinous; being stirred up by Appius Claudius, whom Lucullus had turned out of his command for his vile behaviour, notwithstanding he was nearly related to him, Lucullus having married his sister. The discontent that prevailed in the army came to such a height, that Lucullus was obliged to lie still in his camp all that summer; the soldiers declaring in a mutinous manner, that they would not follow him any longer, nor serve under a general who refused to share the booty with them.

50
Lucullus recalled, which retrieves the affairs of Mithridates.

These complaints, and the general discontent that reigned in the army, obliged the senate to recal Lucullus, and appoint Manius Acilius Glabrio, consul of that year, in his room. Glabrio arriving in Bithynia, gave notice by public cries to all the cities, that the senate had discharged Lucullus and his army, and confiscated his goods for protracting the war and refusing to comply with their injunctions. Hereupon Lucullus was abandoned by the greater part of his army, and forced to retire into Galatia, not being in a condition to make head against the joint forces of the two kings; who, laying hold of that opportunity, recovered the best part of Pontus, Bithynia, Cappadocia, and Armenia Minor: for though Glabrio had hastened into Pontus, as if he had intended to engage the enemy and rob Lucullus of the victory, yet, upon the first news of the approach of the two kings, he thought fit to retire and leave the country open on all sides to the enemy.

51
Pompey sent against him.

When this was heard at Rome, a law was enacted there by C. Manilius, a tribune of the people, whereby the management of the war against Mithridates and Tigranes was committed to Pompey, and likewise the provinces of Cilicia, then under Quintus Marcius, and of Bithynia under Glabrio. By the same law he was continued in that unlimited power by sea, with which he was invested when he first set out against the pirates of Cilicia. In virtue of this law, Pompey, who had just then ended the war with the Cilician pirates, took upon him the command of the army, and directed all the allies of the Roman people to join him with all possible expedition: but before he took the field, he renewed the alliance which Sylla and Lucullus had concluded with Phraates king of Parthia, and then

sent friendly proposals to Mithridates; who at first seemed inclined to give ear to them, and accordingly dispatched an ambassador to the Roman army to treat of a peace. Pompey required of him to lay down his arms if he was in earnest, and deliver up to him all those who had revolted from the Romans during the war. This demand was no sooner reported abroad in the king's camp, but the deserters, who were very numerous in the king's army, betaking themselves to their arms, threatened to put Mithridates himself to death; and would have occasioned a great disturbance, had not the king appeased the growing tumult, by assuring them, that he had sent ambassadors, not to treat of a peace, but only to take, under pretence of suing for peace, a view of the enemy's strength. He moreover obliged himself, by a solemn oath in the presence of the whole army, never to enter into any treaty of friendship with the Romans, nor to deliver up to them such as had ever served under him.

Pontus.

52
Mithridates rejects his proposals of peace.

Pompey, finding his proposals rejected, advanced against the king with an army of 30,000 foot and 20,000 horse, as Plutarch writes, or 30,000, as we read in Appian, all chosen troops; for he discharged most of those who had served under Glabrio and Lucullus. As he entered Galatia, he was met by Lucullus, who endeavoured to persuade him to march back, the war being near finished, and even deputies sent by the republic to settle the province of Pontus; but not being able to prevail with him, after mutual complaints against each other, they parted; and Pompey removing his camp, commanded the troops that were with Lucullus to join him, except 1600 whom he left to attend Lucullus in his triumph. From thence Lucullus set out for Rome, where he was received by the senate with great marks of esteem, most men thinking him highly injured by the authors of the Manilian law. Pompey pursued his march into Pontus; but finding that he could not by any means draw the king to a battle, he marched back into Armenia Minor, with a design either to reduce that province, or oblige Mithridates to venture a battle in order to relieve it. Mithridates followed him at some distance; and entering Armenia, encamped on a hill over-against the Romans, and, by intercepting their convoys, reduced them to such distress, that they were obliged to remove to a more convenient place, the king cutting off many in their rear, and harassing them with frequent attacks, till he fell into an ambuscade laid by Pompey, whose personal courage and prudent conduct on that occasion confirmed the king in his resolution not to hazard a general engagement. The two armies encamped over-against each other; Pompey on one hill, and the king on another, near the city of Dastira, in the province of Acisilene, at a small distance from the Euphrates, which divides Acisilene from Armenia Minor.

Here Pompey, seeing he could neither draw the king to a battle, nor force his camp, which was pitched on a steep and craggy mountain, began to block him up with a ditch which he carried round the bottom of the hill where the king was encamped; and meeting with no opposition, finished his work, and quite cut off the enemy's communication with the country. Pompey was amazed to see the king thus tamely suffer himself to be shut up; and could not help saying, That he was either a great fool or a great coward: a fool, if he did

53
Is besieged by Pompey.

Pontus. not apprehend the danger he was in; a coward, if, being apprised of it, he did not to the utmost of his power prevent it. By this ditch, which was 150 furlongs in circuit, and defended by many forts raised at small distances from each other, the king was so closely besieged, that he could neither send out parties to forage, nor receive the supplies that came to him from Pontus. He was thus besieged for the space of 45 or 50 days; and his army reduced to such straits, that, having consumed all their provisions, they were at last forced to live on their dead horses. Hereupon Mithridates resolved at all events to break through the Roman fortifications: and accordingly, having put to the sword all those that were sick or disabled, that they might not fall into the enemy's hands, he attacked in the dead of the night the Roman guards; and having overpowered them with his numbers, got safe into the open fields, and continued his march all night towards Armenia Major, where he was expected by Tigranes.

Is over-
reached by
Pompey,
and totally
defeated.

Pompey next morning by break of day pursued the enemy with his whole army; and having with much ado overtaken them, found the king encamped on a hill, to which there was but one ascent, and that guarded by a strong body of foot. The Romans encamped over-against them; but Pompey, fearing the king should make his escape in the night-time, privately decamped, and taking the same rout the enemy were to hold in order to gain Armenia, possessed himself of all the eminences and defiles through which the king was to pass. Mithridates thinking that Pompey was returned to his former camp, pursued his march, and about the dusk of the evening entered a narrow valley, which was surrounded on all sides by steep hills. On these hills the Romans lay concealed, expecting the signal to fall upon the enemy and attack them on all sides at once, while they were tired with their march, and seemingly, as they had sent out no scouts, in great security. Pompey was at first for putting off the attack till the next morning, thinking it not safe to engage in the night-time among such steep and craggy mountains; but was at last prevailed upon, by the earnest prayers and intreaties of all the chief officers of the army, to fall upon the enemy that very night. It was therefore agreed, that in the dead of the night all the trumpets should at once sound the charge, that this signal should be followed by an universal shout of the whole army, and that the soldiers should make what noise they could, by striking their spears against the brass vessels that were used in the camp. The king's army at this sudden and unexpected noise, which was echoed again by the mountains, imagined at first that the gods themselves were come down from heaven to destroy them; and the Romans charging them on all sides with showers of stones and arrows from the tops of the hills, they betook themselves to a precipitate flight; but finding all the passes beset with strong bodies of horse and foot, were forced to fly back into the valley, where, for many hours together, they were exposed to the enemy's shot, without being able, in that confusion, either to attack them or defend themselves. They attempted indeed to make some resistance when the moon rose; but the Romans running down upon them from the hills, did not give them time to draw up, and the place was so narrow that they had not room even to make use of their swords. The king lost on that occasion 10,000

men according to Appian, but 40,000, according to Eutropius and others. On Pompey's side there fell between 20 and 30 private men, and two centurions.

Pontus.
56
Dissest. of
Mithri-
dates.

Mithridates, at the head of 800 horse, broke through the Roman army, and being after this effort abandoned by all the rest, because they were closely pursued by the enemy, he travelled all night attended by three persons only, viz. his wife, or, as Plutarch calls her, his concubine, by name *Hypsicratia*, his daughter Dripetine, and an officer. At day-break he fell in with a body of mercenary horse, and 3000 foot, who were marching to join him. By these he was escorted to the castle of Sinoria, situated on the borders of the two Armenias. As great part of his treasures were lodged here, he rewarded very liberally those who accompanied him in his flight; and taking 6000 talents, withdrew into Armenia. As soon as he entered the borders, he dispatched ambassadors to Tigranes, acquainting him with his arrival; but that prince, who was then on the point of concluding a separate peace with the Romans, clapped his ambassadors in irons, pretending that his son Tigranes, had at the instigation of Mithridates, revolted first to the Parthians, and then to the Romans. Mithridates finding himself thus abandoned, even by his son-in-law, left Armenia; and directing his course towards Colchis, which was subject to him, and not as yet invaded by the Romans, passed the Euphrates the fourth day, and got safe into his own territories.

Pompey sent out several parties in pursuit of the king; but remained himself with the main body of the army in the field of battle, where he built a city, calling it from that remarkable victory *Nicopolis*. This city, with the adjoining territory, he bestowed upon such of his soldiers as were old or disabled; and many flocking to it from the neighbouring countries, it became in a short time a very considerable place. This battle was certainly attended with very fatal consequences for Mithridates; who was forced, his army being entirely either cut off or dispersed, to abandon his own dominions, and fly for shelter to the most remote parts of Scythia. Pompey having concluded a peace with Tigranes, as we have related in the history of Armenia, and settled the affairs of that kingdom, began his march in pursuit of Mithridates through those countries that lie about mount Caucasus. The barbarous nations through which he passed, chiefly the Albanians and Iberians, attempted to stop his march, but were soon put to flight. However, he was obliged, by the excessive cold and deep roads, to pass the winter near the river Cyrus. Early in the spring he pursued his march; but meeting with great opposition from the Iberians, a warlike nation, and entirely devoted to Mithridates, he was employed most part of the summer in reducing them. In the mean time, Mithridates, who had wintered at Dioscurias, on the isthmus between the Euxine and Caspian seas, and had been joined there by such of his troops as had made their escape from the late unfortunate battle, continued his flight through the countries of the Achæans, Zygians, Heniochians, Cercetans, Moschi, and Colchians. Of these nations some received him kindly, and even entered into alliance with him; through others he was forced to make himself a way with his sword.

by the stars, especially in the northern parts of Scythia, and carrying with him even provision of water, to supply the army in the vast deserts through which he marched. He spent two years in warring with these nations, and was often in danger of losing both his life and his army: but at last he overcame them all; and believing Mithridates, of whom he could have no account, to be dead, he marched back into Armenia Minor, where he allowed some rest to his soldiers, who were quite worn out with the hardships they had endured in that expedition. Having refreshed his army, he marched into Pontus, to reduce some strong holds which were still garrisoned by the king's troops. While he was at Aspis in Pontus, many of the king's concubines were brought to him; but he sent them all home to their parents, without offering them the least injury, and thereby gained the affection of the chief lords of Pontus, whose daughters they were. The strong castle of Symphori was delivered up to him by Stratonix, one of the king's concubines, upon no other terms than that he would spare her son Xipharex, who was with the king, in case he should fall into his hands. She likewise discovered to him great treasures hid under ground, which he, with great generosity, bestowed upon her, reserving for himself only some vessels to set off his triumph. Having taken another fort, called the *New Castle*, and to that time looked upon as impregnable, he found in it great store of gold, silver, and other valuable things, which he afterwards consecrated to Jupiter Capitolinus. Here, in looking over the king's manuscripts, he came to discover where the rest of his treasures were concealed, what troops he could raise and maintain, what sums were yearly paid him by his subjects and tributaries, &c. whereby he could make a true estimate of his whole power and wealth. Amongst other manuscripts he found some books of physic, wrote by Mithridates himself, which he commanded Lenæas, a learned grammarian, to translate into Latin.

59
Mithridates ap-
pears again
at the head
of a consi-
derable ar-
my.

Pompey, having thus reduced all Pontus, marched into Syria, with a design to recover that kingdom, and passing through Arabia to penetrate as far as the Red Sea. But while he was employed in this expedition, news was brought him that Mithridates, whom he believed dead, had appeared unexpectedly in Pontus at the head of a considerable army, and surprised Panticapæum, a famous emporium at the mouth of the Euxine Sea. He had lain all this time concealed in the territories of a Scythian prince adjoining to the Palus Mæotis; but hearing that Pompey had left Pontus, and was engaged in other wars, he ventured out of his hiding-place, resolved either to recover his paternal kingdom, or die in the attempt. He returned privately into Pontus and managed matters there so dexterously, that the Roman garrisons knew nothing of his arrival till he appeared with a considerable army in the field. He advanced first to the castle of Symphori; and understanding that Stratonix had delivered it up to Pompey, on condition he would save the life of her son in case he should take him prisoner, the king immediately caused the youth, who was in his army, to be put to death, and his body to be left unburied, Stratonix beholding from the walls the cruel and unnatural murder, for he was her son by Mithridates, and had served him with great fidelity.

At the same time he sent ambassadors to Pompey to treat of a peace, offering to pay a yearly tribute to the republic, on condition he restored to him his kingdom. Pompey replied, that he would hearken to no proposals whatsoever, without the king came to treat with him in person, as Tigranes had done. This Mithridates looked upon as nowise consistent with his dignity; and therefore laying aside all thoughts of an accommodation, began to make what preparations he could for renewing the war.

He summoned all his subjects that were able to bear arms to meet at an appointed place; and having chosen out of the whole multitude 60 cohorts, each consisting of 100 men, he incorporated them with the regular troops that were already on foot. Being now in a condition to act offensively, for Pompey had left but a small number of troops in Pontus, he possessed himself of Phanagorium, Chersonesus, Theodosia, Nymphæum, and several other important places. But in the mean time, Castor, whom Mithridates had appointed governor of Phanagorium, falling out with Tripho, one of the king's favourite eunuchs, killed him, and dreading the king's resentment, stirred up the inhabitants to a revolt: by which means Phanagorium was again lost; but the castle, which was defended by four of the king's sons, Artaphernes, Darius, Xerxes, and Oxathres, held out for some time. The king hastened to their relief; but the castle being set on fire by the rebels, they were forced to surrender themselves to Castor before his arrival. These four sons, with one of the king's daughters, by name *Cleopatra*, Castor sent to the Romans; and fortifying himself in the town, persuaded most of the neighbouring cities, which were oppressed with heavy taxes, and strangely harassed by the king's collectors, to join in the rebellion.

Mithridates finding that he could neither rely upon the soldiery, most of them being forced into the service, nor on his other subjects, who were dissatisfied by reason of the exorbitant taxes, sent ambassadors to invite the princes of Scythia to his relief, and with them his daughters, to be bestowed in marriage upon such as showed themselves most inclined to assist him. But as the ambassadors he employed on this occasion were eunuchs, a race of men no less abhorred by the army than favoured by the king, over whom they had a great ascendant, especially in his old age, the soldiers who were sent to attend them on their journey, put them all to the sword as soon as they were out of the king's reach, and delivered his daughters up to the Romans. Mithridates, finding himself thus deprived of his children, betrayed by his army, and forsaken even by those on whom he chiefly relied, could not yet be induced to submit to the Romans, though Pompey promised him honourable conditions, provided he came to treat with him in person. In this desperate condition, he left no stone unturned to stir up the princes of Asia against the Romans, especially the Parthians; but finding them awed by the great opinion they all had of Pompey, he had recourse at last to the European Gauls whom he understood to be at war with the Romans; and having sent before some of his trusty friends to engage them in his favour, taking leave of his own kingdom, he began his long march, designing to pass through Bosphorous, Cimmericus, Scythia,

62
His extra-
ordinary
design of
invading
Italy.

Pontus. this, Pannonia, &c. and joining the Gauls, pass the Alps, and invade Italy.

This design was no sooner known in the army, but the soldiers openly began to complain and mutiny; exaggerating the boldness of the attempt, the length of the march, and the unsurmountable difficulties that must necessarily attend such a desperate enterprise. The chief commanders did all that lay in their power to divert him from it; representing to him, that if he was not able to cope with the Romans in his own kingdom, much less would he be a match for them in Italy or Gaul, where they could daily receive new supplies; whereas he would lose the greatest part of his army in so long and difficult a march, and the rest perhaps in the first engagement, without any possibility of repairing the loss. But all was to no purpose; for they found him so unalterably fixed in his resolution, that he caused those to be put to death who with most warmth remonstrated against it, not sparing even his own son Exipodras, for dropping some unguarded expressions on that occasion. Thus they were forced to let him pursue his own measures, till they found a more proper opportunity to oppose them, which soon after offered, as they were encamped at Bosphorus Cimmericus, on their march into Scythia.

63

His son
Pharnaces
revolts.

Here Pharnaces, the king's favourite son, whom he had appointed to succeed him, observing the general discontent that reigned in the army, began to entertain thoughts of placing the crown on his own head; and not doubting but the soldiery would stand by him, if he declared against the intended expedition into Italy, openly protested among the Roman deserters, who were a considerable part of the army, that if they would follow him he would return into Pontus. The Romans who were well apprised of the danger that attended such an undertaking, and had most of all exclaimed against it, promised to support him to the utmost of their power, and even encouraged him, upon some expressions which he purposely dropped, to assume the title of *king*, a title which his father seemed determined to hold till he had destroyed, by his rash and desperate attempts, himself, his friends, and his army. Pharnaces, finding he could depend on the Romans, engaged the same night most of the chief commanders in his party, and by their means the greater part of the soldiery. It was agreed, that next morning by break of day all those who had declared in his favour should appear in arms, and with a loud shout proclaim Pharnaces king; which was done accordingly, and the shout returned even by those whom Pharnaces had not thought fit to let into the secret. The king, who had taken up his quarters in the city, being awakened by the noise, sent out some of his domestics to know what had happened in the army. Neither did the officers or soldiers dissemble the matter, but boldly answered, that they had chosen a young king instead of an old dotard governed by eunuchs.

Hereupon Mithridates mounting on horseback, and attended by his guards, went out to appease the tumult: but his guards forsaking him, and his horse being killed under him, he was obliged to fly back into the city; from whence he sent several of his attendants one after another to desire of his son a safe conduct for himself and his friends. But as none of the messengers returned, some being slain, and others hiding

with the new king, Mithridates endeavoured to move his son to compassion, by signifying to him from the walls the distressed condition he was reduced to by a son whom he had favoured above the rest of his children; but finding him nowise affected by his speech, turning to the gods, he beseeched them with many tears to make his son know one day by experience the grief and agony which a father must feel in seeing his love and tenderness requited with such ungrateful and monstrous returns. Having thus spoke, he thanked in a very obliging manner those who had stood by him to the last, and exhorted them to make their submission to the new king on the best terms they could procure; adding, that as for himself, he was determined not to outlive the rebellion of a son whom he had always distinguished with particular marks of paternal affection.

After this, he withdrew into the apartment of his wives and concubines, where he first took poison himself, and then presented it to them, and to his favourite daughters Mithridatis and Nissa, who not long before had been betrothed to the kings of Egypt and Cyprus. To the women it proved immediate death; but on the king, who from his infancy had inured his constitution to poisonous potions, it had so slow an operation, that he was forced, through fear of falling into the rebels' hands, to recur to his sword. Neither did the wound, as he was greatly weakened by the poison, prove mortal: so that the rebels, having in the mean time stormed the town, and broke into the house, found the king wallowing in his blood, but still alive, and in his senses; which Pharnaces hearing, sent some of those that were about him to dress his wounds, with a design to deliver him up to the Romans, and thereby ingratiate himself with Pompey. But, in the mean time, a Gaul, who served in the army, by name *Bitatus*, or *Bithocus*, entering the king's room in quest of booty, and being touched with compassion in seeing him forsaken by all his friends, and struggling on the bare ground with the pangs of death, drawing his sword, put an end to his present agonies, and prevented the insults which he chiefly apprehended if he should fall alive into his son's hands. The barbarian is said, when he first saw the king, to have been so awed with the majesty of his countenance, that, forgetful of his booty, he fled out of the room; but being called back, and earnestly intreated by the dying prince to put an end to his misery, he summoned all his courage to perform, as he did, with a trembling hand, that office; and immediately retired without touching any thing that belonged to the king, though the hopes of a rich booty was the only motive that had led him thither.

Pompey, who was at that time engaged in a war with the Jews, received the first notice of the death of Mithridates as he was on his march to Jerusalem. The messenger who brought the joyful tidings was sent by Pharnaces, and appeared unexpectedly before Pompey with the branch of a laurel, as was customary on the like occasions, twisted round the head of his javelin. When he heard what had happened at Panticapæum, he was so impatient to impart it to the soldiery, that he could not even wait till they had raised him a mound of turf from whence to speak to the army, according to the custom of the camp; but ordered those

those who were by him to form a kind of mount with their saddles, and from thence acquainted the soldiery that Mithridates had laid violent hands on himself, and his son Pharnaces was ready to acknowledge the kingdom as a gift of the people of Rome, or resign it if they were unwilling he should reign. This news was received with joyful shouts of the whole army, and the day solemnized with feasts and sacrifices throughout the camp, as if in Mithridates alone all the enemies of the republic had died. Pompey dispatched without delay a messenger with letters to the senate, acquainting them with the death of Mithridates, and the submission of his son Pharnaces. When his letters were read, the senators were so overjoyed, that they were appointed at the proposal of Cicero, then consul, 12 days for returning due thanks to the gods, who had delivered them from such an insulting and powerful enemy; and the tribunes of the people enacted a law, whereby Pompey, in consideration of his eminent service in the Mithridatic war, was to wear a crown of laurel, with the triumphal gown at the Circensian sports, and a purple gown at the scenical plays.

Pharnaces, when he heard of his father's death, caused his body to be preserved in brine, proposing to present it to Pompey, who had promised to return into Pontus after the reduction of Judæa, and there settle matters to his satisfaction. And accordingly having taken the city and temple of Jerusalem, he set out with two legions for Pontus; and being arrived at Sinope, he was there met by ambassadors from Pharnaces, acquainting him, that their master had forbore assuming the title of king till his will and pleasure were known; that he put both himself and the kingdom entirely into his hands; and that he was willing to attend him at what time or place he thought fit to appoint. The same ambassadors delivered up to Pompey those who had taken Manius Aquilius the Roman legate, whom Mithridates had put to a cruel death, all the prisoners, hostages, and deserters, whether Romans, Greeks, or Barbarians, and the body of Mithridates with his rich apparel and arms, which were greatly admired by Pompey and the other Romans. Both soldiers and officers flocked to see the king's body; but Pompey declined that sight; and, saying that all enmity between that great prince and the people of Rome was ended with his life, he returned the body to the ambassadors, and caused it to be interred with the utmost pomp and magnificence among his ancestors in the burying-place of the kings of Pontus, Pompey defraying all the charges of that ceremony, which was the most costly and pompous that ever had been seen in those parts. With the body Pompey restored his wearing apparel and armour; but the scabbard of his sword, which cost 400 talents, was stolen by Rublius a Roman, and sold to Ariarathes king of Cappadocia; and his cap or turban, which was a very curious piece of workmanship, was privately taken by one Caius, who presented it to Faustus the son of Sylla, in whose house it was kept, and shown for many years after among the many rarities which Sylla had brought out of Asia.

Pompey bestowed the kingdom of Bosphorus on Pharnaces, and honoured him with the title of a friend and ally of the people of Rome. Pharnaces being thus acknowledged king of Bosphorus, sent orders

to all the garrisons of Pontus to submit themselves with the castles and treasures with which they were entrusted, to Pompey, who by that means amassed an immense booty. In the city of Talaura, which Mithridates used to call his wardrobe, he found 2000 cups of onyx set in gold, with such store of gold and silver vessels, of costly furniture, of saddles, bridles, and trappings, set with jewels and precious stones, that the Roman commissaries spent 30 days in taking the inventory of the whole. In another castle he found three large tables with nine salvers of massy gold, enriched with precious stones to an inestimable value; the statues of Minerva, Mars, and Apollo, of pure gold and most curious workmanship; and a pair of gaming-tables of two precious stones, three feet broad, and four feet long, on which was a moon of gold weighing 30 pounds, with their men, all of the same precious stone. In a fort situated among the mountains, were delivered up to him the king's statue of massy gold, eight cubits high, his throne and sceptre, and the bed of Darius the son of Hystaspes. Most of these treasures had been transmitted to him from his ancestors, chiefly from Darius king of Persia; some belonging to the Ptolemies of Egypt, and had been deposited by Cleopatra, as we have hinted above, in the hands of the Coans, who delivered them to Mithridates; and great part of them had been collected by the king himself, who was very fond of rich and stately furniture.

Pompey having thus got entire possession of Pontus, and reduced it to the form of a Roman province, ⁶⁸ Who he-
marched into Asia properly so called; and having win-
tered at Ephesus, early in the spring set out for Italy, ^{stows upon}
with a fleet of 700 ships. As he brought over his ^{him the}
army with him, the senate was under no small appre-
hension lest he should make himself absolute, and rule ^{kingdom of}
without controul. But he no sooner landed at Brun-
dium, than he disbanded the army, without waiting ^{Bosphorus,}
for any decree either of the senate or people; what nei-
ther his friends nor his enemies had believed. His tri-
umph lasted two whole days; and though he was at-
tended in his triumphal chariot by 324 captives of dis-
tinction, among whom were five sons and two daugh-
ters of Mithridates, yet he would not suffer any of them
to be put to death, as had been done by others; but
sent them all back, except such as were of royal ex-
traction, to their respective countries, and even supplied
them with money to defray the charges of their journey.
After his triumph he delivered into the treasury 20,000
talents, though, at the dismissing of the army, he had
divided 16,000 talents among the tribunes and centu-
rions, 2000 sestertiums among the quæstors, and had gi-
ven to each foldier 50 sestertiums.

Pompey had no sooner left Asia, but Pharnaces fell ⁶⁹
unexpectedly upon the Phanagorenses, a people of falls out
Bosphorus, whom Pompey had declared free, because ^{with the}
they had revolted the first of all from Mithridates, and ^{Romans,}
by their example induced others to abandon the king's
party. Pharnaces besieged their chief city Phanago-
ria, and kept them blocked up till, for want of provi-
sions, they were forced to sally out, and put all to the
issue of a battle; which proving unsuccessful, they deli-
vered up themselves and their city to the conqueror.
Some years after, the civil war breaking out between
Cæsar and Pompey, he laid hold of that opportunity
to

to recover the provinces which his father had formerly possessed; and having raised a considerable army, overran Pontus, Colchis, Bithynia, Armenia, and the kingdom of Moschis, where he plundered, as Strabo observes, the temple of the goddess Leucothea. He took the strong and important city of Sinope, but could not reduce Amisus. But, in the mean time, Cæsar having got the better of Pompey and his party, appointed Cn. Domitius Calvinus governor of Asia, enjoining him to make war upon Pharnaces with the legions that were quartered in that province. Domitius immediately dispatched ambassadors to Pharnaces, commanding him to withdraw his troops from Armenia and Cappadocia. The king returned answer, that he was willing to abandon Cappadocia, but as for the kingdom of Armenia Minor, it was part of his hereditary dominions; and therefore he would not resign it till he had an opportunity of laying his pretensions before Cæsar himself, whom he was ready to obey in all things. Hereupon Domitius drawing together what forces he could, marched into Cappadocia, which he recovered without opposition, Pharnaces having abandoned it to make a stand in Armenia, which lay nearer his own dominions. Thither Domitius pursued him; and having overtaken him near Nicopolis, found his army drawn up in battle-array, and the king ready to come to an engagement; which Domitius not declining, both armies advanced.

70.
And de-
feats them,

The king, at the head of a choice body of men, fell upon the Romans' left wing, consisting mostly of raw and undisciplined Asiatics; and having without much ado put them to flight, penetrated to the centre, where the thirty-fifth legion, the only one which Domitius had, after a faint resistance, gave ground, and, retiring to the neighbouring mountains, left their allies to shift for themselves, who were all cut off. Domitius with the remains of his scattered army marched back into Cappadocia; and from thence, winter drawing on, into the province of Asia. The king being puffed up with this victory, and hearing that Cæsar, with the flower of the Roman forces, was engaged at the siege of Alexandria, appointed one Asander governor of Bosphorus, and marched himself into Cappadocia in pursuit of Domitius, with a design to invade Asia, and recover all the provinces which had been once subdued by his father. Bithynia and Cappadocia readily submitted; but Armenia the Lesser, which was held by Dejotarus, made so vigorous a resistance, that he was forced to give over the enterprise, lest the Romans should in the mean time strengthen themselves in Asia, whither he was in haste to march, in hopes of meeting there with the same success as his father Mithridates had done. But before he reached that province, he was informed that Asander had revolted, in hopes of gaining thereby the good-will of the Romans, and obtaining of them the kingdom of Bosphorus for himself. At the same time, he received intelligence that Cæsar, having at last reduced Alexandria, and settled the affairs of Egypt and Syria, was marching into Armenia.

71
Attempts
to outwit
Julius Cæ-
sar,

He was not a little dismayed at this news, and therefore without delay dispatched ambassadors to sue for peace; hoping that Cæsar, who was hastening into Italy with a design to pass over into Africa, would willingly give ear to any proposals of that nature.—

Vol. XV.

Pontus.

Cæsar courteously entertained the ambassadors; and though he did not propose to agree to their conditions, yet, that he might come upon Pharnaces unawares, he showed himself very desirous of entering into a treaty of peace. But, in the mean time, he pursued his march with all possible expedition; and arriving on the confines of Pontus, ordered all the troops that were quartered in the neighbouring provinces to join him; for he had brought from Alexandria but one legion, namely the sixth, and that consisting of 1000 men only, the rest having been killed at the siege of Alexandria. Besides this veteran legion, he found at the place of general rendezvous three others, but all of them very indifferently armed, and worse disciplined. With these forces, however, such as they were, he advanced against Pharnaces; who being greatly frightened at his approach, by reason of the success that had attended him in all his expeditions, again dispatched ambassadors to him with a crown of gold, offering him his daughter in marriage, and promising to do whatever he should require. The ambassadors took care to let him know that their master, though highly obliged to Pompey, yet had never been prevailed upon to send him any supplies during the civil war, which Dejotarus, king of Armenia the Lesser, whom he had honoured with his friendship, had done. Cæsar returned for answer, that he was willing to conclude a peace with Pharnaces, provided he retired without delay from Pontus, returned all the captives and hostages whether Roman or their allies, and restored the goods of the Roman citizens and publicans which he had seized since he first took up arms. He added, that as to his not sending supplies to Pompey, they ought rather to have concealed such an ungrateful proceeding of their master than alleged it as any merit, since the forsaking of one to whom he was indebted for his crown, bespoke him a man of mean, selfish, and unworthy principles.

Pharnaces, upon the return of his ambassadors, acquainted Cæsar that he agreed to the conditions; but finding that Cæsar's affairs called him into Italy, he required a longer term of time for the performance of what was stipulated between them, starting daily new difficulties, in hopes that Cæsar would in the mean time be obliged to depart, and leave his affairs of Pontus in the same posture he had found them. Cæsar seeing himself disappointed, and put off from day to day, could not longer brooke the king's deceitful behaviour. Wherefore he determined to put himself at the head of his small army, and attack the enemy in his camp when he least expected it. And accordingly, marching out in the night, he came by break of day in sight of the king's army; and uttering these words, *Shall this treacherous parricide go unpunished?* broke into the camp at the head of 1000 horse. The king's chariots, which were armed with scythes, caused some small disorder among Cæsar's horse; but in the mean time the rest of his army coming up, he put the enemy to flight, and obtained a complete victory. This battle was fought near the place where Mithridates had routed with great slaughter the Roman army under the command of Triarius. Most of the king's army were either taken or cut in pieces; but Pharnaces himself had the good luck to make his escape while the Romans were busy in plundering the camp. This victory was so quick, that

Cæsar

Pontus. Cæsar in a letter to his friend Aminitius, or Anitius, at Rome, expressed it in three words, thus: "I came, I saw, I conquered." He ever afterwards used to call Pompey a fortunate rather than a great commander, since he had gained his chief glory in the Mithridatic war, fighting with so cowardly an enemy. He divided the rich booty and the spoils of his camp among his soldiers; and because Mithridates had erected a trophy near that place as a monument of his victory over Triarius, which Cæsar, as it was consecrated to the gods, did not think lawful to pull down, he set up another over-against it to transmit to posterity his victory over Pharnaces. After this victory he recovered and restored to the allies of the people of Rome all the places which Pharnaces had possessed himself of during the war, declared Amisus a free city, and appointed Mithridates Pergamenus king of Bosphorus in the room of Pharnaces.

Having thus settled the affairs of Pontus, he set sail for Italy; leaving Domitius Calvinus to pursue the war against Pharnaces, if he should appear again in the field. Pharnaces had retired after the battle to Sinope with 1000 horse, where he was quickly besieged by Domitius, to whom he surrendered the town, upon no other condition than that he should be suffered to retire into Bosphorus with the small body that attended him. This Domitius willingly granted; but caused all the king's horses to be killed, since he had asked a safe-conduct only for his horsemen. With these and a band of Scythians and Sarmatians he attempted to recover the kingdom of Bosphorus; but being met between Theodocia and Panticapeum, both which cities he had reduced, by Asander, who was still in possession of the kingdom, a sharp engagement ensued, wherein the king's men, as not being used to fight on foot, were put to flight, and Pharnaces himself, who remained alone in the field, was surrounded by the enemy, and cut in pieces, after having reigned in Bosphorus Cimmerius, the kingdom which Pompey had bestowed upon him, according to Appian, fifteen years, according to others, seventeen.

⁷³ Is killed in another engagement.
⁷⁴ Pontus again made a kingdom by Marc Antony.
Upon the death of Pharnaces the kingdom of Pontus, was again reduced to the form of a province, and so continued to the triumvirate of Marc Antony, who after the battle at Philippi conferred it upon Darius the son of Pharnaces for his services during the civil war. He continued faithful to the Romans; but did nothing during his reign worth mentioning.

Darius was succeeded in the kingdom by Polemon, likewise preferred to that honour by Marc Antony. He was the son of Zeno, a famous orator of Laodicea, and greatly favoured by Antony. From him that part of Pontus which borders on Cappadocia borrowed the name of *Polemoniæ*. He attended Marc Antony in his expedition against the Parthians; and being taken prisoner in that unsuccessful battle fought by Statianus, he was sent by the king of the Medes, an ally of the Parthians, to conclude a peace with the Romans. In which embassy he acquitted himself so well, that Antony added the kingdom of Armenia to his own dominions. In the war between Antony and Augustus he sided with the former: but after the battle of Actium he was received into favour by the latter; and being sent by Agrippa against Scribonius, who upon the death of Asander had usurped the kingdom of Bosphorus, he

overcame him, and reduced the kingdom of Colchis, which was bestowed upon him by Agrippa, who likewise honoured him with the title of *friend and ally of the people of Rome*. He afterwards waged war with the neighbouring barbarians refusing to live in subjection to the Romans; but was overcome, taken, and put to death, by the Aspungitani, a people bordering, according to Strabo, on the Palus Mæotis.

Upon his death his son Polemon II. was by the emperor Caligula raised to the throne of Bosphorus and Pontus. But the emperor obliged him to exchange the kingdom of Bosphorus with part of Cilicia; and Nero, with his consent, reduced that part of Pontus which he enjoyed to the form of a province. He fell in love with Berenice, daughter to Agrippa king of Judæa; and in order to marry her embraced the Jewish religion. But as the soon became tired of his riotous way of living, and returned to her father; so he renounced his new religion, and again embraced the superstitions of Paganism. Polemon dying without issue, the ancient kingdom of Pontus was parcelled out into several parts, and added to the provinces of Bithynia, Galatia, and Cappadocia, only that part of it which was called *Pontus Polemoniæ* retaining the dignity of a distinct and separate province. ⁷⁵ Is parcelled out into several provinces.
During the civil discords between Vespasian and Vitellius, one Anicetus, first a slave, afterwards freedman, to king Polemon, and lastly commander of the royal navy, took up arms with a design to rescue the kingdom from the Roman bondage; and being joined by great multitudes drawn together with the prospect of spoil, over-ran the country, and possessed himself of Trapezund, a city founded by the Grecians on the utmost confines of Pontus. Here he cut in pieces a cohort made up of the inhabitants, but which had been formerly presented with the privilege of Roman citizens. He likewise burnt the fleet, and with scorn and insults scoured the sea; Mucianus having called to Byzantium most of the Roman galleys. Hereupon Vespasian, who was at that time in Syria, sent Verdius Gemnius into Pontus with a choice body of auxiliaries from the legions. He assailing the enemy while they were in disorder, and roaming asunder in pursuit of prey, drove them into their vessels; then with some galleys chased Anicetus into the mouth of the river Chobus, where he thought himself safe under the protection of Sedochus king of the Lazians, whose alliance he had purchased with large sums and rich presents. Sedochus at first refused to deliver him up to the Romans; but was soon prevailed upon, partly by threats, partly by presents, to surrender both him and all the other fugitives who had taken sanctuary in his dominions. Thus ended that servile war; and the kingdom of Pontus continued to be a province of the empire till the time of David and Alexis Comneni, who being driven from Constantinople by the French and Venetians A. D. 1204, under the command of Baldwin earl of Flanders, settled, the one at Heraclea, the other at Trebifond. The troubles that arose among the Latins gave Alexis Comnenus an opportunity of erecting here a new empire, which comprehended great part of Pontus, and was known by the name of the *empire of Trebifond*. The Comneni held it about 250 years, till the time of Mohammed II. who carried David Comnenus, the last emperor of Trebifond, prisoner to Constantinople, A. D. 1462, with all his family, and subjected his empire to that of Constantinople;

Pontypool, Ponza. nople; in which abject slavery Trebifond and all Pontus have continued ever since.

PONTYPOOL, a town of Monmouthshire in England, seated between two hills. It is but a small place, though noted for its iron-mills, great manufacture of japanned mugs, &c. W. Long. 3. 6. N. Lat. 51. 42.

PONZA, or PONTIA, is a small island of the Tuscan Sea, well known to be the place to which many illustrious Romans were formerly banished. It is situated on the coast of Italy near Terracina, and in the neighbourhood of other small islands or rocks named *Palmarole*, *Zannone*, &c. between the island of Ventotienne and Monte Circello. All these islands were visited by Sir William Hamilton in the year 1785; and an account of his journey is given in a letter to Sir J. Banks, which appeared in the *Phil. Transf.* vol. lxxvi. p. 365. Sir William arrived at Ponza on the 20th August; and, according to his account, it lies about 30 miles from Ventotienne. On the 21st he went round it in a boat. Its length is about five miles, but its breadth is nowhere above half a mile, and in some places not more than 500 feet. It is surrounded by a multitude of detached rocks, some of them very high, and most of them composed of a compact lava. There are many irregularly formed basaltics, but none in large columns. In some places they have a reddish tinge from iron ochre, are very small, and irregularly laid over one another. Some stand perpendicularly, others obliquely, and some lie horizontally. The rocks themselves in which these masses are found are lava of the same nature with the basaltics. At first sight they appear like the ruins of ancient Roman brick or tile buildings. One rock is composed of large spherical basaltics, and in other places our author found the lava inclined to take the like spherical form, though on a much smaller scale, some of the former basaltics being near two feet in diameter. All these rocks, in our author's opinion, have been detached by the sea from this island, which is entirely composed of volcanic matter, lavas, and tufas of various qualities and colours, as green, yellow, black, and white. Some of these matters are more compact in their texture than others; and in some parts great tracts seem to have undergone similar operations, which still subsist at a spot called the *Pisciarelli*, on the outside of the Solfatara, near Puzzole, and where a hot sulphureous vitriolic acid vapour converts all which it penetrates, whether lavas, tufas, volcanic ashes, or pumice-stones, into a pure clay, mostly white, or with a tint of red, blue, green, or yellow.

In one part of this island there is a sort of tufa remarkably good for the purpose of building. It is as hard as Bath-stone, and nearly of the same colour, without any mixture of lava or pumice-stone, which usually abound in the tufas of Naples, Baia, and Puzzoli.

The island of Palmarole which is about four miles from Ponza, is not much more than a mile in circumference. It is composed of the same volcanic matter, and probably was once a part of Ponza; and in our author's opinion it looks as if the island of Zannone, which lies about the same distance from Ponza, was once likewise a part of the same; for many rocks of lava rise above water in a line betwixt the two last-mentioned islands, and the water there is much more shallow than in the gulf of Terracina.

Zannone is much larger and higher than Palmarole;

and that half of it next the continent is composed of a lime-stone similar to that of the Apennines near it; the other half is composed of lavas and tufas, resembling in every other respect the soil of the islands just described. Neither Palmarole nor Zannone are inhabited; but the latter furnishes abundance of brushwood for the use of the inhabitants of Ponza, whose number, including the garrison, amounts to near 1700. The uninhabited island of St Stefano in like manner furnishes wood for the people of Ventotienne. It is probable that all these islands and rocks may in time be levelled by the action of the sea. Ponza, in its present state, is the mere skeleton of a volcanic island; little more than its hard or vitrified parts remaining, and they seem to be slowly and gradually mouldering away. The governor of the castle of Ponza, who had resided there 53 years, told our author that the island was still subject to earthquakes; that there had been one violent shock there about four years before; but that the most violent one he ever felt was on the very day and at the hour that Lisbon was destroyed. Two houses out of three which were then on the island were thrown down. "This (says our author) seems to prove that the volcanic matter which gave birth to these islands is not exhausted."

Fig. 1. Plate CCCCXII. is a plan of the island of Ponza as it is given in the *Philosophical Transactions*. Fig. 2. is a view of the inside of the harbour of the island. A in the same figure is a rock of lava. In many parts it is formed into regular basaltics of a reddish colour, tinged in all probability with some ochre. Most of the detached rocks of the island resemble this. BB represents a tract of volcanic country, converted by a hot sulphureous vitriolic acid vapour into a pure clay, the ground colour of which is mostly white.—Fig. 3. is a view from the outside of the harbour, near the lighthouse. C is a rock of volcanic matter converted to pure clay; D is a rock of the same kind, with strata of pumice-stone; E is a rock of lava, inclining to take basaltic forms; and F is a rock composed of spherical basaltics.

POOD is a Russian weight, equal to 40 Russian or 36 English pounds.

POOL is properly a reservoir of water supplied with springs, and discharging the overplus by sluices, defenders, weirs, and other caufeways.

POOL, a sea-port town of Dorsetshire in England. It is surrounded on all sides by the sea, except on the north, where there is an entrance through a gate. It was formerly nothing but a place where a few fishermen lived: but in the reign of Henry VI. it was greatly enlarged, and the inhabitants had the privilege to wall it round. It was also made a county of itself, and sent two members to parliament. It is governed by a mayor, a senior bailiff, four other justices, and an indeterminate number of burgessees. The town consists of a church and about 600 houses, with broad paved streets; and has a manufactory of knit-hose. It is 47 miles west-south-west of Winchester, and 110 west-by-south of London. W. Long. 2. 0. N. Lat. 50. 42.

POOLE (Matthew), a very learned writer in the 17th century, was born at York in 1624. He was educated at Emanuel-college, Cambridge, and afterwards incorporated in the university of Oxford. He succeeded Dr Anthony Tuckney in the rectory of St Michael de Quern, in London, about 1648. In 1658

he set on foot a project for maintaining youths of great parts at the universities, and had the approbation of the heads of houses in both of them. He solicited the affair with so much vigour, that in a short time 900 l. *per annum* was procured for that purpose; but this design was laid aside at the Restoration. In 1662 he was ejected from his living for nonconformity. He was ten years employed in composing his *Synopsis Criticorum*, &c. Besides this great work he published several other pieces. When Dr Oates's depositions concerning the popish plot were printed, our author found his name in the list of those who were to be cut off, on the account (as was supposed) of what he had written against the papists in his *Nullity of the Romish Faith*. So that he was obliged to retire into Holland, where he died in 1679, and left behind him the character of a very able critic and casuist.

POOP, the stern of a ship; or the highest, uppermost, and hinder part of a ship's hull. See STERN.

POOR, in law, an appellation given to all those who are in such a low and mean condition, that they either are or may become a burden to the community.

They who rank pity amongst the original impulses of our nature rightly contend, that when it prompts us to the relief of human misery, it indicates sufficiently the Divine intention, and our duty. Indeed, the same conclusion is deducible from the existence of the passion, whatever account be given of its origin. Whether it be instinct, or a habit founded in association (see PASSION), it is in fact a property of our nature which God appointed: and the final cause for which it was appointed is to afford to the miserable, in the compassion of their fellow-creatures, a remedy for those inequalities and distresses to which many are necessarily exposed under every possible rule for the distribution of property. That the poor have a claim upon the rich, founded in the law of nature, can be questioned by no man who admits the benevolence of the Deity, and considers his purpose in creating the world (see THEOLOGY, Part I. Sect. ii.); and upon this claim the Christian Scriptures are more explicit than almost upon any other.

The rights of the poor, however, to be relieved by the rich, as they originate, in nature, and are sanctioned by Christianity, are evidently of that kind which is called *imperfect* (See MORAL Philosophy, n^o 151.) It is surely needless to warn our readers in this place, that imperfect rights are in themselves as sacred, and the duties resulting from them as obligatory in *foro conscientie*, as the most rigid claims of justice. Every one knows, that they are called *imperfect* only because the extent of them in particular instances cannot be ascertained by positive laws, nor the breach of them be punished by the civil magistrate. Hence the apostle, tho' he enjoins a weekly contribution to be made for the poor in the church of Corinth, yet leaves the sum to be contributed by each individual wholly undetermined. "Now concerning the collection for the saints, as I have given order to the churches of Galatia, even so do ye. Upon the first day of the week let every one of you lay by him in store as God hath prospered him." By which St Paul certainly recommends to every man to contribute, not a fixed sum, but as much as, from a deliberate comparison of his fortune, with the reasonable

expences and expectations of his family, he finds he can spare for charitable purposes.

It is well known that those weekly contributions were laid at the feet of the apostles, who transferred the management of the fund thence arising to deacons elected by the people, and ordained by them to see that the money was properly distributed. Hence, under Christianity, the maintenance of the poor became chiefly an ecclesiastical concern; and when that holy and benevolent religion was established in the Roman empire, a fourth part of the tithes was in some countries of Europe, and particularly in England, set apart for that purpose. Afterwards, when the tithes of many parishes were appropriated to the monasteries, these societies were the principal resource of the poor, who were farther relieved by voluntary contributions. Judge Blackstone observes, that till the statute 26 Hen. VIII. cap. 26. he finds no compulsory method for providing for the poor; but upon the total dissolution of the monasteries, abundance of statutes were made in the reign of King Henry VIII. Edward VI. and Elizabeth, which at last established the

Poor's Rate, or legal assessment for the support of the poor in England. The sums that had been appropriated for charitable uses before the reformation were immense, and the wealth that had been accumulated through a succession of ages by mendicant orders of religious persons was inconceivably great; nor was it in the power of any laws to confine men who were in the possession of such wealth from gratifying those desires which money can so easily find means of supplying. Yet among the various abuses to which this opulence had given rise, these religious orders had never so far lost sight of their original institution as ever to neglect the poor. These were indeed provided for by them with an indiscriminate profusion of largesse, better proportioned to their own opulence than to the wants of the claimants, who were too often, without examination, all equally served, whether deserving or undeserving of that bounty which they claimed.

When the *religious houses*, as they were called, were entirely suppressed at the reformation, and the wealth that belonged to them was diverted into other channels, the poor, who had been in use to receive their support from thence, were of course left entirely destitute; and this soon became a grievance so intolerable not only to the poor themselves, but to the whole nation, as to excite an universal desire to have it remedied. Accordingly, by the 14 Eliz. cap. 5. power was given to the justices to lay a general assessment; and this hath continued ever since. For by 43 Eliz. cap. 2. the churchwardens and overseers of the poor of every parish, or the greater part of them (with the consent of two justices, one of whom is of the quorum, dwelling in or near the parish), are empowered to raise weekly, or otherwise, by taxation of every inhabitant, parson, vicar, and other, and of every occupier of lands, houses, &c. materials for employing the poor, and competent sums for their relief. Notice shall be given in church of every such rate the next Sunday after it is allowed, which may be inspected by every inhabitant, paying 1s. and copies of it granted on demand, 6d. being paid for every 24 names; and a churchwarden or overseer refusing, shall forfeit 20 l. to the party aggrieved. The

rate

Fig. 2

Fig. 1

Poor.

rate is to be levied by distress on those who refuse to pay it; and, by 17 Geo. II. cap. 2. cap. 38. appeals against it are allowed.

If the justices find that the inhabitants of any parish are not able to levy among themselves sufficient sums for the purposes specified in the act, they may assess any other parish within the hundred; and if the hundred be unable to grant necessary relief, they may rate and assess any parish within the county. 43 Eliz. cap. 2.

In order to compel husbands and parents to maintain their own families, the law hath provided, that all persons running away out of their parishes, and leaving their families upon the parish, shall be deemed and suffer as incorrigible rogues (7 Jac. cap. 4.) And if a person merely threatens to run away and leave his wife and children upon the parish, he shall upon conviction, before one justice by confession, or oath of one witness, be committed to the house of correction for any time not exceeding one month (17 Geo. II. cap. 5.) For the farther maintenance of the poor, there are many fines and forfeitures payable to their use; as for swearing, drunkenness, destroying the game, &c. And also parts of wastes, woods, and pastures, may be enclosed for the growth and preservation of timber and underwood for their relief. See *Work-House*.

The famous statute of the 43d of Elizabeth, which is the basis of all the poor-laws in England, was constructed with a cautious forethought that can perhaps be equalled by few laws that ever were enacted; and if prospective reasoning alone were to be relied on in matters of legislation, it seemed impossible to amend it: yet experience has now proved, with a most demonstrative certainty, that it is not so salutary as was undoubtedly expected.

The persons who composed that law had before their eyes such a recent proof of the abuse that had been made of the charitable beneficence of individuals, that they seem to have been chiefly solicitous to obviate similar abuses in future; and to guard against that partial kind of seduction, they rather choose to establish a despotic power which should be authorized to wrest from every individual in the nation whatever sums it might think proper to call for, trusting to a few feeble devices which they contrived, for curbing that power which was virtually armed with force sufficient to set all these aside whenever it pleased. The consequence has been, that the sums levied for the relief of the poor, which were at first but small are now enormous, and that the demands are increasing in such a rapid manner as to give rise to the most serious and well-grounded apprehensions. In the year 1774, parliament instituted an inquiry into the amount of the poor's-rates in England and Wales, and again in 1783. On comparing these together, the rise during that short period was found to be in England upwards of 850,000 l. *per annum*, being nearly in the proportion of one-third of the rate at the first period. In Wales, during the same period of time, the rates were more than doubled. Nor was this a temporary start, but a part only of a gradual progression. Mr Wenderdon, in his View of England, observes, that "in the year 1680 the poor's-rates produced no more than 665,390 l. in 1764 they stood at 1,200,000 l. and in 1773 they were estimated at 3,000,000 l." It is a known fact (says Mr Beaufoy, in the debate on Mr Gilbert's poor bill, April 17th

1788), that within the last nine years, the poor's-rates have increased one-third, and should they continue increasing in the same proportion for 50 or 53 years they would amount to the enormous sum of 11,230,000 l. a burden which the country could not possibly bear. It was therefore, he added, highly necessary that something should be attempted to prevent this alarming addition, if not to annihilate the present glaring misconduct in the management of the poor."

Such has been the fate of England with regard to poor laws.

In Scotland, the reformation having been carried forward with a still more violent precipitancy than in England, and the funds of the regular clergy being more entirely alienated, the case of the poor there became still more seemingly desperate, and the clamours were also there considerable at that time. Then also it was that the Scottish court, imitating as usual at that time the practice of England, made several feeble attempts to introduce a system of compulsory poor's-rates into that country, but never digested the system so thoroughly as to form a law that could in any case be carried into effect. Many crude laws on this head were indeed enacted; but all of them so evidently inadequate for the purpose, that they never were, even in one instance that we have heard of, attempted at the time to be carried into effect. Indeed it seems to have been impossible to carry them into effect; for they are all so absurd and contradictory to each other, that hardly a single clause of any one of them can be obeyed without transgressing others of equal importance.

The last statute which in Scotland was enacted on this subject bears date September 1st 1691, William and Mary, parl. 1. sess. 7. chap. 21. and it "ratifies and approves *all* former acts of parliament and proclamations of council for repressing of beggars, and maintaining and employing the poor." If this law therefore were now in force, and it never was repealed, no person could with impunity countervail any one of those statutes which it ratifies; but to be convinced how impossible it is to observe them all, the attentive reader needs only to consider those laws and proclamations with respect to the following particulars, *viz.*

1. *The persons appointed to make up the poor's roll.* By the act 1579 this duty is entrusted to the provost and bailies within burgh, and the judge constitute be the king's commission in paroches to landwart. By act 1663, it is the heritors of each parish. By act 1672, it is the ministers and elders of each parish who are to make up this list. By the proclamation of 1692, it is the heritors, ministers, and elders of every parish. By that of 1693, it is the magistrates of royal burghs, and the heritors of vacant [country] parishes; in both cases without either minister or elders. Among this chaos of contradictions how it is possible to act without transgressing some law.

2. *Not less contradictory are the enactments in regard to the persons who are to pay, and the mode of apportioning the sums among them.* By act 1579, the haill inhabitants of the parochin shall be taxed and stented according to the estimation of their substance, without exception of persons. By that of 1663, the one-half is to be paid by the heritors, and the other half by the tenants and possessors, according to their means and substance. By the proclamation of 1692, the one-half is

Poor.

Poor.

to be paid by the heritors, the other by the householders of the parish. By that of 1693, in burghs royal, the magistrates are to stent themselves, conform to such order and custom used and wont in laying on stents, annuities, or other public burdens, in the respective burgh, as may be most effectual to reach all the inhabitants; and the heritors of several vacant [landward] parishes to stent themselves for the maintenance of the respective poor.

3. A still greater diversity takes place in regard to the *application of the sums so stented*. By the act 1579, it would seem that the whole of the money assessed was to be applied to the use of the helpless poor alone, and no part of it for the relief of those who were capable of working. By the act 1663, on the contrary, the whole of this assessment is to be applied for the support of those *only who are able to work*. This is still more specially provided for by the act 1672; where the poor who are unable to work are to be supported by the weekly collections at the kirk doors; and the stented assessments to be applied to the support of those in the correction houses.

It would be tiresome to enumerate all the contradictions that these laws authorise. In regard to the *persons who are required to carry these acts into execution*, it is at different times the chancellor; magistrates; commissioners of excise; sheriffs; justices of the peace; ministers and elders; the presbyteries; heritors, ministers, and elders; heritors alone; commissioners nominated by presbyteries and appointed by the king; the lords of the privy council: in short, no two laws can be found that do not vary from each other in this respect one way or other.

The same variations take place with regard to the building of correction-houses, confinement and punishment of vagrants, application of their work, awarding their services and those of children. In short, there is not one particular in which these laws do not vary from and contradict each other; so that, let any person try to act in virtue of any one of them, it is impossible for him to avoid going in direct opposition to the enactments of some other law which is of equal force with that he has chosen for his guide. In these circumstances it is so far from being surprising that these acts have been suffered to remain in perpetual desuetude, that it would have been truly wonderful if this had not been the case. They have, however, been permitted to remain on the statute-book as a disgrace to the times when they were formed, and as a stumbling-block to those that were to follow. That not one of them is now in force was lately proved by a learned and public-spirited gentleman, to whom his country is on that and many other accounts deeply indebted. Refusing to pay the poor's tax, with which he was assessed by the overseers of the parish in which he happened to reside, he stood an action in the court of session, and prevailed, upon the broad ground, *that there is no law in force in Scotland by which an INVOLUNTARY poor's rate can be established in any parish*.

But how, it will be asked by our readers, are the poor in Scotland really maintained? We answer, by the private alms of individuals, and by certain funds under the management of the *kirk-sessions* (see PRESBYTERIANS). It is the universal practice, each Lord's day, in every parish, for such of the audience as are in

easy circumstances, to give to the poor such an offering of alms as they shall deem proper. This offering is generally dropped into a basin placed at the church-door, and under the immediate care of an elder. When the service is begun, the elder removes with the basin, which he keeps under his charge till the congregation be dismissed. The session then meets, and the money is told over, its amount marked down in the session account book, and deposited in a box kept for that purpose. This box has usually a small slit in the top, through which the pieces of money can be dropped without opening it; and it is closed with two locks, the key of one of which is usually kept by the minister and the other by the kirk-treasurer, so that it can never be opened but in the presence of these two at least.

A kirk-session, when regularly constituted, must always consist of the minister, elders, session-clerk, and kirk-treasurer. None of these ever receive any salary except the session-clerk, who is usually the schoolmaster of the parish, and has a small salary allowed for minuting the transactions. The kirk-treasurer is for the most part one of the elders; and he is an important member of this court. Without his intervention no distribution of the poor's funds is deemed legal; nor can any payments be made, receipts granted, or money transferred, but by him; the minister and session being personally liable to make good all money that may otherwise be given away, should it ever afterwards be challenged by any heritor in the parish.

The precautions taken for the distribution of the poor's funds are likewise simple and excellent, and are as follow.

No money can be legally issued from the poor's funds even by the treasurer and session, unless legal proof can be brought that public intimation has been given from the pulpit immediately after divine service, and before the congregation has dispersed, that a distribution of poor's money is to be made by the session, at such a time and place, specifying the same, and inviting all who have interest in the case to attend if they shall incline. This intimation must be made a full fortnight before the time of distribution; and as every heritor (owner of landed property) in the parish has a right to vote in the distribution of the poor's funds, they may all, if they so incline, then attend and exercise that right: but if none of them should attend, which is often the case, the session has then a right to proceed; and whatever they shall thus do, is deemed strictly legal, and is liable to no challenge. But should they proceed without having given this previous intimation, they may, if the heritors should afterwards challenge it, be made to repay out of their own pockets every shilling they shall have so issued. It sometimes happens, that young ministers, through heedlessness in this respect, expose themselves and families to considerable trouble and loss, which by attention might be easily avoided. In the same way, should a minister and session, without the intervention of a treasurer regularly constituted, lend upon bond or otherwise any of the poor's funds, and should the person so borrowing afterwards fail, these lenders are personally liable to make good the whole, and any heritor in the parish who chooses it can compel him to do so.

The members of the session are also liable to pay all losses, and to account for all sums that it can be intrusted

Poor.

Poor.

frustrated they received, if they neglect to keep regular books, in which every transaction shall be entered : Or, if these books have not been revised and approved of by the presbytery (A) ; but if they shall have been so revised, they cannot be challenged for omission of forms, and can only be made to account for errors, or frauds, or evident dilapidations.

Under this wise and economical system of management, it has been found by the experience of more than 200 years, that in the low parts of the country, where the parishes are in general of such moderate extent as to admit of the people of every part of the parish generally to attend divine service every Lord's day, the ordinary funds have been amply sufficient to supply all the real demands of the poor, and in most parishes a fund has been accumulated from the savings of ordinary years to help the deficiencies that may arise in years of uncommon scarcity.

Besides the weekly collections, the extra offerings at the administration of the Lord's supper, the pious donations of charitable individuals, which are all voluntary, together with some small fees paid for the use of a *mort-cloth* (a black velvet pall) at funerals, which is generally purchased with the poor's money, go to make up this parochial fund. Nor must any one believe that the money which comes through the hands of the administrators of the poor's funds is all that is bestowed upon the poor in Scotland ; far from it : there are a thousand other channels through which the indigent derive consolation and support, all of them tending to produce the happiest effects upon society. A son feels himself ashamed to think that his parents should require the assistance of another to support them ; he therefore strains every nerve when in the vigour of life to spare a little of his earning to render their old age more easy than it might have been ; and sweet to a parent is the bread that is given by the pious attention of a child. If there are several children, they become emulous who shall discover most kindness. It is a pious contention which serves to unite them the closer to each other, by commanding their mutual esteem.

Directly contrary to this is the effect of the poor laws of England, where, in London at least, it is not uncommon to see men in good business neglecting their aged and diseased parents for no better reason than that the parish is bound to find them bread. These laws have other pernicious consequences ; for they are obviously subversive of industry as well as morality among the lower orders of the people. " This is a heavy charge, but no less true than heavy. Fear of want is the only effectual motive to industry with the labouring poor : remove that fear, and they cease to be industrious. The ruling passion of those who live by bodily labour, is to save a pittance for their children, and for supporting themselves in old age. Stimulated by desire of accomplishing those ends, they are frugal and indus-

trious ; and the prospect of success is a continual feast to them. Now, what worse can malice invent against such a man, under colour of friendship, than to secure bread to him and his children whenever he takes a dislike to work ; which effectually deadens his sole ambition, and with it his honest industry ? Relying on the certainty of a provision against want, he relaxes gradually till he sinks into idleness ; idleness leads to profligacy ; profligacy begets diseases ; and the wretch becomes an object of public charity before he has run half his course. Wisely therefore is it ordered by Providence, that charity should in every instance be voluntary, to prevent the idle and profligate from depending on it for support. During the reign of Elizabeth, when the monasteries were recently suppressed, and all their revenues squandered, some compulsion might be necessary to prevent the poor from starving. A temporary provision for this purpose, so contrived as not to supersede voluntary charity, but rather to promote it, would have been a measure extremely proper. Unlucky it is for England that such a measure was overlooked ; but the queen and her parliaments had not the talent of foreseeing consequences without the aid of experience. A perpetual tax for the poor was imposed, the most pernicious tax, says Lord Kames (B), that ever was imposed in any country."

POPA-MADRE, is a town of South America, in Terra Firma. In this place there is a convent and chapel dedicated to the Virgin Mary, to whose image the Spaniards in those parts go in pilgrimage, particularly those who have been at sea. It is seated on a high mountain, 50 miles east of Carthagena. W. Long. 74. 32. N. Lat. 10. 15.

POPÆ. See VICTIMARIUS.

POPAYAN, a province of South America, in the kingdom of New Granada, between the audience of Panama, that of Quito, and the South Sea ; 400 miles in length, and 300 in breadth. A chain of barren mountains runs through the country from north to south ; and near the sea the soil is so soaked with almost continual rains, that few care to reside there, except for the sake of the gold that is met with in great plenty in the sands of the rivulets. This bewitching metal brings many in search of it, though it is a great doubt whether they ever return back alive or not. For this reason the savage Americans are still masters of a great part of it, and continually annoy the Spaniards.

POPAYAN, the capital town of a province of that name in South America, with a bishop's see, a Spanish governor, and where the courts of justice are held. The inhabitants are almost all Creoles. It is 220 miles north-east of Quito. W. Long. 75. 55. N. Lat. 2. 35.

POPE, a name which comes from the Greek word *πάππας*, and signifies *Father*. In the east this appellation is given to all Christian priests ; and in the west, bishops were called by it in ancient times : but now for many

Pope.

many centuries it has been appropriated to the bishop of Rome, whom the Roman Catholics look upon as the common father of all Christians.

Much has been said, much written, and many warm disputes have been carried on concerning the pope, and the power belonging to him, within these two or three last centuries. We shall here, without entering into controversy, lay down distinctly, from the best authority, what the Roman Catholics really believe concerning the *pope*, after having described the manner of his election; and we shall give some other particulars relating to this subject that seem to deserve notice, and are in this country not generally known.

All in communion with the see of Rome unanimously hold, that our Saviour Jesus Christ constituted St Peter the apostle chief pastor under himself, to watch over his whole flock here on earth, and to preserve the unity of it; giving him the power requisite for these ends. They also believe, that our Saviour ordained, that St Peter should have successors with the like charge and power, to the end of time. Now, as St Peter resided at Rome for many years, and suffered martyrdom there, they consider the bishops of Rome as his successors in the dignity and office of the universal pastor of the whole Catholic church. There have been some varieties in the manner of choosing the bishop of Rome in different ages, as alterations may be made in discipline; but still the clergy of Rome have justly had the chief part in that election: and that clergy is now represented by, or in some manner consists of, the *cardinals*, who have for several centuries been the sole electors of the pope.

These *cardinals* or *principal persons* of the church of Rome are 70 in number, when the *sacred college*, as it is called, is complete. Of these six are cardinal bishops, the bishops of Ostia, of Porto, Albano, Sabino, Tusculum or Frascati, and Præneste or Palestrina; which are the six suburbicarian churches; fifty are cardinal priests, who have all titles from parish churches in Rome; and fourteen are cardinal deacons, who have their titles from churches in Rome of less note, called *Diaconias* or *Deaconries*. These cardinals are created by the pope when there happen to be vacancies; and sometimes he names one or two only at a time; but commonly he defers the promotion until there be ten or twelve vacancies or more; and then at every second such promotion the emperor, the kings of Spain and France, and of Britain, when Catholic, are allowed to present one each, to be made cardinal, whom the pope always admits if there be not some very great and evident objection. These cardinals are commonly promoted from among such clergymen as have borne offices in the Roman court; some are assumed from religious orders; eminent ecclesiastics of other countries are likewise often honoured with this dignity, as the archbishops of Toledo and Vienna are at present cardinal priests of Rome. Sons of sovereign princes have frequently been members of the sacred college; and there ends the direct line of the royal family of Stuart. Their distinctive dress is scarlet, to signify that they ought to be ready to shed their blood for the faith and church, when the defence and honour of either require it. They wear a scarlet cap and hat: the cap is given to them by the pope if they are at Rome, and is sent to them if they are absent; but the hat is never given but by the pope's own hand. These cardinals form the pope's standing coun-

cil or *consistory* for the management of the public affairs of church and state. They are divided into different *congregations* for the more easy dispatch of business; and some of them have the principal offices in the pontifical court, as that of cardinal-vicar—penitentiary—chancellor—camerlingo or chamberlain—perfect of the signature of justice—perfect of memorials—and secretary of state. They have the title given them of *eminence* and *most eminent*. But here we consider them principally as the persons entrusted with the choice of the pope. See CARDINAL.

On the demise of a pope his pontifical seal is immediately broken by the chamberlain, and all public business is interrupted that can be delayed: messengers are dispatched to all the Catholic sovereigns to acquaint them of the event, that they may take what measures they think proper; and that the cardinals in their dominions, if any there be, may hasten to the future election if they choose to attend; whilst the whole attention of the sacred college is turned to the preservation of tranquillity in the city and state, and to the necessary preparations for the future election. The cardinal chamberlain has, during the vacancy of the holy see, great authority; he coins money with his own arms on it, lodges in the pope's apartments, and is attended by body-guards. He, and the first cardinal bishop, the first cardinal priest, and the first cardinal deacon, have, during that time, the government almost entirely in their hands. The body of the deceased pope is carried to St Peter's, where funeral service is performed for him with great pomp for nine days, and the cardinals attend there every morning. In the mean time, all necessary preparations for the election are made; and the place where they assemble for that purpose, which is called the *conclave*, is fitted up in that part of the Vatican palace which is nearest to St Peter's church, as this has long been thought the most convenient situation. Here is formed by partitions of wood a number of cells or chambers equal to the number of cardinals, with a small distance between every two, and a broad gallery before them. A number is put on every cell, and small papers with corresponding numbers are put into a box: every cardinal, or some one for him, draws out one of these papers, which determines in what cell he is to lodge. The cells are lined with cloth; and there is a part of each one separated for the conclavists or attendants, of whom two are allowed to each cardinal, and three to cardinal princes. They are persons of some rank, and generally of great confidence; but they must carry in their master's meals, serve him at table, and perform all the offices of a menial servant. Two physicians, two surgeons, an apothecary, and some other necessary officers, are chosen for the conclave by the cardinals.

On the 10th day after the pope's death the cardinals, who are then at Rome, and in a competent state of health, meet in the chapel of St Peter's, which is called the *Gregorian chapel*, where a sermon on the choice of a pope is preached to them, and mass is said for invoking the grace of the Holy Ghost. Then the cardinals proceed to the conclave in procession two by two, and take up their abode. When all is properly settled, the conclave is shut up, having boxed wheels or places of communication in convenient quarters: there are also strong guards placed all around. When any

Pope.

Pope.

foreign cardinal arrives after the inclosure, the conclave is opened for his admission. In the beginning every cardinal signs a paper, containing an obligation, that if he shall be raised to the papal chair he will not alienate any part of the pontifical dominion; that he will not be prodigal to his relations; and any other such stipulations as may have been settled in former times or framed for that occasion.

We come now to the election itself; and that this must be effectual, two thirds of the cardinals present must vote for the same person. As this is often not easily obtained, they sometimes remain whole months in the conclave. They meet in the chapel twice every day for giving their votes; and the election may be effectual by *scrutiny*, *accession*, or *acclamation*. Scrutiny is the ordinary method; and consists in this: every cardinal writes his own name on the inner part of a piece of paper, and this is folded up and sealed; on a second fold of the same paper a conclavist writes the name of the person for whom his master votes. This, according to agreements observed for some centuries, must be one of the sacred college. On the outer side of the paper is written a sentence at random, which the voter must well remember. Every cardinal, on entering into the chapel, goes to the altar and puts his paper into a large chalice.

When all are convened, two cardinals number the votes; and if there are more or less than the number of cardinals present, the voting must be repeated. When that is not the case, the cardinal appointed for the purpose reads the outer sentence, and the name of the cardinal under it, so that each voter hearing his own sentence and the name joined with it, knows that there is no mistake. The names of all the cardinals that are voted for are taken down in writing, with the number of votes for each; and when it appears that any one has two-thirds of the number present in his favour the election is over: but when this does not happen, the voting papers are all immediately burnt without opening up the inner part. When several trials of coming to a conclusion by this method of *scrutiny* have been made in vain, recourse is sometimes had to what is called *accession*. By it, when a cardinal perceives that one or very few votes are wanting to any one for whom he had not voted at that time, he may say that he *accedes* to the one who has near the number of votes requisite; and if his one vote suffices to make up the two-thirds, or if he is followed by a sufficient number of *acceders* or new voters for the said cardinal, the election is accomplished. Lastly, a pope is sometimes elected by *acclamation*; and that is, when a cardinal, being pretty sure that he will be joined by a number sufficient, cries out in the open chapel, that such an one shall be pope. If he is supported properly, the election becomes unanimous; those who would perhaps oppose it foreseeing that their opposition would be fruitless, and rather hurtful to themselves. It is to be observed, that the emperor of Germany and the kings of France and Spain claim a right of excluding one cardinal from being pope at every election. Hence, when the ambassador at Rome of any of these sovereigns perceives that any cardinal, disagreeable to his master, according to the instructions he has received, is like to be made pope, he demands an audience of the conclave, is admitted, and there declares his master's will, which is always attended to for

VOL. XV.

the common good. But each of those sovereigns is allowed thus to exclude only one at one time; and they unwillingly and seldom put this right in execution.

When a pope is chosen in any of the three above-mentioned ways, the election is immediately announced from the balcony in the front of St Peter's, homage is paid to the new pontiff, and couriers are sent off with the news to all parts of Christendom. The pope appoints a day for his coronation at St Peter's, and for his taking possession of the patriarchal church of St John Lateran; all which is performed with great solemnity. He is addressed by the expression of *Holiness*, and *most holy Father*.

Let us now proceed to see what authority Roman Catholics attribute to the pope thus chosen. They believe, then, that the bishop of Rome is, under Christ, supreme pastor of the whole church; and as such is not only the first bishop in order and dignity, but has also a power and jurisdiction over all Christians, in order to preserve unity and purity of faith and moral doctrine, and to maintain order and regularity in all churches. Wherefore they hold, that when the pope understands that any error has been broached against faith or manners, or that any considerable difference on such subjects has arisen in any part of Christendom, it belongs to him, after due deliberation and consultation, to issue out his pastoral decree, condemning the error, clearing up the doubt, and declaring what has been delivered down, and what is to be believed. Some Catholic divines are of opinion that the pope cannot err, when he thus addresses himself to *all the faithful* on matters of doctrine. They well know, that as a private doctor he may fall into mistakes as well as any other man; but they think, that when he teaches the whole church Providence must preserve him from error; and they apprehend, that this may be deduced from the promises of Christ to St Peter, and from the writings of the ancient fathers. However, this infallibility of the pope, even when he pronounces in the most solemn manner, is only an opinion, and not an article of Roman Catholic faith. Wherefore, when he sends for the doctrinal decrees, the other bishops, who are also guardians of the faith in an inferior degree, may, with due respect, examine these decrees; and if they see them agree with what has been always taught, they either formally signify their acceptance, or they tacitly acquiesce, which, considering their duty, is equivalent to a formal approbation. When the acceptance of the generality of the bishops has been obtained, either immediately or after some mutual correspondence and explanation, the decrees of the pope thus accepted come to be the sentence of the whole church, and are believed to be beyond the possibility of error!

Sometimes it may happen that the disputes and difference may be so great and intricate, that to the end it may be seen more clearly what has really been delivered down; and to give all possible satisfaction, it may appear proper to convene all the bishops who can conveniently attend to one place, to learn from them more distinctly what has been taught and held in their respective churches. Roman Catholics believe that it belongs to the pope to call such general councils, and to preside in them in person or by his legates. They likewise hold, that when the pope has approved the decrees of such councils concerning faith or manners,

Pope.

Pope.

such decrees are then final, and must be received as such by all Catholics. In all this they believe, that the particular assistance of the Holy Ghost is with the pastors of the church, that *so the gates of hell may never prevail against her.*

The see of Rome, according to Roman Catholics, is the centre of Catholic unity. All their bishops communicate with the pope, and by his means with one another, and so form one body. However distant their particular churches may be, they all meet at Rome either in person or by their delegates, or at least by their letters. And, according to the discipline of the latter ages, though they are presented to the pope for their office from their respective countries, yet from him they must receive their bulls of consecration before they can take possession of their sees.

In matters of church discipline, the pope, as chief pastor, not only ought to take care that the canons actually in force be observed in all churches, but he may also make new canons and regulations when he sees it necessary or expedient for the spiritual benefit of the faithful, according to times and circumstances. But in doing this he must not infringe the established rights or customs with injury to any person; which if, through mistake or wrong information, he should ever do, the persons who think themselves aggrieved may remonstrate with respect and sue for redress. He may establish new episcopal sees, where there have been none before; and he may alter the limits of former dioceses; but in such alterations he always of course consults the temporal sovereign, if in communion with him. He sends pastors to preach the gospel to all countries where the Catholic religion is not by law established; and to him appeals may be made from all parts of Christendom in ecclesiastical causes of great importance.

The pope may dispense with the observation of ecclesiastical canons when there are just reasons for it, as may frequently happen; he may also dispense with vows when they are made with that express or tacit condition (A) that he really may dispense with them; he may also on some occasions declare that obligations have really ceased when that is truly the case, from a great alteration of circumstances: But he can never grant any dispensation, to the injury of any third person, and can never allow any one to do what is unjust, or to say what he knows to be false, whatever advantage might be expected from it.

The pope is also a temporal prince, and possesses considerable dominions in the middle part of Italy, besides Avignon, which the French have lately taken from him, and the duchy of Benevento inclosed within the kingdom of Naples. It is also supposed that the kingdom of Naples and Sicily, and the duchies of Parma and Placentia, are still held of him in fief as they were before. His predecessors have acquired these possessions at different times and on different occasions, by various donations, concessions, treaties, and agreements, in like manner as has happened with regard to the establishment of other sovereignties; and his title to them is like to that of other potentates to their respective possessions. The revenue arising from this estate, and

Pope.

what he receives for various reasons from Catholic countries, which is now much reduced, is employed for the support of government, in salaries to the officers of his court, for the education of clergymen, and for the maintaining of missionaries in infidel countries. Great sums are particularly expended for the propagation of the Christian faith in different parts of Asia, especially in Armenia, Syria, and China. Nor is it much to be wondered at, if the families, of which the sovereign pontiffs happen to have been born, acquire greater riches and splendor from that connection. The princely families of Barberini, Borghese, Chigi, Corsini, Albani, are examples of this kind: but regulations have been made in later times to prevent excessive nepotism. Beyond the limits of his own temporal dominions the pope has no temporal power or jurisdiction, excepting what any nation may be pleased to allow him: when any thing of that kind has been granted or brought in by custom, it is evident that it ought not to be taken away rashly nor without just reason. But, as chief pastor of the church, he has no right to any temporal jurisdiction over his flock. As such, his power is entirely spiritual, and has no means of coercion originally or necessarily connected with it, but only ecclesiastical censures. It must be owned, that the popes, in some ages, sometimes imagining that they could do much good, sometimes by the consent, or even at the desire, of the sovereigns, and sometimes no doubt out of ambitious views, have interfered a great deal in the temporal affairs of the different kingdoms of Europe, which has frequently given scandal and done harm to religion. But it is known to those most versant in history, that their faults of this kind have been exaggerated, and their conduct often misunderstood or misrepresented. However, in this a Roman Catholic is not obliged to approve what they have done; nay, without acting contrary to his religion, he may judge of them freely, and blame them if he think they deserve it; only he will do it with respect and regret. Thus a Roman Catholic may either apologise, if he think he can do it, for the conduct of Innocent III. in deposing king John of England; or, without being guilty of any offence against his religion, he may blame the pontiff for what he did on that occasion; because the power of the pope to depose princes, or to absolve subjects from their allegiance, was never proposed as an article of faith, or made a term of communion with the church of Rome. Some Catholic divines, indeed, especially among the Jesuits, are universally known to have held this extravagant and dangerous opinion; but by far the greater part of them condemn and abhor it as absurd and impious: and surely it is but fair and just to allow them to know best what they themselves believe. And here, to conclude, we shall add, that it is very desirable that Christians of all denominations endeavour to understand one another better than they have often done; and instead of supposing imaginary differences, strive to remove real ones, for the general good of mankind, for the glory of God, and honour of religion; and that all vie with one another to excel in just and charitable sentiments, language, and behaviour.

The.

(A) Any other man may unquestionably do the same when they are made with that express condition.

Pope.

The reader, who wishes to know what can be urged for and against the supremacy of pope, and who is fitted by his knowledge of ecclesiastical history to understand the nature of the question at issue, may consult, on the one hand, the works of Bellarmine, together with a small tract lately published in English, under the title of *The Divine Economy of Christ in his kingdom or Church*; and on the other, Barrow's treatise on the *Pope's Supremacy*, together with Chillingworth's *Religion of Protestants*, &c.

POPE (Alexander), a celebrated English poet, was descended from good families, and born the 8th of June 1688, at London, where his father was then a considerable merchant. He was taught to read very early by an aunt; and learned to write without any assistance, by copying printed books. The family being of the Romish religion, he was put, at eight years of age, under one Taverner, a priest, who taught him the rudiments of the Latin and Greek tongues together; and soon after was sent to a Popish seminary at Winchester, from whence he was removed to a school at Hyde-Park Corner. He discovered early an inclination to versifying; and the translations of Ogilby and Sandys from Virgil and Ovid first falling in his way, they were his favourite authors. At twelve he retired with his parents to Blisfield, in Windsor Forest; and there became acquainted with the writings of Spenser, Waller, and Dryden. Dryden struck him most, probably because the cast of that poet was most congenial with his own; and therefore he not only studied his works intensely, but ever after mentioned him with a kind of rapturous veneration. He once obtained a sight of him at a coffee-house, but never was known to him: a misfortune which he laments in these short but expressive words, *Virgilium tantum vidi*. Though Pope had been under more tutors than one, yet it seems they were so insufficient for the purpose of teaching, that he had learned very little from them: so that, being obliged afterwards to begin all over again, he may justly be considered as one of the *αὐτοδιδάκτοι* or *self-taught*. At fifteen he had acquired a readiness in the two learned languages; to which he soon after added the French and Italian. He had already scribbled a great deal of poetry in various ways; and this year set about an epic poem called *Alxander*. He long after communicated it to Atterbury, with a declared intention to burn it; and that friend concurred with him: "Though (adds he) I would have interceded for the first page, and put it, with your leave, among my curiosities." What the poet himself observes upon these early pieces is agreeable enough; and shows, that though at first a little intoxicated with the waters of Helicon, he afterwards arrived to great sobriety of thinking. "I confess (says he) there was a time when I was in love with myself; and my first productions were the children of Self-love upon Innocence. I had made an epic poem, and panegyrics on all the princes; and I thought myself the greatest genius that ever was. I cannot but regret these delightful visions of my childhood, which like the fine colours we see when our eyes are shut, are vanished for ever." His pastorals, begun in 1704, first introduced him to the wits of the time; among which were Wycherly and Walsh. This last gentleman proved a sincere friend to him; and soon discerning that his talent lay, not so much in striking out new thoughts of his own, as in

improving those of other men, and in an easy verification, told him, among other things, that there was one way left open for him to excel his predecessors in, which was correctness: observing, that though we had several great poets, yet none of them were correct. Pope took the hint, and turned it to good account; for no doubt the distinguishing harmony of his numbers was in a great measure owing to it. The same year, 1704, he wrote the first part of his *Windsor Forest*, though the whole was not published till 1710. In 1708, he wrote the *Essay on Criticism*: which production was justly esteemed a masterpiece in its kind, and showed not only the peculiar turn of his talents, but that those talents, young as he was, were ripened into perfection. He was not yet twenty years old; and yet the maturity of judgment, the knowledge of the world, and the penetration into human nature, displayed in that piece, were such as would have done honour to the greatest abilities and experience. But whatever may be the merit of the *Essay on Criticism*, it was still surpassed, in a poetical view, by the *Rape of the Lock*, first completely published in 1712. The former excelled in the didactic way, for which he was peculiarly formed; a clear head, strong sense, and a sound judgment, being his characteristic qualities; but it is the creative power of the imagination that constitutes what is properly called a poet; and therefore it is in the *Rape of the Lock* that Pope principally appears one, there being more *vis imaginandi* displayed in this poem than perhaps in all his other works put together. In 1713, he gave out proposals for publishing a translation of Homer's *Iliad*, by subscription; in which all parties concurred so heartily, that he acquired a considerable fortune by it. The subscription amounted to 6000 l. besides 1200 l. which Lintot the bookseller gave him for the copy. Pope's finances being now in good condition, he purchased a house at Twickenham, whither he removed with his father and mother in 1715: where the former died about two years after. As he was a Papist, he could not purchase, nor put his money to interest on real security; and as he adhered to the cause of King James, he made it a point of conscience not to lend it to the new government; so that, though he was worth near 20,000 l. when he laid aside business, yet, living afterwards upon the quick stock, he left but a slender subsistence to his family. Our poet, however, did not fail to improve it to the utmost: he had already acquired much by his publications, and he was all attention to acquire more. In 1717, he published a collection of all he had printed separately; and proceeded to give a new edition of Shakespeare; which, being published in 1721, discovered that he had consulted his fortune more than his fame in that undertaking. The *Iliad* being finished, he engaged upon the like footing to undertake the *Odyssey*. Mr Broome and Mr Fenton did part of it, and received 500 l. of Mr Pope for their labours. It was published in the same manner, and on the same conditions to Lintot; excepting that, instead of 1200 l. he had but 600 l. for the copy. This work being finished in 1725, he was afterwards employed with Swift and Arbuthnot in printing some volumes of *Miscellanies*. About this time he narrowly escaped losing his life, as he was returning home in a friend's chariot; which, on passing a bridge, happened to be overturned, and thrown with the horses into the river.

Pope

Pope.

The glasses were up, and he was not able to break them: so that he had immediately been drowned, if the postillion had not broke them, and dragged him out to the bank. A fragment of the glass, however, cut him so desperately, that he ever after lost the use of two of his fingers. In 1727 his *Dunciad* appeared in Ireland; and the year after in England, with notes by Swift, under the name of *Scribblers*. This edition was presented to the king and queen by Sir Robert Walpole; who, probably about this time, offered to procure Pope a pension, which however he refused, as he had formerly done a proposal of the same kind made him by Lord Halifax. He greatly cultivated the spirit of independency; and "Unplac'd, unpension'd, no man's heir or slave," was frequently his boast. He somewhere observes, that the life of an author is a state of warfare: he has shown himself a complete general in this way of warring. He bore the insults and injuries of his enemies long; but at length, in the *Dunciad*, made an absolutely universal slaughter of them: for even Cibber, who afterwards advanced to be the hero of it, could not forbear owning, that nothing was ever more perfect and finished in its kind than this poem. In 1729, by the advice of Lord Bolingbroke, he turned his pen to subjects of morality; and accordingly we find him, with the assistance of that noble friend, who furnished him with the materials, at work this year upon the *Essay on Man*. The following extract of a letter to Swift discovers the reason of his Lordship's advice: "Bid him (says Bolingbroke) talk to you of the work he is about, I hope in good earnest; it is a fine one, and will be, in his hands, an original. His sole complaint is, that he finds it too easy in the execution. This flatters his laziness: it flatters my judgement; who always thought, that, universal as his talents are, this is eminently and peculiarly his, above all the writers I know, living or dead; I do not except Horace." Pope tells the dean in the next letter, that "the work Lord Bolingbroke speaks of with such abundant partiality, is a system of ethics, in the Horatian way." In pursuing the same design, he wrote his *Ethic Epistles*: the fourth of which, upon Taste, giving great offence, as he was supposed to ridicule the duke of Chandos under the character of Timon, is said to have put him upon writing satires, which he continued till 1739. He ventured to attack persons of the highest rank, and set no bounds to his satirical rage. A genuine collection of his letters was published in 1737. In 1738, a French translation of the *Essay on Man*, by the Abbé Refnel, was printed at Paris; and Mr Croufaz, a German professor, animadverted upon this system of ethics, which he represented as nothing else but a system of naturalism. Mr Warburton, afterwards bishop of Gloucester, wrote a commentary upon the *Essay*; in which he defends it against Croufaz, whose objections he supposes owing to the faultiness of the Abbé Refnel's translation. The poem was republished in 1740, with the commentary. Our author now added a fourth book to the *Dunciad*, which was first printed separately in 1742: but the year after, the whole poem came out together, as a specimen of a more correct edition of his works. He had made some progress in that design, but did not live to complete it. He had all his life long been subject to the head ach; and that complaint, which he derived from

his mother, was now greatly increased by a dropsey in his breast, under which he expired the 30th of May 1744, in the 56th year of his age. In his will, dated December 12. 1743, Miss Blount, a lady to whom he was always devoted, was made his heir during her life: and among other legacies, he bequeathed to Mr Warburton the property of all such of his works, already printed, as he had written, or should write commentaries upon, and which had not otherwise been disposed of or alienated; with this condition, that they were published without future alterations. In discharge of this trust, that gentleman gave a complete edition of all Mr Pope's works, 1751, in 9 vols, 8vo. A work, entitled, *An Essay on the Writings and Genius of Pope*, by Mr Warton, 2 vols 8vo, will be read with pleasure by those who desire to know more of the person, character, and writings of this excellent poet. Lord Orrery's account of him is very flattering: "If we may judge of him by his works (says this noble author), his chief aim was to be esteemed a man of virtue. His letters are written in that style; his last volumes are all of the moral kind; he has avoided trifles, and consequently has escaped a rock which has proved very injurious to Swift's reputation. He has given his imagination full scope, and yet has preserved a perpetual guard upon his conduct. The constitution of his body and mind might really incline him to the habits of caution and reserve. The treatment which he met with afterwards, from an innumerable tribe of adversaries, confirmed this habit; and made him slower than the dean in pronouncing his judgment upon persons and things. His prose-writings are little less harmonious than his verse; and his voice, in common conversation was so naturally musical, that I remember honest Tom Southern used to call him the *little nightingale*. His manners were delicate, easy, and engaging; and he treated his friends with a politeness that charmed, and a generosity that was much to his honour. Every guest was made happy within his doors; pleasure dwelt under his roof, and elegance presided at his table."

Yet, from Dr Johnson's account of his domestic habits, we have reason to doubt the latter part of this character. His parsimony (he informs us) appeared in very petty matters, such as writing his compositions on the backs of letters, or in a niggardly reception of his friends, and a scantiness of entertainment—as the setting a single pint on the table to two friends, when, having himself taken two small glasses, he would retire, saying, I leave you to your wine. He sometimes, however, the Doctor acknowledges, made a splendid dinner; but this happened seldom. He was very full of his fortune, and frequently ridiculed poverty; and he seems to have been of an opinion not very uncommon in the world, that to want money is to want everything. He was almost equally proud of his connection with the great, and often boasted that he obtained their notice by no meanness or servility. This admiration of the great increased in the advance of life; yet we must acknowledge, that he could derive but little honour from the notice of Cobham, Burlington, or Bolingbroke.

By natural deformity, or accidental distortion, his vital functions were so much disordered, that his life was a long disease; and from this cause arose many of his peculiarities and weaknesses. He stood constantly

Pope.

Pope.

in need of female attendance; and to avoid cold, of which he was very sensible, he wore a fur doublet under his shirt, &c. The indulgence and accommodation which his sickness required, had taught him all the unpleasing and unsocial qualities of a valetudinary man.—When he wanted to sleep, he nodded in company; and once slumbered at his own table when the prince of Wales was talking of poetry. He was extremely troublesome to such of his friends as asked him out, which many of them frequently did, and plagued the servants beyond description. His love of eating is another fault to which he is said to have fallen a sacrifice. In all his intercourse with mankind, he had great delight in artifice, and endeavoured to attain all his purposes by indirect and unsuspected methods.

In familiar conversation it is said he never excelled; and he was so fretful and so easily displeased, that he would sometimes leave Lord Oxford's silently without any apparent reason, and was to be courted back by more letters and messengers than the servants were willing to carry.

Dr Johnson also gives a view of the intellectual character of Pope, and draws a parallel between Dryden and him. For particulars, however, we must refer our readers to *Johnson's Lives of the Poets*.

Pope's Dominions, or Ecclesiastical States, a country of Italy, bounded on the north by the gulph of Venice and the Venetian dominions, on the south by the Mediterranean, on the east by the kingdom of Naples and the Adriatic, and on the west by Tuscany and Modena. It is 400 miles long on the coast of the Adriatic from Naples to the Venetian territory. It is but narrow, however, from north to south, not being more than 80 miles broad from the gulph of Venice to the Tuscan sea.

The soil, in general, of the pope's dominions is very fertile, but ill cultivated; and there are many fens and marshy grounds which are very prejudicial to the air. That the lands are badly cultivated and inhabited, the air bad, and the inhabitants poor, idle, lazy, and grossly superstitious, is owing to a variety of causes. With respect to the accommodations of life, this country is but in a very indifferent condition; for, notwithstanding the fertility of its soil, its advantageous situation for traffic, the large sums spent in it by travellers, or remitted to it from foreign countries, and its having, for its ruler, the successor of St Peter, the prince of the apostles, and the vicar of Jesus Christ; yet it is poor and thin of inhabitants, ill cultivated, and without trade and manufactures. This is partly owing to the great number of holidays, of sturdy beggars called *pilgrims*, and of hospitals and convents, with the amazing but perhaps useless wealth of churches and convents, and the inquisition: but the chief cause is the severity of the government, and the grievous exactions and hardships to which the subjects are exposed. The legates, though mostly clergymen, whose thoughts should be chiefly employed about laying up treasures in heaven, and who ought to set an example to the laity of disinterestedness and a contempt of this world, too often, it is said, scruple no kind of rapaciousness: even the holy father himself, and the cardinals, frequently make the enriching of their nephews and other relations, and the aggrandizing their families, too much the business of their lives. The extensive claims and great pretensions of the pope are well

known, and by a large part of Christendom, are now treated with contempt and mockery. The Reformation gave a great blow to his spiritual power; and the French revolution has lessened it still more. His temporal dominions, however, still continue much the same; though how long this may be the case, considering how much he hath lost, and is daily losing, of his ghostly empire, and the veneration in which he was formerly held, it is difficult to say. See *POPE*, p. 378. col. 1.—The Campania of Rome is under the pope's immediate government; but the other provinces are governed by legates and vicellegates, and there is a commander in chief of the pope's forces in every province. The pope is chosen by the cardinals in the conclave: See this particularly described under *POPE*. The pope holds a consistory of cardinals on ecclesiastical affairs; but the cardinals do not meddle with his civil government. The pope's chief minister is the cardinal-patron, usually his nephew, who amasses an immense estate, if the reign be of any long duration. The cardinal that is chosen pope must generally be an Italian, and at least 55 years of age. The spiritual power of the pope, though far short of what it was before the Reformation, is still considerable. It is computed that the monks and regular clergy, who are absolutely at his devotion, do not amount to less than 2,000,000 of people, dispersed through all the Roman Catholic countries, to assert his supremacy over princes, and promote the interest of the church. The revenues of these monks do not fall short of L. 20,000,000 Sterling, besides the casual profits arising from offerings, and the people's bounty to the church, who are taught that their salvation depends on this kind of benevolence.

The pope's revenues, as a temporal prince, may amount to about L. 1,000,000 Sterling *per annum*, arising chiefly from the monopoly of corn, the duties on wine and other provisions. Over and above these, vast sums are continually flowing into the papal treasury from all the Roman Catholic countries, for dispensations, indulgences, canonizations, annates, the pallia, and investitures of archbishops, bishops, &c.

The pope has a considerable body of regular forces, well clothed and paid; but his fleet consists only of a few galleys. His life-guards are 40 Switzers, 75 cuirassiers, and as many light horse. Since the beginning of this war, we are told, he has likewise had a guard of English horse.

POPERY, in ecclesiastical history, comprehends the religious doctrines and practices adopted and maintained by the church of Rome. The following summary, extracted chiefly from the decrees of the council of Trent, continued under Paul III. Julius III. and Pius IV. from the year 1545 to 1563, by successive sessions, and the creed of pope Pius IV. subjoined to it, and bearing date November 1564, may not be unacceptable to the reader. One of the fundamental tenets, strenuously maintained by popish writers, is the infallibility of the church of Rome; though they are not agreed whether this privilege belongs to the pope or a general council, or to both united; but they pretend that an infallible living judge is absolutely necessary to determine controversies, and to secure peace in the Christian church. However, Protestants allege, that the claim of infallibility in any church is not justified

Pope,
Pope's.

by

Popery.

by the authority of Scripture; much less does it pertain to the church of Rome; and that it is inconsistent with the nature of religion, and the personal obligations of its professors; and that it has proved ineffectual to the end for which it is supposed to be granted, since popes and councils have disagreed in matters of importance, and they have been incapable, with the advantage of this pretended infallibility, of maintaining union and peace.

Another essential article of the popish creed is the supremacy of the pope, or his sovereign power over the universal church. See POPE.

Farther, the doctrine of the seven sacraments is a peculiar and distinguishing doctrine of the church of Rome: these are baptism, confirmation, the eucharist, penance, extreme unction, orders, and matrimony.

The council of Trent (sess. 7. can. 1.) pronounces an anathema on those who say, that the sacraments are more or fewer than seven, or that any one of the above number is not truly and properly a sacrament. And yet it does not appear that they amounted to this number before the 12th century, when Hugo de St Victor and Peter Lombard, about the year 1144, taught that there were seven sacraments. The council of Florence, held in 1438, was the first council that determined this number. These sacraments confer grace, according to the decree of the council of Trent (sess. 7. can. 8.) *ex opere operato*, by the mere administration of them: three of them, viz. baptism, confirmation, and orders, are said (can. 9.) to impress an indelible character, so that they cannot be repeated without sacrilege; and the efficacy of every sacrament depends on the intention of the priest by whom it is administered (can. 11.) Pope Pius expressly enjoins, that all these sacraments should be administered according to the received and approved rites of the Catholic church. With regard to the eucharist in particular, we may here observe, that the church of Rome holds the doctrine of transubstantiation; the necessity of paying divine worship to Christ under the form of the consecrated bread, or host; the propitiatory sacrifice of the mass, according to their ideas of which Christ is truly and properly offered as a sacrifice as often as the priest says mass; it practises likewise solitary mass, in which the priest alone, who consecrates, communicates, and allows communion only in one kind, viz. the bread, to the laity. Sess. 14.

The doctrine of merits is another distinguishing tenet of popery; with regard to which the council of Trent has expressly decreed (sess. 6. can. 32.) that the good works of justified persons are truly meritorious; deserving not only an increase of grace, but eternal life, and an increase of glory; and it has anathematized all who deny this doctrine. Of the same kind is the doctrine of satisfactions; which supposes that penitents may truly satisfy, by the afflictions they endure under the dispensations of Providence, or by voluntary penances to which they submit, for the temporal penalties of sin, to which they are subject, even after the remission of their eternal punishment. Sess. 6. can. 30. and sess. 14. can. 8. and 9. In this connection we may mention the popish distinction of venial and mortal sins: the greatest evils arising from the former are the temporary pains of purgatory; but no man, it is said, can obtain the pardon of the latter without

confessing to a priest, and performing the penances which he imposes.

The council of Trent (sess. 14. can. 1.) has expressly decreed, that every one is accursed, who shall affirm that penance is not truly and properly a sacrament, instituted by Christ in the universal church, for reconciling those Christians to the divine majesty, who have fallen into sin after baptism: and this sacrament, it is declared, consists of two parts, the matter and the form; the matter is the act of the penitent, including contrition, confession, and satisfaction; the form of it is the act of absolution on the part of the priest. Accordingly it is enjoined, that it is the duty of every man, who hath fallen after baptism, to confess his sins once a year, at least, to a priest: that this confession is to be secret; for public confession is neither commanded nor expedient: and that it must be exact and particular, including every kind and act of sin, with all the circumstances attending it. When the penitent has so done, the priest pronounces an absolution; which is not conditional or declarative only, but absolute and judicial. This secret, or auricular confession, was first decreed and established in the fourth council of Lateran, under Innocent III. in 1215, (cap. 21.) And the decree of this council was afterwards confirmed and enlarged in the council of Florence, and in that of Trent; which ordains, that confession was instituted by Christ, that by the law of God it is necessary to salvation, and that it has been always practised in the Christian church. As for the penances imposed on the penitent by way of satisfaction, they have been commonly the repetition of certain forms of devotion, as pater-nosters, or ave-marias, the payment of stipulated sums, pilgrimages, fasts, or various species of corporal discipline. But the most formidable penance, in the estimation of many who have belonged to the Romish communion, has been the temporary pains of purgatory. But under all the penalties which are inflicted or threatened in the Romish church, it has provided relief by its indulgences, and by its prayers or masses for the dead, performed professedly for relieving and rescuing the souls that are detained in purgatory.

Another article that has been long authoritatively enjoined and observed in the church of Rome, is the celibacy of her clergy. This was first enjoined at Rome by Gregory VII. about the year 1074, and established in England by Anselm archbishop of Canterbury about the year 1175; though his predecessor Lanfranc had imposed it upon the prebendaries and clergy that lived in towns. And though the council of Trent was repeatedly petitioned by several princes and states to abolish this restraint, the obligation of celibacy was rather established than relaxed by this council; for they decreed, that marriage contracted after a vow of continence, is neither lawful nor valid; and thus deprived the church of the possibility of ever restoring marriage to the clergy. For if marriage, after a vow, be in itself unlawful, the greatest authority upon earth cannot dispense with it, nor permit marriage to the clergy, who have already vowed continence.

To the doctrines and practices above recited may be farther added the worship of images, of which Protestants accuse the Papists. But to this accusation the Papist replies, that he keeps images by him to preserve
in

Popery.

Papist
Misrepresent-
ed and
Represent-

in his mind the memory of the persons represented by them; as people are wont to preserve the memory of their deceased friends by keeping their pictures. He is taught (he says) to use them so as to cast his eyes upon the pictures or images, and thence to raise his heart to the things represented, and there to employ it in meditation, love, and thanksgiving, desire of imitation, &c. as the object requires.

These pictures or images have this advantage, that they inform the mind by one glance of what in reading might require a whole chapter. There being no other difference between them, than that reading represents leisurely and by degrees; and a picture, all at once. Hence he finds a convenience in saying his prayers with some devout pictures before him, he being no sooner distracted, but the sight of these recalls his wandering thoughts to the right object; and as certainly brings something good into his mind, as an immodest picture disturbs his heart with filthy thoughts. And because he is sensible that these holy pictures and images represent and bring to his mind such objects as in his heart he loves, honours, and venerates; he cannot but upon that account love, honour, and respect, the images themselves.

The council of Trent likewise decreed, that all bishops and pastors who have the cure of souls, do diligently instruct their flocks, *that it is good and profitable to desire the intercession of saints reigning with Christ in heaven.* And this decree the Papists endeavour to defend by the following observations. They confess that we have but one Mediator of redemption; but affirm that it is acceptable to God that we should have many mediators of intercession. Moses (say they) was such a mediator for the Israelites; Job for his three friends; Stephen for his persecutors. The Romans were thus desired by St Paul to be his mediators; so were the Corinthians, so the Ephesians, *Ep. ad Rom. Cor. Eph.* so almost every sick man desires the congregation to be his mediators, by remembering him in their prayers. And so the Papist desires the blessed in heaven to be his mediators; that is, that they would pray to God for him. But between these living and dead mediators there is no similarity: the living mediator is present, and certainly hears the request of those who desire him to intercede for them; the dead mediator is as certainly absent, and cannot possibly hear the requests of all those who at the same instant may be begging him to intercede for them, unless he be possessed of the divine attribute of omnipresence; and he who gives that attribute to any creature is unquestionably guilty of idolatry. And as this decree is contrary to one of the first principles of natural religion, so does it receive no countenance from Scripture, or any Christian writer of the three first centuries. Other practices peculiar to the Papists are the religious honour and respect that they pay to sacred relics; by which they understand not only the bodies and parts of the bodies of the saints, but any of those things that appertained to them, and which they touched; and the celebration of divine service in an unknown tongue: to which purpose the council of Trent hath denounced an anathema on any one who shall say that mass ought to be celebrated only in the vulgar tongue; sess. 25. and sess. 22. can. 9. Though the council of Lateran under Innocent III. in 1215 (can. 9.) had expressly decreed, that because in many

parts within the same city and diocese there are many people of different manners and rites mixed together, but of one faith, the bishops of such cities or dioceses should provide fit men for celebrating divine offices, according to the diversity of tongues and rites, and for administering the sacraments.

We shall only add, that the church of Rome maintains, that unwritten traditions ought to be added to the holy Scriptures, in order to supply their defect, and to be regarded as of equal authority; that the books of the Apocrypha are canonical scripture; that the vulgate edition of the Bible is to be deemed authentic; and that the Scriptures are to be received and interpreted according to that sense which the holy mother church, to whom it belongs to judge of the true sense, hath held, and doth hold, and according to the unanimous consent of the fathers.

Such are the principal and distinguishing doctrines of Popery, most of which have received the sanction of the council of Trent, and that of the creed of pope Pius IV. which is received, professed, and sworn to by every one who enters into holy orders in the church of Rome; and at the close of this creed, we are told that the faith contained in it is so absolutely and indispensably necessary, that no man can be saved without it.

Many of the doctrines of Popery were relaxed, and very favourably interpreted by M. de Meaux, bishop of Condom, in his Exposition of the Doctrine of the Catholic Church, first printed in the year 1671: but this edition, which was charged with perverting, in endeavouring to palliate, the doctrine of the church, was censured by the doctors of the Sorbonne, and actually suppressed; nor does it appear that they ever testified their approbation in the usual form of subsequent and altered editions. It has, however, been lately published in England; by a clergyman of the Romish church, whose integrity, piety, and benevolence, would do honour to any communion.

POPHAM (Sir John), lord chief justice of the common pleas in the reign of Queen Elizabeth, was the eldest son of Edward Popham, Esq; of Huntworth in Somersetshire, and born in the year 1531. He was some time a student of Baliol college in Oxford; "being then (says Ant. Wood) given at leisure hours to many sports and exercises." After quitting the university, he fixed in the Middle Temple; where, during his novitiate, he is said to have indulged in that kind of dissipation to which youth and a vigorous constitution more naturally incline than to the study of voluminous reports: but, satiated at length with what are called the *pleasures of the town*, he applied sedulously to the study of his profession, was called to the bar, and in 1568 became summer or autumn reader. He was soon after made serjeant at law, and solicitor-general in 1579. In 1581, he was appointed attorney-general, and treasurer of the Middle temple. In 1592, he was made lord chief justice of the king's bench, and the same year received the honour of knighthood. In the year 1601, his lordship was one of the council detained by the unfortunate earl of Essex, when he formed the ridiculous project of defending himself in his house: and, on the earl's trial, he gave evidence against him relative to their detention. He died in the year 1607, aged 76; and was buried in

Popery,
Popham.

Ibid.

Poplar || **Populus.** in the south aisle of the church at Wellington in Somersetshire, where he generally resided as often as it was in his power to retire. He was thought somewhat severe in the execution of the law against capital offenders: but his severity had the happy effect of reducing the number of highway robbers. He wrote, 1. Reports and cases adjudged in the time of Queen Elizabeth. 2. Resolutions and judgments upon cases and matters agitated in all the courts at Westminster in the latter end of Queen Elizabeth's reign.

POPLAR, in botany. See **POPULUS**.

POPLITÆUS, in anatomy, a small muscle obliquely pyramidal, situated under the ham. See **ANATOMY**, *Table of the Muscles*.

POPPY, in botany. See **OPIMUM** and **PAPAVER**.

POPULAR, something that relates to the common people.

POPULATION, means the state of a country with respect to the number of people. See *Bills of MORTALITY* and *POLITICAL-ARITHMETIC*.

The question concerning the number of men existing upon earth, has been variously determined by different writers. Riccioli states the population of the globe at 1000 millions, Vossius at 500; the Journalists of Trevoux at 720; and the editor (Xavier de Feller) of the small Geographical Dictionary of Vosgien, reprinted at Paris in 1778, at 370 millions. This last estimate is perhaps too low, although the writer professes to have taken considerable pains to ascertain the point with as much accuracy as the nature of the subject will admit. It may, perhaps, not be deemed unworthy the attention of the curious speculatist to observe, that assuming the more probable statement of the learned Jesuits of Trevoux, and that the world has existed about 6006 years in its present state of population, then the whole number of persons who have ever existed upon earth since the days of Adam amounts only to about one hundred and thirty thousand millions; because $720,000,000 \times 182$ (the number of generations in 6006 years) = 131,040,000,000. See on this subject the authors abovementioned, as likewise Beaufobre's *Etude de la Politique*.

With regard to the population of England, the reader may consult, together with our article *POLITICAL-ARITHMETIC*, An inquiry into the present State of Population, &c. by W. Wales, F. R. S. and Mr Howlett's Examination of Dr Price's Essay, on the same subject.

POPULUS, the **POPLAR**: A genus of the octandria order, belonging to the diœcia class of plants; and in the natural method ranking under the 50th order, *Amentaceæ*. The calyx of the amentum is a lacerated, oblong, and squamous leaf; the corolla is turbinate, oblique, and entire. The female has the calyx of the amentum and corolla the same as in the male; the stigma is quadrifid; the capsule bilocular, with many pappous seeds.

The poplar, one of the most beautiful of the aquatic trees, has frequently been introduced into the poetical descriptions of the ancients; as by Virgil, *Ecl.* vii. 66. ix. 41. *Georg.* ii. 66. iv. 511. *Æn.* viii. 31. 276. by Ovid, *Amom. Parid.* 27. by Horace, *Carm.* ii. 3. and by Catulus, *Nupt. Pil. et Thet.* 290. &c. &c.

Species. 1. The alba, or abele-tree, grows naturally in the temperate parts of Europe. Its leaves are

large, and divided into three, four, or five lobes, indented on their edges, of a very dark colour on their upper side, but very white and downy on the under side; standing upon footstalks an inch long. The young branches have a purple bark, and are covered with a white down; but the bark of the stem and older branches is grey. In the beginning of April, the male flowers or catkins appear, which are cylindrical, and about three inches long. About a week after come out the female flowers or catkins, which have no stamina like those of the male. Soon after these come out, the male catkins fall off; and in five or six weeks after the female flowers will have ripe seeds inclosed in a hairy covering. The catkins will then drop, and the seeds be wafted by the winds to a great distance. 2. The major, or white poplar, has its leaves rounder than the first, and not much above half their size: they are indented on their edges, and are downy on their under side, but not so white as those of the former, nor are their upper surfaces of such a deep green colour. 3. The nigra, or black poplar, has oval heart-shaped leaves, slightly crenated on their edges; they are smooth on both sides, and of a light green colour. 4. The tremula, or aspen-tree, has roundish, angularly indented leaves: they are smooth on both sides, and stand on long footstalks, and so are shaken by the least wind; from whence it has the title of the *trembling poplar*, or *aspen-tree*. 5. The balsamifera, or Carolina poplar, is a native of Carolina, where it becomes a large tree. The shoots of this sort grow very strong in Britain, and are generally angular; with a light green bark like the willow. The leaves on young trees, and also those on the lower shoots, are very large, almost heart-shaped, and crenated; but those upon the older trees are smaller: as the trees advance, their bark becomes lighter, approaching to a greyish colour. 6. The tacamahaca, grows naturally in Canada and other parts of North America. This is a tree of a middling growth, sending out on every side many short thick shoots, which are covered with a light brown bark, garnished with leaves differing from one another in shape and size; most of them are almost heart-shaped; but some are oval, and others nearly spear-shaped; they are whitish on their under side, but green on their upper.

Culture. These trees may be propagated either by layers or cuttings, as also from suckers which the white poplars send up from their roots in great plenty. The best time for transplanting these suckers is in October, when their leaves begin to decay. These may be placed in a nursery for two or three years, to get strength before they are planted out where they are designed to remain; but if they are propagated from cuttings, it is better to defer the doing of that until February, at which time truncheons of two or three feet long should be thrust about a foot and a half into the ground.—These will readily take root; and if the soil in which they are planted be moist, they will arrive at a considerable bulk in a few years. The black poplar is less apt to take root from large truncheons; therefore it is a better method to plant cuttings of it about a foot and a half in length, thrusting them a foot deep in the ground. This sort will grow almost on any soil, but will thrive best in moist places. The Carolina poplar may also be propagated by cuttings or layers; but the last is the method generally practised, and the plants raised

Populus. raised by it are less moist than others. The shoots of this tree, while young, are frequently killed down to a considerable length by the frost in winter; but as the trees grow older, their shoots are not so vigorous, and become more ligneous, so are not liable to the same disaster. But the trees should be planted in a sheltered situation: for as their leaves are very large, the wind has great power over them; and the branches being tender, they are frequently broken or split by the winds in summer, when they are much exposed. The *tacamahaca* sends up a great number of suckers from its roots, by which it multiplies in plenty; and every cutting which is planted will take root.

Uses. The wood of these trees, especially of the *abele*, is good for laying floors, where it will last for many years; and on account of its extreme whiteness is by many preferred to oak; yet, on account of its soft texture, being very subject to take the impression of nails, &c. it is less proper on this account than the harder woods. The *abele* likewise deserves particular notice, on account of the virtue of its bark in curing intermitting fevers. The Reverend Mr Stone, in Phil. Transf. vol. LIII. p. 195. tells us, that he gathers the bark in summer when it is full of sap, and having dried it by a gentle heat, gives a dram powdered every four hours betwixt the fits. In a few obstinate cases, he mixed one-fifth part of Peruvian bark with it. It is remarkable how nature has adapted remedies to diseases. Intermitting fevers are most prevalent in wet countries; and this tree grows naturally in such situations. The bark of it is an object well worthy the attention of physicians; and if its success upon a more enlarged scale of practice prove equal to Mr Stone's experiments, the world will be much indebted to him for communicating them. This bark will also tan leather.

The inner bark of the black poplar is used by the inhabitants of Kamtschatka as a material for bread; and paper has sometimes been made of the cottony down of the seeds. The roots have been observed to dissolve into a kind of gelatinous substance, and to be coated over with a tubular crustaceous spar, called by naturalists *osella**, formerly imagined to have some virtue in producing the callus of a fractured bone. The buds of the sixth species are covered with a glutinous resin, which smells very strong, and is the gum *tacamahaca* of the shops. The best, called, from its being collected in a kind of gourd shells, *tacamahaca in shells*, is somewhat unctuous and softish, of a pale yellowish or greenish colour, an aromatic taste, and a fragrant delightful smell, approaching to that of lavender or ambergris. This sort is very rare; that commonly found in the shops is in semitransparent globes or grains, of a whitish, yellowish, brownish, or greenish colour, of a less grateful smell than the foregoing. This resin is said to be employed externally by the Indians for discussing and maturing tumours, and abating pains in the limbs. It is an ingredient in some anodyne, hysseric, cephalic and stomachic plasters; but the fragrance of the finer sort sufficiently points out its utility in other respects.

M. Fougereux de Bondaroy, from a set of experiments
VOL. XV.

on the subject, gives an account of the uses of the several kinds of poplar, the substance of which is as follows: He finds that the wood of the black poplar is good and useful for many purposes; that the Lombardy poplar, *populus fastigata*, is of very little value; that the Virginia poplar, *populus Virginiana*, affords a wood of excellent quality, that may be applied to many uses. The Carolina poplar, *populus Carolinensis*—*leucorophylla*, (Linn.) is a very quick grower; beautiful when found, but liable to be hurt by cold. Its wood appeared to M. de Bondaroy to be of little value; but M. Maleherbe, who cut down a large tree of this sort, was assured by his carpenter that the wood was very good.—That the *tacamahaca*, *populus tacamahaca balsamifera*, is a dwarfish plant (A), of little value.—That the liard, *populus Canadensis*, is a large tree, the wood light, not easy to be split, and fit for several uses.—That the white poplar, *populus alba*, is a large growing tree, affording a wood of excellent quality, and is among the most valuable of this species.—That the trembling poplar, *populus tremula*, (Linn.) is neither so large a tree nor affords such wood as the former. These are in few words the principal result of the experiments of this gentleman on this class of plants. A few other sorts are mentioned, but nothing decisive with regard to them is determined.

From some experiments made by M. Dambourney, it appears that the poplar may be usefully employed in dyeing. The Italian poplar gives a dye of as fine a lustre, and equally durable, as that of the finest yellow wood, and its colour is more easily extracted. It is likewise very apt to unite with other colours in composition. Besides the *populus fastigata*, M. Dambourney tried also the black poplar, the Virginian *ditto*, the balsam *ditto* or liard, the white *ditto*, and the trembling poplar; and found that all these dyed wool of a nut-colour, fawn-colour (*vigayne*), Nankin, mulk, and other grave shades, according to the quantity of wood employed, and the length of time it was boiled.

POQUELIN or POCQUELIN (John Baptist.) See MOLIERE.

PORANA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. The corolla is campanulated; the calyx is quinquefid, and larger than the fruit; the style semibifid, long, and permanent; the stigmata globular; the perianthium bivalved.

PORCELAIN, a fine kind of earthen ware, chiefly manufactured in China, and thence called *China-ware*. All earthen wares which are white and semitransparent are generally called *porcelains*: but amongst these, so great differences may be observed, that, notwithstanding the similarity of their external appearance, they cannot be considered as matters of the same kind. These differences are so evident, that even persons who are not connoisseurs in this way prefer much the porcelain of some countries to that of others.

The word *porcelain* is of European derivation; none of the syllables which compose it can even be pronounced or written by the Chinese, whose language comprehends

Populus
||
Porcelain

* See *Osella*.

(A) We have seen it above 30 feet high.

Porcelain. prehends no such sounds. It is probable that we are indebted to the Portuguese for it: the word *porcellana*, however, in their language, signifies properly a cup or dish; and they themselves distinguish all works of porcelain by the general name of *loca*. Porcelain is called in China *tse-ki*. **Porcelain.**

3 **Art of making it in greater perfection in the East than in Europe.** The art of making porcelain is one of those in which Europe has been excelled by oriental nations. The first porcelain that was seen in Europe was brought from Japan and China. The whiteness, transparency, fineness, neatness, elegance, and even the magnificence of this pottery, which soon became the ornament of sumptuous tables, did not fail to excite the admiration and industry of Europeans; and their attempts have succeeded so well, that in different parts of Europe earthen wares have been made so like the oriental, that they have acquired the name of *porcelain*. The first European porcelains were made in Saxony and in France; and afterwards in England, Germany, and Italy: but as all these were different from the Japanese, so each of them had its peculiar character.

4 **Best Chinese porcelain at King-te-tching.** The finest and best porcelain of China is made in a village called *King-te-tching*, in the province of Kiang-si. This celebrated village is a league and a half in length, and we are assured that it contains a million of inhabitants. The workmen of King-te-tching, invited by the attracting allurements of the European trade, have established manufactories also in the provinces of Fokien and Canton; but this porcelain is not esteemed.—The emperor Kang-hi was desirous of having some made under his own inspection at Pe-king. For this purpose he collected workmen, together with tools, and all materials necessary; furnaces were also erected, but the attempt miscarried. The village of *King-te-tching* still continues the most celebrated place in the empire for beautiful porcelain, which is transported to all parts of the world, and even to Japan.

5 **Origin of the art.** We are unable to discover who first found out the art of making porcelain, nor is it known whether the Chinese were indebted to chance for it, or to the repeated efforts of inventive genius; we cannot even determine its antiquity with precision; we know only from the annals of Feou-leang, a city in the district to which King-te-tching belongs, that, since the year 442 of our era, the workmen of this village have always furnished the emperors with porcelain; and that one or two mandarins were sent from court to inspect their labours. It is, however, supposed that the invention of porcelain is much older than that epocha.

6 **F. d'Entrecolles first gave an account of Chinese porcelain.** We are indebted to Father d'Entrecolles, a Romish missionary, for a very accurate account of the manner in which porcelain is made in China; and as he lived in King-te-tching, his information must have been the very best possible. We shall therefore give his account of the Chinese manner of making it, as abridged by Grozier in his *General Description of China*. The principal ingredients of the fine porcelain are *pe-tun-tse* and *kao-lin*, two kinds of earth from the mixture of which the paste is produced. The *kao-lin* is intermixed with small shining particles; the other is purely white, and very fine to the touch. These first materials are carried to the manufactories in the shape of bricks. The *pe-tun-tse*, which is so fine, is nothing else but fragments of rock taken from certain quarries, and reduced to powder. Every kind of stone is not fit for this purpose. The colour

of that which is good, say the Chinese, ought to incline a little towards green. A large iron club is used for breaking these pieces of rock: they are afterwards put into mortars; and, by means of levers headed with stone bound round with iron, they are reduced to a very fine powder. These levers are put in action either by the labour of men, or by water, in the same manner as the hammers of our paper-mills. The dust afterwards collected is thrown into a large vessel full of water, which is strongly stirred with an iron shovel. When it has been left to settle for some time, a kind of cream rises on the top, about four inches in thickness, which is skimmed off, and poured into another vessel filled with water: the water in the first vessel is stirred several times; and the cream which arises is still collected, until nothing remains but the coarse dregs, which, by their own weight, precipitate to the bottom: these dregs are carefully collected, and pounded anew.

With regard to what is taken from the first vessel, it is suffered to remain in the second until it is formed into a kind of crust at the bottom. When the water above it seems quite clear, it is poured off by gently inclining the vessel, that the sediment may not be disturbed; and the paste is thrown into large moulds proper for drying it. Before it is entirely hard, it is divided into small square cakes, which are sold by the hundred. The colour of this paste, and its form, have occasioned it to receive the name of *pe-tun-tse*.

The *kao-lin*, which is used in the composition of porcelain, requires less labour than the *pe-tun-tse*. Nature has a greater share in the preparation of it. There are large mines of it in the bosoms of certain mountains, the exterior strata of which consist of a kind of red earth. These mines are very deep, and the *kao-lin* is found in small lumps, that are formed into bricks after having gone through the same process as the *pe-tun-tse*. Father d'Entrecolles thinks, that the earth called *terre de Malte*, or St Paul's earth, has much affinity to the *kao-lin*, although those small shining particles are not observed in it which are interspersed in the latter.

It is from the *kao-lin* that fine porcelain derives all its strength; if we may be allowed the expression, it stands it instead of nerves. It is very extraordinary, that a soft earth should give strength and consistency to the *pe-tun-tse*, which is procured from the hardest rocks. A rich Chinese merchant told F. d'Entrecolles, that the English and Dutch had purchased some of the *pe-tun-tse*, which they transported to Europe with a design of making porcelain; but having carried with them none of the *kao-lin*, their attempt proved abortive, as they have since acknowledged. "They wanted (said this Chinese, laughing) to form a body, the flesh of which would support itself without bones."

8 **The Chinese have discovered, within these few years, a new substance proper to be employed in the composition of porcelain.** A new substance discovered and used by the Chinese. It is a stone, or rather species of chalk, called *hoa-che*, from which the physicians prepare a kind of draught that is said to be detensive, aperient, and cooling. The manufacturers of porcelain have thought proper to employ this stone instead of *kao-lin*. It is called *hoa*, because it is glutinous, and has a great resemblance to soap. Porcelain made with *hoa-che* is very rare, and much dearer than any other. It has an exceeding fine grain, and, with regard to the painting, if it be compared with that of the common porcelain, it

Porcelain. it appears to surpass it as much as vellum does paper. This porcelain is, besides, so light, that it surprises those who are accustomed to handle other kinds; it is also much more brittle; and it is very difficult to hit upon the proper degree of tempering it.

Hoa-che is seldom used in forming the body of the work; the artist is contented sometimes with making it into a very fine size, in which the vessel is plunged when dry, in order that it may receive a coat before it is painted and varnished: by these means it acquires a superior degree of beauty.

When hoa-che is taken from the mine, it is washed in rain or river water, to separate it from a kind of yellow earth which adheres to it. It is then pounded; put into a tub filled with water to dissolve it, and afterwards formed into cakes like kao-lin. We are assured that hoa-che, when prepared in this manner, without the mixture of any other earth, is alone sufficient to make porcelain. It serves instead of kao-lin; but it is much dearer. Kao-lin costs only ten-pence Sterling; the price of hoa-che is half-a-crown: this difference, therefore, greatly enhances the value of porcelain made with the latter.

9
The splendor and whiteness of their porcelain derived from oil or varnish.

To pe-tun-tse and kao-lin, the two principal elements, must be added the oil or varnish from which it derives its splendor and whiteness. This oil is of a whitish colour, and is extracted from the same kind of stone which produces the pe-tun-tse, but the whitest is always chosen, and that which has the greenest spots. The oil is obtained from it by the same process used in making the pe-tun-tse: the stone is first washed and pulverized; it is then thrown into water, and after it has been purified it throws up a kind of cream. To 100 pounds of this cream is added one pound of che-kao, a mineral something like alum, which is put into the fire till it becomes red-hot and then pounded. This mineral is a kind of runnet, and gives a consistence to the oil, which is however carefully preserved in its state of fluidity. The oil thus prepared is never employed alone, another oil must be mixed with it, which is extracted from lime and fern ashes, to 100 pounds of which is also added a pound of che-kao. When these two oils are mixed, they must be equally thick; and in order to ascertain this, the workmen dip into each of them some cakes of the pe-tun-tse, and by inspecting their surfaces closely after they are drawn out, thence judge of the thickness of the liquors. With regard to the quantity necessary to be employed, it is usual to mix 10 measures of stone-oil with one measure of the oil made from lime and fern ashes.

10
Their mode of mixing the substances.

The first labour consists in again purifying the pe-tun-tse and the kao-lin. The workmen then proceed to mix these two substances together. For fine porcelain they put an equal quantity of the kao-lin and the pe-tun-tse; for the middling sort they use four parts of the kao-lin and six of the pe-tun-tse. The least quantity put of the former is one part to three of the pe-tun-tse. When this mixture is finished, the mass is thrown into a large pit, well paved and cemented in every part; it is then trod upon, and kneaded until it becomes hard. This labour is so much the more fatiguing, as it must be continued with ut intermission: were it interrupted, all the other labourers would remain unemployed. From this mass, thus prepared, the workmen detach different pieces, which they spread out

upon large slates, where they knead and roll them in every direction, carefully observing to leave no vacuum in them, and to keep them free from the mixture of any extraneous body. A hair or a grain of sand would spoil the whole work. When this paste has not been properly prepared, the porcelain cracks, and melts or becomes warped.

All plain works are fashioned with the wheel. When a cup has undergone this operation, the outside of its bottom is quite round. The workman first gives it the requisite height and diameter, and it comes from his hands almost the moment he has received it. He is under the necessity of using expedition, as he is paid not quite a farthing per board, and each board contains 26 pieces. This cup passes then to a second workman, who forms its base. A little after it is delivered to a third, who applies it to his mould, and gives it a proper form; when he takes it off the mould, he must turn it very softly, and be careful not to press it more on one side than on another; without this precaution it would become warped or disfigured. A fourth workman polishes it with a chisel, especially around the edges, and diminishes its thickness, in order to give it a certain degree of transparency. At length, after having passed through all the hands necessary for giving it all its ornaments, it is received, when dry, by the last workman, who fashions its bottom with a chisel. It is astonishing to see with what dexterity and expedition the workmen convey these vases from one to another. We are assured, that a piece of porcelain, before it is finished, must pass through the hands of 70 persons.

11
And of fashioning the works.

Large works are executed in parts which are fashioned separately. When all the pieces are finished, and almost dry, they are put together and cemented with paste made of the same substance, and softened with water. Some time after, the seams are polished with a knife, both without and within; and when the vessel is covered with varnish, it entirely conceals them, so that the least trace of them is not to be seen. It is in this manner that spouts, handles, rings, and other parts of the same nature, are added. This is the case, particularly in those pieces which are fashioned upon moulds or modelled with the hands, such as embossed works, grotesque images, idols, figures of trees or animals, and busts, which the Europeans order. All these are formed of four or five pieces joined together, which are afterwards brought to perfection with instruments proper for carving, polishing, and finishing, the different traces which the mould has left imperfect. With regard to those flowers and ornaments which are not in relief, they are either engraven or imprinted with a stamp. Ornaments in relief prepared separately, are also added to pieces of porcelain, almost in the same manner as lace is put upon a coat.

12
Large works executed in parts and cemented.

After a piece of porcelain has been properly fashioned, it then passes into the hands of the painters. These hoa-pei, or painters in porcelain, are equally indigent as the other workmen; they follow no certain plan in their art, nor are they acquainted with any of the rules of drawing; all their knowledge is the effect of practice, assisted by a whimsical imagination. Some of them, however, show no inconsiderable share of taste in painting flowers, animals, and landscapes, on porcelain, as well as upon the paper of fans, and the silk used for filling up the squares of lanterns. The labour of painting,

13
Their manner of painting porcelain.

Porcelain. in the manufactories of which we have spoken, is divided among a great number of hands. The business of one is entirely confined to tracing out the first coloured circle, which ornaments the brims of the vessel; another designs the flowers, and a third paints them; one delineates waters and mountains, and another birds and other animals: human figures are generally the worst executed.

14 And of making it appear covered with veins. The *tou-you*, which is a kind of oil procured from white flint, has the peculiar property of making those pieces of porcelain upon which it is laid appear to be covered with an infinitude of veins in every direction; at a distance one would take them for cracked vases, the fragments of which have not been displaced. The colour communicated by this oil is a white, somewhat inclining to that of ashes. If it be laid upon porcelain, entirely of an azure blue, it will appear in the same manner to be variegated with beautiful veins. This kind of porcelain is called *tou-ki*.

25 A singular secret which they have now lost. The Chinese make vases also ornamented with a kind of fret-work, perforated in such a manner as to resemble very fine lace. In the middle is placed a cup proper for holding any liquid; and this cup makes only one body with the former, which appears like lace wrapped round it. The Chinese workmen had formerly the secret of making a still more singular kind of porcelain: they painted upon the sides of the vessel fishes, insects, and other animals, which could not be perceived until it was filled with water. This secret is in a great measure lost: the following part of the process is, however, preserved. The porcelain, which the workman intends to paint in this manner, must be extremely thin and delicate. When it is dry the colour is laid on pretty thick, not on the outside, as is generally done, but on the inside. The figures painted upon it, for the most part, are fishes, as being more analogous to the water with which the vessel is filled. When the colour is thoroughly dry, it is coated over with a kind of size, made from porcelain-earth; so that the azure is entirely inclosed between two laminæ of earth. When the size becomes dry, the workmen pours some oil into the vessel, and afterwards puts it upon a mould and applies it to the lath. As this piece of porcelain has received its confistence and body within, it is made as thin on the outside as possible, without penetrating to the colour; its exterior surface is then dipped in oil, and when dry it is baked in a common furnace. The art of making these vases requires the most delicate care, and a dexterity which the Chinese perhaps do not at present possess. They have, however, from time to time made several attempts to revive the secret of this magic painting, but their success has been very imperfect. This kind of porcelain is known by the name of *kia-ling*, "pressed azure."

16 Their mode of baking porcelain. After the porcelain has received its proper form, its colours, and all the intended ornaments, it is transported from the manufactory to the furnace, which is situated sometimes at the other end of King-te-ching. In a kind of portico, which is erected before it, may be seen heaps of boxes and cases made of earth, for the purpose of inclosing the porcelain. Each piece, however inconsiderable it may be, has its case; and the Chinese workman, by this procedure, imitates nature, which, in order to bring the fruits of the earth to proper maturity, clothes them in a covering, to defend them from the

excessive heat of the sun during the day, and from the severity of the cold during the night.

In the bottom of these boxes is put a layer of fine sand, which is covered over with powder of the kao-*lin*, to prevent the sand from adhering too closely to the bottom of the vessel. The piece of porcelain is then placed upon this bed of sand, and pressed gently down, in order that the sand may take the form of the bottom of the vessel, which does not touch the sides of its case: the case has no cover. A second, prepared in the same manner, and containing its vessel, is fitted into the first, so that it entirely shuts it, without touching the porcelain which is below; and thus the furnace is filled with piles of cases, which defend the pieces they contain from the too direct action of the fire.

With regard to small pieces of porcelain, such as tea-cups, they are inclosed in common cases about four inches in height. Each piece is placed upon a saucer of earth about twice as thick as a crown-piece, and equal in breadth to its bottom. These small bases are also sprinkled over with the dust of the kao-*lin*. When the cases are large, the porcelain is not placed in the middle, because it would be too far removed from the sides, and consequently from the action of the fire.

These piles of cases are put into the furnace, and placed upon a bed of coarse sand, half a foot in thickness; those which occupy the middle space are at least seven feet high. The two boxes which are at the bottom of each pile remain empty, because the fire acts too feebly upon them, and because they are partly covered by the sand. For the same reason, the case placed at the top of each pile is also suffered to be empty. The piles which contain the finest porcelain are placed in the middle part of the furnace, the coarsest are put at its farther extremity; and those pieces which have the most body and the strongest colouring are near its mouth.

These different piles are placed very closely in the furnace; they support each other mutually by pieces of earth, which bind them at the top, bottom, and middle; but in such a manner that a free passage is left for the flame to insinuate itself everywhere around them.

17 Nature of their furnace. Before each of these furnaces for baking porcelain there is a long porch, which conveys air, and supplies in certain respects the place of a bellows. It serves for the same purposes as the arch of a glasshouse. "These furnaces (says Father d'Entrecolles), which were formerly only six feet in height and the same in length, are constructed now upon a much larger plan: at present they are two fathoms in height, and almost four in breadth; and the sides and roof are so thick, that one may lay the hand upon them without being incommoded by the heat. The dome or roof is shaped like a funnel, and has a large aperture at the top, through which clouds of flame and smoke incessantly issue. Besides this principal aperture, there are five others smaller, which are covered with broken pots, but in such a manner that the workman can increase or diminish the heat according as it may be found most convenient: through these also he is enabled to discover when the porcelain is sufficiently baked. Having uncovered that hole which is nearest the principal aperture, he takes a pair of pincers, and opens one of the cases: if he observes a bright fire in the furnace, if all the cases be red-

Porcelain. red-hot, and if the colours of the porcelain appear with full lustre, he judges that it is in a proper state; he then discontinues the fire, and entirely closes up the mouth of the furnace for some time. In the bottom of the furnace there is a deep hearth about two feet in breadth, over which a plank is laid, in order that the workman may enter to arrange the porcelain. When the fire is kindled on this hearth, the mouth of the furnace is immediately closed up, and an aperture is left only sufficient for the admission of faggots about a foot in length, but very narrow. The furnace is first heated for a day and night; after which two men keep continually throwing wood into it, and relieve each other by turns: 180 loads are generally consumed for one baking. As the porcelain is burning hot, the workman employs for the purpose of taking it out long scarfs or pieces of cloth, which are suspended from his neck."

18
Their different classes of porcelain.

The Chinese divide their porcelain into several classes, according to its different degrees of fineness and beauty. The whole of the first is reserved for the emperor. None of these works ever come into the hands of the public, unless they have blemishes or imperfections which render them unworthy of being presented to the sovereign. It is much to be doubted whether any of the largest and finest porcelain of China has ever been brought to Europe; the missionaries at least assure us that none of that kind is sold at Canton. The Chinese set some value upon the Dresden porcelain, and still more upon that which comes from the manufactories of France.

19
Porcelain first examined scientifically by Reaumur.

The illustrious Reaumur first attended to the manufacture of porcelain as a science, and communicated his researches in two memoirs before the Academy of Sciences in 1727 and 1729. He did not satisfy himself with considering the external appearance, the painting and gilding, which are only ornaments not essential to the porcelain, but he endeavoured to examine it internally; and having broken pieces of the Japanese, Saxon, and French porcelains, he examined the difference of their grains (which name is given to their internal structure). The grain of the Japanese porcelain appeared to him to be fine, close, compact, moderately smooth, and somewhat shining. The grain of the Saxon porcelain was found to be still more compact, not granulous, smooth, shining like enamel. Lastly, the porcelain of St Cloud had a grain much less close and fine than that of Japan; not, or but little, shining; and resembling the grain of sugar.

20
Different kinds of it.

From these first observations Mr Reaumur perceived that porcelains differed considerably. That he might examine them further, he exposed them to a violent heat. More essential differences than these of the grain appeared upon this trial; for the Japanese porcelain was unalterable by the fire, and all the European were melted.

21
Its true composition discovered by Reaumur.

This essential difference betwixt the Japanese and European porcelains suggested to Mr Reaumur a very ingenious thought, and in many respects true, concerning the nature of porcelain in general. As all porcelains somewhat resemble glass in consistence and transparency, though they are less compact and much less transparent, Mr Reaumur considered them as semivitrifications. But every substance may appear, and may actually be, in a semivitrified state in two ways: for, first,

it may be entirely composed of vitrifiable or fusible matters; and in this case, by exposing it to the action of fire, it will be actually melted or vitrified, if the heat be sufficiently strong and long continued. But as this change is not made instantly especially when the heat is not very violent; and as it passes through different stages or degrees, which may be more easily observed as the heat is better managed: hence, by stopping in proper time the application of heat to porcelain made in this manner, we may obtain it in an intermediate state betwixt those of crude earths and of completely vitrified substances, and also possessed of the semitransparency and of the other sensible qualities of porcelain. We know also, that if such porcelain be exposed to a stronger degree of heat, it will then be completely fused and entirely vitrified. But the European porcelains tried by Mr Reaumur had this fusibility; from which he concluded, that their composition is founded upon the abovementioned principle.

In the second place a paste of porcelain may be composed of fusible and vitrifiable matter, mixed with a certain proportion of another matter which is absolutely unfusible in the fires of our furnaces. We may easily perceive, that if such a mixture be exposed to a heat sufficient to melt entirely the vitrifiable ingredient, that this matter will actually melt: but as it is intermixed with another matter which does not melt, and which consequently preserves its consistency and opacity, the whole must form a compound partly opaque and partly transparent, or rather a semitransparent mass; that is, a semivitrified substance or porcelain, but of a kind very different from the former; for as the fusible part of this latter has produced all its effect, and as it has been as much fused as it can be during the baking of the porcelain, the compound may be exposed a second time to a more violent fire, without approaching nearer to a complete vitrification, or without departing from its state of porcelain. But as oriental porcelain has precisely these appearances and properties, Mr Reaumur concludes with reason, that it is composed upon this principle; and he afterwards confirmed his opinion by undeniable facts.

Mr Reaumur examined the pe-tun-tse and kao-lin of the Chinese, and having exposed them separately to a violent fire, he discovered that the pe-tun-tse had fused without addition, and that the kao-lin had given no sign of fusibility. He afterwards mixed these matters, and formed cakes of them, which by baking were converted into porcelain similar to that of China. Mr Reaumur easily found, that the pe-tun-tse of the Chinese was a hard stone of the kind called *vitrifiable*, but much more fusible than any of those which were known in Europe; and that the kao-lin was a talky matter, reduced to a very fine powder. From that time he hoped to make a porcelain of the same kind as the Chinese with materials found in France. Whether he could not find any materials equal to those of China, particularly that material analogous to the pe-tun-tse of the Chinese, or because other occupations prevented the continuance of his researches, we do not know; but we find, from his second memoir upon porcelain that he afterwards attempted to make an artificial pe-tun-tse, by mixing our vitrifiable stones with salts capable of rendering them fusible, or even by substituting for it glass ready formed, and by adding to these such substances

Porcelain.

stances as he thought might be substituted for kao-lin. But he probably found he could not execute these intentions; for he did not resume this subject from the year 1729 to 1739, when he gave a process for converting common glass to a singular kind of porcelain, to which he had given his name, and of which an account is given under CHEMISTRY, n° 591—594. See also the article *GLASS-Porcelain*.

Although Mr Reaumur has surmounted many difficulties, and has given just notions concerning this subject, yet he has been mistaken, or rather misled, in two important points. His first error concerns the Saxon porcelains which he confounds with the other fusible porcelains made in Europe. Formerly, indeed a porcelain might be made in Saxony, composed entirely of fusible or vitrifiable materials, the vitrification of which was stopt in proper time, and which Mr Reaumur had examined. But now we are certainly informed, that all of that country is capable of resisting the most violent fires without fusion, as well at least as those of China and Japan. Mr Reaumur might have been misled by the appearance of the internal texture of this porcelain. For when a piece of it is broken, its internal surface does not appear granulous, but compact, uniform, smooth, shining, and much resembling white enamel. But this appearance, so far from showing that Saxon porcelain is a fused or vitrified substance, proves that it is not entirely composed of fusible matters. All who have considered attentively this subject know, that the internal surface of the most fusible porcelains is also the least dense and least compact; the reason of which is, that no vitreous matter can be smooth and dense internally, unless it has been completely fused. But if the density and shining appearance of the internal surface of the Saxon porcelain were only the effects of the fusion of a vitreous matter, how could we conceive that vessels formed of that matter should have sustained the necessary fusion for giving this density and shining appearance, without having entirely lost their shape? The impossibility of this is evident to any persons who have been conversant in these matters and in the fusion of glass.

This quality of the Saxon porcelain must therefore proceed from another cause. It does indeed contain, as every porcelain does, particularly those of China and Japan, a fusible substance, which has been even completely fused during the baking. Its density also, and its internal lustre, proceed chiefly from this fused matter: but we are also certain, that it contains a large quantity of a substance absolutely unfusible, from which it receives its admirable whiteness, its firmness and solidity, during the baking; in a word, which supplies the place of the oriental kao-lin, and which has the property of contracting its dimensions considerably while it incorporates with the fusible substance. If it be subjected to the most decisive trial, namely, the action of a violent fire, capable of melting every porcelain composed of fusible matters alone, "I affirm (says Mr Macquer), after many experiments, that it cannot be fused, unless by a fire capable also of melting the best Japanese porcelain." The Saxon porcelain is therefore not to be confounded with those which are vitreous and fusible; but is in its kind as excellent as that of Japan, and perhaps superior, as we shall see when we enumerate the qualities which constitute the excellence of porcelain. The subject of Mr Reaumur's second error, or at least that which he has not sufficiently explained, is the kao-lin of China. According to him, this matter is a fine talky powder, from the mixture of which with pe-tun-tse the oriental porcelain is formed. Possibly a very finely ground talky substance mixed with pe-tun-tse might form a porcelain similar to the oriental; but persons acquainted with the manufacture of any porcelain must perceive the impossibility of forming vessels, unless the paste of which they are made be so ductile and tenacious that it may be worked upon a potter's lathe, or at least that it may be moulded. But talks, or any kinds of stones, however finely ground, cannot acquire the requisite tenacity, which clays only, of all known earthy substances, possess. The Chinese porcelain vessels evidently appear to be turned upon the lathe, since they retain the marks of it: hence they must have been formed of a very tenacious paste, and consequently the kao-lin is not a purely talky matter, but is mixed with clay; or else the pe-tun-tse and kao-lin are not, as Mr Reaumur supposes, the only ingredients of which Chinese porcelain is formed, but a sufficient quantity of some binding matter, unknown to Father d'Entrecolles and Mr Reaumur, must be also added.

Although, since Mr Reaumur, no scientific person has written concerning porcelain, many have attempted to make it. Manufactories have been established in almost all the states of Europe. Besides that of Saxony, which has been long established, porcelain is also made at Vienna, at Frankendal, and lately in the neighbourhood of Berlin. All these German porcelains are similar to the Saxon; and are made of materials of the same kind, although they differ somewhat from each other. England and Italy also have their porcelains, the chief of which are those of Chelsea and of Naples. M. de la Condamine, in his last journey into Italy, visited a manufacture of porcelain established at Florence by the marquis de la Ginori, then governor of Leghorn. M. de la Condamine observed particularly the large size of some pieces of this porcelain. He says he saw statues and groups half as large as nature, modelled from some of the finest antiques. The furnaces in which the porcelain was baked were constructed with much art, and lined with bricks made of the porcelain materials. The paste of this porcelain is very beautiful; and from the grain of broken pieces, it appears to have all the qualities of the best Chinese porcelain. A whiter glazing would be desirable, which they might probably attain, if the Marquis Ginori was not determined to use those materials only which were found in that country.

But in no state of Europe have such attempts been made to discover porcelain, or so many manufactories of it been established, as in France. Before even Mr Reaumur had published on this subject, porcelain was made at St Cloud, and in the suburb of St Antoine at Paris, which was of the vitreous and fusible kind, but considerably beautiful. Since that time, considerable manufactories of it have been established, at Chantilly, at Villeroy, and at Orleans; the porcelains of which have a distinguished merit. But the porcelain produced in the manufacture at Sevres holds at present the first rank from its shining white, its beautiful glazing, and coloured grounds, in which no porcelain has

Porcelain.

Porcelain has ever equalled it. The magnificence of the gilding, the regularity and elegance of its forms, surpass every thing of the kind.

26
M. Guettard's discoveries.

Mr Guettard has published an account of his discoveries on this subject, in the Memoirs of the Academy of Sciences for the year 1765. The kao-lin which he employed was a white argillaceous earth, filled with mica, which he found in the neighbourhood of Alençon; and his pe-tun-tse is a hard, quartzose, grit stone, found abundantly in the same country, with which the streets of Alençon are paved. We also know that Mr Guettard had begun to make his experiments on porcelain with these materials in the year 1751, together with the then Duke of Orleans, to whom he was attached. The Count de Lauraguais, of the Academy of Sciences, engaged in the pursuit of porcelain for several years with uncommon ardour and constancy. He spared no trouble nor expence to attain his purpose, which was to make porcelain equal in all respects to that of China and Japan. He showed some pieces made by him in the year 1766 to the members of the Academy of Sciences. The persons appointed by them to examine it gave their opinion, "that of all the porcelains made in the country, that of the Count de Lauraguais most resembles the porcelain of China and Japan in solidity, grain, and unfusibility." It were to be wished that it possessed equally the other qualities essential to the excellence of porcelain, namely, the whiteness and lustre observable in the ancient Japanese porcelain.

27
In what the perfection of porcelain consists.

We shall now show what those qualities are which constitute the perfection of porcelain. We must first carefully distinguish the qualities which only contribute to the beauty and external appearance, from the intrinsic and essential properties in which the goodness and solidity of porcelain consist. All persons who have made experiments in this way have soon discovered the possibility of making compounds very white, beautifully semi-transparent, and covered with a shining glazing; but which cannot be worked for want of tenacity, are not sufficiently compact, are essentially fusible, are subject to break by sudden application of heat and cold; and, lastly, the glazing of which cracks, becomes rough, and consequently loses its lustre by use, because it is too soft.

On the other side, we shall also find it not difficult to compose very tenacious pastes which shall be capable of being easily worked and well baked; which in the baking shall acquire the desirable hardness and density; which are unfusible, and capable of sustaining very well the sudden change of heat and cold; and, in a word, which shall have all the qualities of the most excellent porcelain excepting whiteness and beauty. We shall soon see that the materials fit for the composition of such porcelains may be found abundantly in every country. The only difficulty, then, in this inquiry concerning porcelain, is to unite beauty and goodness in one composition; and indeed nature seems to be very sparing of materials fit for this purpose, and therefore perfect porcelain will always be a dear and valuable commodity.

28
Stone-ware a kind of porcelain.

Those potteries which we call *stone-ware* are not of modern invention, and have all the essential qualities of the best Japanese. For if we except whiteness, on which alone the semi-transparency depends, and compare all the properties of Japanese porcelain with those of the

stone-ware, no difference can be found betwixt them. The same grain appears internally in both; the same found is produced by striking them when properly suspended; the same density, the same hardness by which they strike fire with steel, the same faculty of sustaining the heat of boiling liquors without breaking, and the same unfusibility in fire, are observable. Lastly, if the earths of which stone-ware is made were free from heterogeneous colouring matters, which prevent their whiteness and semi-transparency; if vessels were carefully formed; if all the proper attentions were given; and if these vessels were covered over with a fine glazing—they would be as perfect porcelain as that of Japan. The most perfect porcelain, therefore, is nothing else than a fine white stone-ware.

Earths of this kind are probably more rare in Europe than in Japan and China. And probably also the want of these earths was the cause that the first makers of porcelain in Britain confined themselves to an external imitation, by employing nothing but vitrifiable matters with fusible salts and a small quantity of white earth, from which fusible and vitreous porcelains were composed, which might be called *false porcelains*. But things are much changed since these first attempts. Besides the discoveries of the Count de Lauraguais and of Mr Guettard, genuine white porcelains have been made a long time ago in Germany, especially in Saxony and at Frankendal.

These porcelains are not inferior in any respect to the oriental; they are even much superior in beauty and whiteness to the modern oriental porcelain, which has much degenerated in these respects; they seem even to excel the oriental in the most valuable quality of porcelain, namely, the property of sustaining the sudden change of heat and cold. We cannot judge of the quality of porcelain by a slight trial: for so many circumstances concur to make a piece of porcelain capable or incapable of sustaining the sudden application of heat and of cold, that if at the same time boiling water be poured into two vessels, one of which is good porcelain and the other bad, the former may possibly break and the latter remain entire. The only true method of discovering good porcelain in this respect is, to examine several pieces of it which are daily used; for instance, a set of coffee-cups. But it has been observed, that in many such pieces of oriental porcelain, which have been long and daily used, cracks in the direction of their height may be always perceived, which are never seen in the good European porcelains.

Every one talks of porcelain, and yet few are connoisseurs of it. None can be considered as such but those who have long made it an object of their inquiries. That the ancient Japanese porcelain is the most perfect is a general opinion. This porcelain is indeed very beautiful, and we must also acknowledge that its quality is excellent. It has been the British model, and has long been the object of their admiration and emulation; but which they have been never able to equal, and which many persons believe never can be equalled. Some persons even decry the Saxon porcelain for a quality which really gives it a superiority to the Japanese, namely, the greater smoothness, lustre, and less granulous appearance of its internal surface than the oriental. The resemblance of this surface to that of glass has evidently suggested this notion; and it would be well founded if the density

Porcelain.

29
Genuine porcelain made in some countries of Europe.

30
Excellency of the ancient Japanese porcelain.

Porcelain. density and lustre of this porcelain proceeded only from a fusible and vitreous quality; but as they do not, and as this porcelain is as fixed and as unfusible as the Japanese, its density, so far from being a fault, is a valuable quality: for we must allow, that of porcelains equal in other respects, those are best which are most firm and compact. Hence the interior substance of the Japanese porcelain is esteemed for its greater density, compactness, and lustre, than the vitreous sand or fritt porcelains; because these qualities indicate greater cohesion, and more intimate incorporation of its parts. For the same reason also the superior density of the Saxon porcelain ought to give it the preference to the Japanese. Besides, nothing would be easier than to give the Saxon porcelain the granulous texture of the Japanese, by mixing with the paste a certain quantity of sand. But the persons who perfected that manufacture were certainly sensible that such a conformity to the Japanese porcelain would lessen the merit of theirs: for we know, that in general porcelains are better in proportion as they contain a larger proportion of clay or earth, and less of sand, flints, or other matters of that kind.

What we have said concerning porcelain in general, and the principal kinds of it, seem sufficient to give just notions of it, if not to persons who without considering the subject are determined to prefer the most ancient, to those, at least, who have made experiments on this subject, or who, having a sufficient knowledge of chemistry, are capable of studying and examining it thoroughly. We shall finish this article by giving a short description of the method of manufacturing porcelain as practised in Europe.

31
of making
fusible or
vitreous
porcelains.

The basis of the porcelains which we have called *fusible*, *vitreous*, or *false porcelains*, is called by artists a *fritt*; which is nothing else than a mixture of sand or of powdered flints, with salts capable of disposing them to fusion, and of giving them a great whiteness by means of a sufficient heat. This fritt is to be then mixed with as much, and no more, of a white tenacious earth of an argillaceous or marly nature, than is sufficient to make it capable of being worked upon the wheel. The whole mixture is to be well ground together in a mill, and made into a paste, which is to be formed, either upon the wheel or in moulds, into pieces of such forms as are required.

Each of these pieces, when dry, is to be put into a case made of earthen ware (A); which cases are to be ranged in piles one upon another, in a furnace or kiln, which is to be filled with these to the roof. The furnaces are chambers or cavities of various forms and sizes; and are so disposed, that their fire-place is placed on the outside opposite to one or more openings, which communicate within the furnace. The flame of the fuel is drawn within the furnace, the air of which rarefying, determines a current of air from without inwards, as in all furnaces. At first a very little fire is made, that the furnace may be heated gradually, and is to be increased

more and more till the porcelain is baked, that is, till it has acquired its proper hardness and transparency; which is known by taking out of the furnace from time to time, and examining, small pieces of porcelain, placed for that purpose in cases which have lateral openings. When these pieces show that the porcelain is sufficiently baked, the fire is no longer to be supplied with fuel, the furnace is to be cooled, and the porcelain taken out, which in this state resembles white marble not having a shining surface, which is afterwards to be given by covering them with a vitreous composition called the *glazing*.

The porcelain when baked and not glazed is called *biscuit*, which is more or less beautiful according to the nature of the porcelain. The manufacture of Sévres excels all others in this respect, and it is therefore the only one which can produce very fine pieces of sculpture; that is, in which all the fineness of the workmanship is preserved, and which are preferable in smoothness and whiteness to the finest marble in Italy.

As no piece of sculpture of this kind can preserve all the delicacy of its workmanship when covered with a glazing, and as sculptors avoid polishing their marble figures, because the lustre of the polish is disadvantageous; therefore, in the manufactures of Sévres, all figures or little statues, and even some ornamental vases, are left in the state of biscuit. The other pieces of porcelain are to be glazed in the following manner.

A glass is first to be composed suited to the nature of the porcelain to which it is to be applied; for every glass is not fit for this purpose. We frequently find that a glass which makes a fine glazing for one porcelain shall make a very bad glazing for another porcelain; shall crack in many places, shall have no lustre, or shall contain bubbles. The glazing, then, must be appropriated to each porcelain, that is, to the hardness and density of the ware, and to the ingredients of its composition, &c.

These glazings are prepared by previously fusing together all the substances of which they consist, so as to form vitreous masses. These masses are to be ground very finely in a mill. This vitreous powder is to be mixed with a sufficient quantity of water, or other proper liquor, so that the mixture shall have the consistence of cream of milk. The pieces of porcelain are to be covered with a thin stratum of this matter; and when very dry, they are to be again put into the furnace in the same manner as before for the forming of the biscuit, and to be continued there till the glazing be well fused. The necessary degree of fire for fusing the glazing is much less than that for baking the paste.

The pieces of porcelain which are intended to remain white are now finished; but those which are to be painted and gilded must undergo further operations. The colours to be applied are the same as those used for enamel painting. They all consist of metallic calces bruised and incorporated with a very fusible glass.

Cro-
cus

(A) The cases are called by English potters *feggars*. They are generally formed of coarser clays, but which must be also capable of sustaining the heat required without fusion. By means of these cases the contained porcelain is preserved from the smoke of the burning fuel. The whiteness of the porcelain depends much on their compactness of texture, by which the smoke is excluded, and on the purity of the clay of which they are made.

tion of un-
fusable por-
celain.

cus of iron furnishes a red colour; gold * precipitated by tin makes the purple and violet; copper calcined by acids and precipitated by an alkali gives a fine green; zaffre makes the blue; earths slightly ferruginous produce a yellow; and, lastly, brown and black colours are produced by calcined iron, together with a deep blue of zaffre. These colours being ground with gum-water, or with oil of spike, are to be employed for the painting of the porcelain with designs of flowers and other figures. For gilding, a powder or calx of gold is to be applied in the same manner as the coloured enamels. The painted and gilded porcelains are to be then exposed to a fire capable of fusing the glass, with which the metallic colours are mixed. Thus the colours are made to adhere, and at the same time acquire a gloss equal to that of the glazing. The gold alone has not then a shining appearance, which must be afterwards given to it by burnishing with a blood-stone.

The operations for the unfusable porcelains, and also for such as are of the nature of stone-ware, are somewhat more simple. The sands and stones which enter into their composition are to be ground in a mill: the earths or clays are to be washed: the materials are to be well mixed, and formed into a paste: the pieces are first rudely formed upon a potter's wheel; and when dry, or half dry, they are turned again upon the wheel, and their form is made more perfect: they are then placed in the furnace; not to bake them, but only to apply a sufficient heat to give them such a solidity that they may be handled without breaking, and may receive the glazing. As the pieces of porcelain after this slight heat are very dry, they imbibe water readily. This disposition assists the application of the glazing. The vitrifiable or vitrified matter of this glazing, which has been previously ground in a mill, is to be mixed with such a quantity of water, that the liquor shall have the consistence of milk. The pieces of porcelain are hastily dipt in this liquor, the water of which they imbibe, and thus on their surface is left an uniform covering of the glazing materials. This covering, which ought to be very thin, will soon become so dry, that it cannot stick to the fingers when the pieces are handled.

The pieces of this porcelain are then put into the furnace to be perfectly baked. The heat is to be raised to such a height, that all within the furnace shall be white, and the cases shall be undistinguishable from the flame. When, by taking out small pieces, the porcelain is known to be sufficiently baked, the fire is discontinued, and the furnace cooled. If the baking has been well performed, the pieces of porcelain will be found by this single operation to be rendered compact, sonorous, close-grained, moderately glossy, and covered externally with a fine glazing. The painting and gilding of this porcelain are to be executed in a manner similar to that already described.

PORCELAIN-Shell, a species of *CYPRÆA*.

PORCH, in architecture, a kind of vestibule supported by columns; much used at the entrance of the ancient temples, halls, churches, &c.

A porch, in the ancient architecture, was a vestibule, or a disposition of insulated columns usually crowned with a pediment, forming a covert place before the principal door of a temple or court of justice. Such is that before the door of St Paul's, Covent-Garden, the work of Inigo Jones. When a porch had four columns

in front, it was called a *tetraftyle*; when six, *hexastyle*; when eight, *octostyle*, &c.

PORCH, in Greek *στοα*, a public portico in Athens adorned with the pictures of Polygnotus and other eminent painters. It was in this portico that Zeno the philosopher taught; and hence his followers were called *Stoics*. See *STOICS* and *ZENO*.

PORCUPINE, in zoology. See *HYSTRIX*.

PORCUPINE-Man, the name by which one Edward Lambert, who had a distempered skin, went in London. We have the following account of him in the *Philosophical Transactions* for 1755, by Mr Henry Baker, F. R. S. "He is now (says he) 40 years of age, and it is 24 years since he was first shown to the society. The skin of this man, except on his head and face, the palms of his hands, and the soles of his feet, is covered with excrescences that resemble an innumerable company of warts, of a brown colour and cylindrical figure; all rising to an equal height, which is about an inch, and growing as close as possible to each other at their basis; but so stiff and elastic as to make a rustling noise when the hand is drawn over them. These excrescences are annually shed, and renewed in some of the autumn or winter months. The new ones, which are of a paler colour, gradually rise up from beneath as the old ones fall off; and at this time it has been found necessary for him to lose a little blood, to prevent a slight sickness which he had been used to suffer before this precaution was taken. He has had the smallpox, and he has been twice salivated, in hopes to get rid of this disagreeable covering; but though just when the pustules of the smallpox had scaled off, and immediately after his salivations, his skin appeared white and smooth, yet the excrescences soon returned by a gradual increase, and his skin became as it was before. His health, during his whole life, has been remarkably good: but there is one particular of this case more extraordinary than all the rest; this man has had six children, and all of them had the same rugged covering as himself, which came on like his own about nine weeks after the birth. Of these children only one is now living, a pretty boy, who was shewn with his father. It appears, therefore, as Mr Baker remarks, that a race of people might be propagated by this man, as different from other men as an African is from an Englishman; and that if this should have happened in any former age, and the accidental original have been forgotten, there would be the same objections against their being derived from the same common stock with others: it must therefore be admitted possible, that the differences now subsisting between one part of mankind and another may have been produced by some such accidental cause, long after the earth has been peopled by one common progenitor."

PORE, in anatomy, a little interstice or space between the parts of the skin, serving for perspiration.

PORELLA, in botany; a genus of the natural order of musci, belonging to the cryptogamia class of plants. The antheræ are multilocular, full of natural pores, with an operculum; there is no calyptra, nor pedicle; the capsules contain a powder like those of the other mosses; and their manner of shedding this powder is not by separating into two parts, like those of the felago and lycopodium, but by opening into several holes on all sides.

Porella.

Porentru.
Porism.

PORENTRU, is a town of Switzerland, in Elsgaw, and capital of the territory of the bishop of Basle. It has a good castle, where he resides. It has in it, however, nothing else worth taking notice of, except the cathedral. The bishop is a prince of the empire. It is seated on the river Halle, near mount Jura, 22 miles south of Basle. E. Long. 7. 2. N. Lat. 47. 34.

PORISM, in geometry, is a name given by the ancient geometers to two classes of mathematical propositions. Euclid gives this name to propositions which are involved in others which he is professedly investigating, and which, although not his principal object, are yet obtained along with it, as is expressed by their name *porismata*, "acquisitions." Such propositions are now called *corollaries*. But he gives the same name, by way of eminence, to a particular class of propositions which he collected in the course of his researches, and selected from among many others on account of their great subserviency to the business of geometrical investigation in general. These propositions were so named by him, either from the way in which he discovered them, while he was investigating something else, by which means they might be considered as gains or acquisitions, or from their utility in acquiring farther knowledge as steps in the investigation. In this sense they are *porismata*; for *πορισμα* signifies both to investigate and to acquire by investigation. These propositions formed a collection, which was familiarly known to the ancient geometers by the name of Euclid's *porisms*; and Pappus of Alexandria says, that it was a most ingenious collection of many things conducive to the analysis or solution of the most difficult problems, and which afforded great delight to those who were able to understand and to investigate them.

Unfortunately for mathematical science, however, this valuable collection is now lost, and it still remains a doubtful question in what manner the ancients conducted their researches upon this curious subject. We have, however, reason to believe that their method was excellent both in principle and extent, for their analysis led them to many profound discoveries, and was restricted by the severest logic. The only account we have of this class of geometrical propositions, is in a fragment of Pappus, in which he attempts a general definition of them as a set of mathematical propositions distinguishable in kind from all others; but of this distinction nothing remains, except a criticism on a definition of them given by some geometers, and with which he finds fault, as defining them only by an accidental circumstance, "*Porisma est quod deficit hypothese a theoremate locali.*"

Pappus then proceeds to give an account of Euclid's porisms; but the enunciations are so extremely defective, at the same time that they refer to a figure now lost, that Dr Halley confesses the fragment in question to be beyond his comprehension.

The high encomiums given by Pappus to these propositions have excited the curiosity of the greatest geometers of modern times, who have attempted to discover their nature and manner of investigation. M. Fermat, a French mathematician of the last century, attaching himself to the definition which Pappus criticises, published an introduction (for this is its modest title) to this subject, which many others tried to elucidate in vain. At length Dr Simson of Glasgow, by patient inquiry and some lucky thoughts, obtained a

restoration of the porisms of Euclid, which has all the appearance of being just. It precisely corresponds to Pappus's description of them. All the lemmas which Pappus has given for the better understanding of Euclid's propositions are equally applicable to those of Dr Simson, which are found to differ from local theorems precisely as Pappus affirms those of Euclid to have done. They require a particular mode of analysis, and are of immense service in geometrical investigation; on which account they may justly claim our attention.

While Dr Simson was employed in this inquiry, he carried on a correspondence upon the subject with the late Dr M. Stewart, professor of mathematics in the university of Edinburgh; who, besides entering into Dr Simson's views, and communicating to him many curious porisms, pursued the same subject in a new and very different direction. He published the result of his inquiries in 1746, under the title of *General Theorems*, not caring to give them any other name, lest he might appear to anticipate the labours of his friend and former preceptor. The greater part of the propositions contained in that work are porisms, but without demonstrations; therefore, whoever wishes to investigate one of the most curious subjects in geometry, will there find abundance of materials, and an ample field for discussion.

Dr Simson defines a porism to be "a proposition, in which it is proposed to demonstrate, that one or more things are given, between which, and every one of innumerable other things not given, but assumed according to a given law, a certain relation described in the proposition is shown to take place."

This definition is not a little obscure, but will be plainer if expressed thus: "A porism is a proposition affirming the possibility of finding such conditions as will render a certain problem indeterminate, or capable of innumerable solutions." This definition agrees with Pappus's idea of these propositions, so far at least as they can be understood from the fragment already mentioned; for the propositions here defined, like those which he describes, are, strictly speaking, neither theorems nor problems, but of an intermediate nature between both; for they neither simply enunciate a truth to be demonstrated, nor propose a question to be resolved, but are affirmations of a truth in which the determination of an unknown quantity is involved. In as far, therefore, as they assert that a certain problem may become indeterminate, they are of the nature of theorems; and, in as far as they seek to discover the conditions by which that is brought about, they are of the nature of problems.

We shall endeavour to make our readers understand this subject, distinctly, by considering them in the way in which it is probable they occurred to the ancient geometers in the course of their researches: this will at the same time show the nature of the analysis peculiar to them, and their great use in the solution of problems.

It appears to be certain, that it has been the solution of problems which, in all states of the mathematical sciences, has led to the discovery of geometrical truths: the first mathematical inquiries, in particular, must have occurred in the form of questions, where something was given, and something required to be done; and by the reasoning

Porism.

Porism. reasoning necessary to answer these questions, or to discover the relation between the things given and those to be found, many truths were suggested, which came afterwards to be the subject of separate demonstrations.

The number of these was the greater, because the ancient geometers always undertook the solution of problems, with a scrupulous and minute attention, inasmuch that they would scarcely suffer any of the collateral truths to escape their observation.

Now, as this cautious manner of proceeding gave an opportunity of laying hold of every collateral truth connected with the main object of inquiry, these geometers soon perceived, that there were many problems which in certain cases would admit of no solution whatever, in consequence of a particular relation taking place among the quantities which were given. Such problems were said to become impossible: and it was soon perceived, that this always happened when one of the conditions of the problem was inconsistent with the rest. Thus, when it was required to divide a line, so that the rectangle contained by its segments might be equal to a given space, it is evident that this was possible only when the given space was less than the square of half the line; for when it was otherwise, the two conditions defining, the one the magnitude of the line, and the other the rectangle of its segments, were inconsistent with each other. Such cases would occur in the solution of the most simple problems; but if they were more complicated, it must have been remarked, that the constructions would sometimes fail, for a reason directly contrary to that just now assigned. Cases would occur, where the lines, which by their intersection were to determine the thing sought, instead of intersecting each other as they did commonly, or of not meeting at all as in the abovementioned case of impossibility, would coincide with one another entirely, and of course leave the problem unresolved. It would appear to geometers upon a little reflection, that since, in the case of determinate problems, the thing required was determined by the intersection of the two lines already mentioned, that is, by the points common to both; so in the case of their coincidence, as all their parts were in common, every one of these points must give a solution, or, in other words, the solutions must be indefinite in number.

Upon inquiry, it would be found that this proceeded from some condition of the problem having been involved in another, so that, in fact, there was but one, which did not leave a sufficient number of independent conditions to limit the problem to a single or any determinate number of solutions. It would soon be perceived, that these cases formed very curious propositions of an intermediate nature between problems and theorems; and that they admitted of being enunciated in a manner peculiarly elegant and concise. It was to such propositions that the ancients gave the name of *porisms*. This deduction requires to be illustrated by an example: suppose, therefore, that it were required to resolve the following problem.

Plate
CCCCXIII.

A circle ABC (fig. 1.), a straight line DE, and a point F, being given in position, to find a point G in the straight line DE such, that GF, the line drawn from it to the given point, shall be equal to GB, the line drawn from it touching the given circle.

Suppose G to be found, and GB to be drawn touch-

ing the given circle ABC in B, let H be its centre, join HB, and let HD be perpendicular to DE. From D draw DL, touching the circle ABC in L, and join HL; also from the centre G, with the distance GB or GF, describe the circle BKF, meeting HD in the points K and K'. Then HD and DL are given in position and magnitude; and because GB touches the circle ABC, HBG is a right angle; and since G is the centre of the circle BKF, therefore HB touches the circle BKF, and $HB^2 = \text{the rectangle } K'HK$; which rectangle $+ DK^2 = HD^2$, because K'K is bisected in D, therefore $HL^2 + KD^2 = DH^2 = HL^2$ and $= LD^2$; therefore $DK^2 = DL^2$, and $DK = DL$; and since DL is given in magnitude, DK is also given, and K is a given point: for the same reason K' is a given point, and the point F being given by hypothesis, the circle BKF is given by position. The point G, the centre of the circle, is therefore given, which was to be found. Hence the construction:

Having drawn HD perpendicular to DE, and DL touching the circle ABC, make DK and DK' each equal to DL, and find G the centre of the circle described through the points K'FK; that is, let FK' be joined and bisected at right angles by MN, which meets DE in G, G will be the point required; that is, if GB be drawn touching the circle ABC, and GF to the given point, GB is equal to GF.

The synthetical demonstration is easily derived from the preceding analysis; but it must be remarked, that in some cases this construction fails. For, first, if F fall anywhere in DH, as at F' the line MN becomes parallel to DE, and the point G is nowhere to be found; or, in other words, it is at an infinite distance from D.—This is true in general; but if the given point F coincides with K, then MN evidently coincides with DE; so that, agreeable to a remark already made, every point of the line DE may be taken for G, and will satisfy the conditions of the problem; that is to say, GB will be equal to GK, wherever the point G be taken in the line DE, the same is true if F coincide with K. Thus we have an instance of a problem, and that too a very simple one, which in general, admits of but one solution; but which, in one particular case, when a certain relation takes place among the things given, becomes indefinite, and admits of innumerable solutions. The proposition which results from this case of the problem is a *porism*, and may be thus enunciated:

“A circle ABC being given by position, and also a straight line DE, which does not cut the circle, a point K may be found, such, that if G be any point whatever in DE, the straight line drawn from G to the point K shall be equal to the straight line drawn from G touching the given circle ABC.”

The problem which follows appears to have led to the discovery of many *porisms*.

A circle ABC (fig. 2.) and two points D, E, in a diameter of it being given, to find a point F in the circumference of the given circle; from which, if straight lines be drawn to the given points E, D, these straight lines shall have to one another the given ratio of α to β , which is supposed to be that of a greater to a less.—Suppose the problem resolved, and that F is found, so that FE has to FD the given ratio of α to β , produce EF towards B, bisect the angle EFD by FL, and DFB by FM: therefore $EL : LD :: EF : FD$, that is in a given ratio, and since ED is given, each of the seg-

Porism.

ments EL , LD , is given, and the point L is also given; because DFB is bisected by FM , $EM : MD :: EF : FD$, that is, in a given ratio, and therefore M is given. Since DFL is half of DFE , and DFM half of DFB , therefore LFM is half of $(DFE + DFB)$, therefore LFM is a right angle; and since the points L , M , are given, the point F is in the circumference of a circle described upon LM as a diameter, and therefore given in position. Now the point F is also in the circumference of the given circle ABC , therefore it is in the intersection of the two given circumferences, and therefore is found. Hence this construction: Divide ED in L , so that EL may be to LD in the given ratio of α to β , and produce ED also to M , so that EM may be to MD in the same given ratio of α to β ; bisect LM in N , and from the centre N , with the distance NL , describe the semicircle LFM ; and the point F , in which it intersects the circle ABC , is the point required.

The synthetical demonstration is easily derived from the preceding analysis. It must, however, be remarked, that the construction fails when the circle LFM falls either wholly within or wholly without the circle ABC , so that the circumferences do not intersect; and in these cases the problem cannot be solved. It is also obvious that the construction will fail in another case, viz. when the two circumferences LFM , ABC , entirely coincide. In this case, it is farther evident, that every point in the circumference ABC will answer the conditions of the problem, which is therefore capable of numberless solutions, and may, as in the former instances, be converted into a porism. We now inquire, therefore, in what circumstances the point L will coincide with A , and also the point M with C , and of consequence the circumference LFM with ABC . If we suppose that they coincide $EA : AD :: \alpha : \beta :: EC : CD$, and $EA : EC :: AD : CD$, or by conversion $EA : AC :: AD : CD$ — $AD :: AD : 2DO$, O being the centre of the circle ABC ; therefore, also, $EA : AO :: AD : DO$, and by composition $EO : AO :: AO : DO$, therefore $EO \times OD = AO^2$. Hence, if the given points E and D (fig. 3.) be so situated, that $EO \times OD = AO^2$, and at the same time $\alpha : \beta :: EA : AD :: EC : CD$, the problem admits of numberless solutions; and if either of the points D or E be given, the other point, and also the ratio which will render the problem indeterminate, may be found. Hence we have this porism:

“A circle ABC , and also a point D being given, another point E may be found, such that the two lines inflected from these points to any point in the circumference ABC , shall have to each other a given ratio, which ratio is also to be found.” Hence also we have an example of the derivation of porisms from one another, for the circle ABC , and the points D and E remaining as before (fig. 3.), if, through D , we draw any line whatever HDB , meeting the circle in B and H ; and if the lines EB , EH , be also drawn, these lines will cut off equal circumferences BF , HG . Let FC be drawn, and it is plain from the foregoing analysis, that the angles DFC , CFB , are equal; therefore if OG , OB , be drawn, the angles BOC , COG , are also equal; and consequently the angles DOB , DOG . In the same manner, by joining AB , the angle DBE being bisected by BA , it is evident that the angle AOE

is equal to AOH , and therefore the angle FOB to HOG , that is, the arch FB to the arch HG . This proposition appears to have been the last but one in the third book of Euclid's Porisms, and the manner of its enunciation in the porismatic form is obvious.

The preceding proposition also affords an illustration of the remark, that the conditions of a problem are involved in one another in the porismatic or indefinite case; for here several independent conditions are laid down, by the help of which the problem is to be resolved. Two points D and E are given, from which two lines are to be inflected, and a circumference ABC , in which these lines are to meet, as also a ratio which these lines are to have to each other. Now these conditions are all independent on one another, so that any one may be changed without any change whatever in the rest. This is true in general; but yet in one case, viz. when the points are so related to one another that their rectangle under their distances from the centre is equal to the square of the radius of the circle; it follows from the preceding analysis, that the ratio of the inflected lines is no longer a matter of choice, but a necessary consequence of this disposition of the points.

From what has been already said, we may trace the imperfect definition of a porism which Pappus ascribes to the later geometers, viz. that it differs from a local theorem, by wanting the hypothesis assumed in that theorem.—Now, to understand this, it must be observed, that if we take one of the propositions called *loci*, and make the construction of the figure a part of the hypothesis, we get what was called by the ancient geometers a *local theorem*. If, again, in the enunciation of the theorem, that part of the hypothesis which contains the construction be suppressed, the proposition thence arising will be a porism, for it will enunciate a truth, and will require to the full understanding and investigation of that truth, that something should be found, viz. the circumstances in the construction supposed to be omitted.

Thus, when we say, if from two given points E , D , (fig. 3.) two straight lines EF , FD , are inflected to a third point F , so as to be to one another in a given ratio, the point F is in the circumference of a given circle, we have a locus. But when conversely it is said, if a circle ABC , of which the centre is O , be given by position, as also a point E ; and if D be taken in the line EO , so that $EO \times OD = AO^2$; and if from E and D the lines EF , DF be inflected to any point of the circumference ABC , the ratio of EF to DF will be given, viz. the same with that of EA to AD , we have a local theorem.

Lastly, when it is said, if a circle ABC be given by position, and also a point E , a point D may be found, such that if EF , FD be inflected from E and D to any point F in the circumference ABC , these lines shall have a given ratio to one another, the proposition becomes a porism, and is the same that has just now been investigated.

Hence it is evident, that the local theorem is changed into a porism, by leaving out what relates to the determination of D , and of the given ratio. But though all propositions formed in this way from the conversion of loci, are porisms, yet all porisms are not formed from the conversion of loci; the first, for instance, of the preceding cannot by conversion be changed into a locus; therefore:

Porism.

Porism. therefore Fermat's idea of porisms, founded upon this circumstance, could not fail to be imperfect.

To confirm the truth of the preceding theory, it may be added, that professor Dr Stewart, in a paper read a considerable time ago before the Philosophical Society of Edinburgh, defines a porism to be "A proposition affirming the possibility of finding one or more conditions of an indeterminate theorem;" where, by an indeterminate theorem, he meant one which expresses a relation between certain quantities that are determinate and certain others that are indeterminate; a definition which evidently agrees with the explanations which have been here given.

If the idea which we have given of these propositions be just, it follows, that they are to be discovered by considering those cases in which the construction of a problem fails, in consequence of the lines which by their intersection, or the points which by their position, were to determine the problem required, happening to coincide with one another. A porism may therefore be deduced from the problem to which it belongs, just as propositions concerning the *maxima* and *minima* of quantities are deduced from the problems of which they form limitations; and such is the most natural and obvious analysis of which this class of propositions admits.

The following porism is the first of Euclid's, and the first also which was restored. It is given here to exemplify the advantage which, in investigations of this kind, may be derived from employing the *law of continuity* in its utmost extent, and pursuing porisms to those extreme cases where the indeterminate magnitudes increase *ad infinitum*.

This porism may be considered as having occurred in the solution of the following problem: Two points A, B, (fig. 4.) and also three straight lines DE, FK, KL, being given in position, together with two points H and M in two of these lines, to intersect from A and B to a point in the third, two lines that shall cut off from KF and KL two segments, adjacent to the given points H and M, having to one another the given ratio of α to β . Now, to find whether a porism be connected with this problem, suppose that there is, and that the following proposition is true. Two points A and B, and two straight lines DE, FK, being given in position, and also a point H in one of them, a line LK may be found, and also a point in it M, both given in position, such that AE and BE intersected from the points A and B to any point whatever of the line DE, shall cut off from the other lines FK and LK segments HG and MN adjacent to the given points H and M, having to one another the given ratio of α to β .

First, let AE', BE', be intersected to the point E', so that AE' may be parallel to FK, then shall E'B be parallel to KL, the line to be found; for if it be not parallel to KL, the point of their intersection must be at a finite distance from the point M, and therefore making as β to α ; so this distance to a fourth proportional, the distance from H at which AE' intersects FK, will be equal to that fourth proportional. But AE' does not intersect FK, for they are parallel by construction; therefore BE' cannot intersect KL, which is therefore parallel to BE', a line given in position. Again, let AE', BE'', be intersected to E'', so that AE' may pass through the given point H: then it is plain that BE''

must pass through the point to be found M; for if not, it may be demonstrated just as above, that AE'' does not pass through H, contrary to the supposition. The point to be found is therefore in the line E'B, which is given in position. Now if from E there be drawn EP parallel to AE', and ES parallel to BE', BS : SE :: BL : LN = $\frac{SE \times BL}{BS}$, and AP : PE :: AF : FG = $\frac{PE \times AF}{AP}$,

therefore FG : LN :: $\frac{PE \times AF}{AP}$: $\frac{SE \times BL}{BS}$:: PE \times AF

\times BS : SE \times BL \times AP; wherefore the ratio of FG to LN is compounded of the ratios of AF to BL, PE to ES, and BS to AP; but PE : SE :: AE' : BE', and BS : AP :: DB : DA for DB : BS :: DE' : E'E :: DA : AP; therefore the ratio of FG to LN is compounded of the ratios of AF to BL, AE' to BE', and DB to DA. In like manner, because E'' is a point in the line DE and AE'', BE'' are intersected to it, the ratio of FH to LM is compounded of the same ratios of AF to BL, AE' to BE', and DB to DA; therefore FH : LM :: FG : NL (and consequently) :: HG : MN; but the ratio of HG to MN is given, being the same as that of α to β ; the ratio of FH to LM is therefore also given, and FH being given, LM is given in magnitude. Now LM is parallel to BE', a line given in position; therefore M is in a line QM, parallel to AB, and given in position; therefore the point M, and also the line KLM, drawn through it parallel to BE', are given in position, which were to be found. Hence this construction: From A draw AE' parallel to FK, so as to meet DE in E'; join BE', and take in it BQ, so that $\alpha : \beta :: HF : BQ$, and through Q draw QM parallel to AB. Let HA be drawn, and produced till it meet DE in E'', and draw BE'', meeting QM in M; through M draw KML parallel to BE', then is KML the line and M the point which were to be found. There are two lines which will answer the conditions of this porism; for if in QB, produced on the other side of B, there be taken Bq = BQ, and if qm be drawn parallel to AB, cutting MB in m; and if mn be drawn parallel to BQ, the part mn, cut off by EB produced, will be equal to MN, and have to HG the ratio required. It is plain, that whatever be the ratio of α to β , and whatever be the magnitude of FH, if the other things given remain the same, the lines found will be all parallel to BE'. But if the ratio of α to β remain the same likewise, and if only the point H vary, the position of KL will remain the same, and the point M will vary.

Another general remark which may be made on the analysis of porisms is, that it often happens, as in the last example, that the magnitude required may all, or a part of them, be found by considering the extreme cases; but for the discovery of the relation between them, and the indefinite magnitudes, we must have recourse to the hypothesis of the porism in its most general or indefinite form; and must endeavour so to conduct the reasoning, that the indefinite magnitudes may at length totally disappear, and leave a proposition asserting the relation between determinate magnitudes only.

For this purpose Dr Simson frequently employs two statements of the general hypothesis, which he compares together. As for instance, in his analysis of the last po-

porism,

Porism. rism, he assumes not only E, any point in the line DE, but also another point O, any where in the same line, to both of which he supposes lines to be inflected from the points A, B. This double statement, however, cannot be made without rendering the investigation long and complicated; nor is it even necessary, for it may be avoided by having recourse to simpler *porisms*, or to *loci*, or to propositions of the *data*. The following porism is given as an example where this is done with some difficulty, but with considerable advantage both with regard to the simplicity and shortness of the demonstration. It will be proper to premise the following lemma. Let AB (fig. 7.) be a straight line, and D, L any two points in it, one of which D is between A and B; let CL be any straight line. $\frac{LB}{CL} \cdot AD + \frac{LA}{CL} \cdot BD =$

Plate
CCCXIII.

$$\frac{LB}{CL} \cdot AL + \frac{LA}{CL} \cdot BL + \frac{AB}{CL} \cdot DL^2.$$

Place CL perpendicular to AB, and through the points A, C, B, describe a circle; and let CL meet it again in E, and join AE, BE. Draw DG parallel to CE, meeting AE and BE in H and G. Draw EK parallel to AB.

$$CL : LB :: (LA : LE ::) LA^2 : LA \times LE = \frac{LB}{CL} \cdot LA^2$$

$$CL : LA :: (LB : LE ::) LB^2 : LB \times LE = \frac{LA}{CL} \cdot LB^2$$

Now $CL : LB :: LA : LE :: (EK) LD : KH$, and $CL : LA :: LB : LE :: (EK) LD : KG$; therefore, (V. 24.) $CL : AB :: (LD : GH ::) LD^2 : EK \times GH = \frac{AB}{CL} \cdot LD^2$; therefore $\frac{LB}{CL} \cdot LA^2 + \frac{LA}{CL} \cdot LB^2 + \frac{AB}{CL} \cdot LD^2 =$

$$AB \times LE + EK \times GH. \text{ Again, } CL : LA :: (LB : LE ::) DB : DG :: DB^2 : DB \times DG = \frac{LA}{CL} \cdot DB^2$$

$$\text{and } CL : LB :: (LA : LE ::) DA : DH :: DA^2 : DA \times DH = \frac{LB}{CL} \cdot DA^2; \text{ therefore } \frac{LB}{CL} \cdot DA^2 + \frac{LA}{CL} \cdot DB^2 =$$

$$AD \times DH + DB \times DG = AB \times LE + EK \times GH;$$

$$\text{wherefore } \frac{LB}{CL} \cdot DA^2 + \frac{LA}{CL} \cdot DB^2 = \frac{LB}{CL} \cdot LA^2 + \frac{LA}{CL} \cdot LB^2 + \frac{AB}{CL} \cdot LD^2. \text{ Q. E. D.}$$

Let there be three straight lines AB, AC, CB given in position (fig. 5.); and from any point whatever in one of them, as D, let perpendiculars be drawn to the other two, as DF, DE, a point G may be found, such, that if GD be drawn from it to the point D, the square of that line shall have a given ratio to the sum of the squares of the perpendiculars DF and DE, which ratio is to be found.

Draw AH, BK perpendicular to BC and AC; and in AB take L, so that $AL : LB :: AH^2 : BK^2 :: AC^2 : CB^2$. The point L is therefore given; and if N be taken, so as to have to AL the same ratio that AB has to AH, N will be given in magnitude. Also, since $AH^2 : BK^2 :: AL : LB$, and $AH^2 : AB^2 :: AL : N$, *ex equo* $BK^2 : AB^2 :: LB : N$. Draw LO, LM perpendicular to AC, CB; LO, LM are therefore given in magnitude. Now, because $AB^2 : BK^2 :: AD^2 : DF^2$, $N : LB :: AD^2 : DF^2$, and $DF^2 = \frac{LB}{N}$

Porism. $\cdot AD^2$; and for the same reason $DE^2 = \frac{AL}{N} \cdot BD^2$; but,

$$\text{by the preceding lemma, } \frac{LB}{N} \cdot AD^2 + \frac{AL}{N} \cdot BD^2 = \frac{LB}{N}$$

$$\cdot AL^2 + \frac{AL}{N} \cdot BL^2 + \frac{AB}{N} \cdot DL^2; \text{ that is, } DE^2 + DF^2 =$$

$$LO^2 + LM^2 + \frac{AB}{N} \cdot DL^2. \text{ Join LG then by hypothe-}$$

sis $LO^2 + LM^2$, as to LG^2 , the same ratio as $DF^2 + DE^2$ has to DG^2 ; let it be that of R to N, then $LO^2 + LM^2 = \frac{R}{N} \cdot LG^2$; and therefore $DE^2 + DF^2 = \frac{R}{N} \cdot LG^2 +$

$$\frac{AB}{N} \cdot DL^2; \text{ but } DE^2 + DF^2 = \frac{R}{N} \cdot DG^2; \text{ therefore, } \frac{R}{N}$$

$$\cdot LG^2 + \frac{AB}{N} \cdot DL^2 = \frac{R}{N} \cdot DG^2, \text{ and } \frac{AB}{N} \cdot DL^2 = \frac{R}{N} (DG^2 -$$

$LG^2)$; therefore $DG^2 - LG^2$ has to DL a constant ratio, viz. that of AB to R. The angle DLG is therefore a right angle, and the ratio of AB to R that of equality, otherwise LD would be given in magnitude, contrary to the supposition. LG is therefore given in position: and since $R : N :: AB : N :: LO^2 + LM^2 : LG^2$; therefore the square of LG, and consequently LG, is given in magnitude. The point G is therefore given, and also the ratio of $DE^2 + DF^2$ to DG^2 , which is the same with that of AB to N.

The construction easily follows from the analysis, but it may be rendered more simple; for since $AH^2 : AB^2 :: AL : N$, and $BK^2 : AB^2 :: BL : N$; therefore $AH^2 + BK^2 : AB^2 :: AB : N$. Likewise, if AG, BG, be joined, $AB : N :: AH^2 : AG^2$, and $AB : N :: BK^2 : BG^2$; wherefore $AB : N :: AK^2 + BK^2 : AG^2 + BG^2$ and $AG^2 + BG^2 = AB^2$; therefore the angle AGB is a right one, and $AL : LG :: LG : LB$. If therefore AB be divided in L, so that $AL : LB :: AH^2 : BK^2$; and if LG, a mean proportional between AL and LB be placed perpendicular to AB, G will be the point required.

The step in the analysis, by which a second introduction of the general hypothesis is avoided, is that in which the angle GLD is concluded to be a right angle; which follows from $DG^2 - GL^2$, having a given ratio to LD^2 , at the same time that LD is of no determinate magnitude. For, if possible, let GLD be obtuse (fig. 6,) and let the perpendicular from G to AB meet it in V, therefore V is given: and since $GD^2 - LG^2 = LD^2 + 2DL \times LV$; therefore, by the supposition, $LD^2 + 2DL \times LV$ must have a given ratio to LD^2 ; therefore the ratio of LD^2 to $DL \times VL$, that is, of LD to VL, is given, so that VL being given in magnitude, LD is also given. But this is contrary to the supposition; for LD is indefinite by hypothesis, and therefore GLD cannot be obtuse, nor any other than a right angle. The conclusion here drawn immediately from the indetermination of LD would be deduced according to Dr Simson's method, by assuming another point D' and how, and from the supposition that $GD'^2 - GL'^2 : LD'^2 :: GD^2 - GL^2 : LD^2$, it would easily appear that GLD must be a right angle, and the ratio that of equality.

These porisms facilitate the solution of the general problems from which they are derived. For example, let three straight lines AB, AC, BC (fig. 5.), be given in position.

PORISM.

Trenchard sc.

Porism,

position, and also a point R, to find a point D in one of the given lines, so that DE and DF being drawn perpendicular to BC, AC, and DR, joined; $DE^2 + DF^2$ may have to DR^2 a given ratio. It is plain, that having found G, the problem would be nothing more than to find D, such that the ratio of GD^2 to DR^2 , and therefore that of GD to DR, might be given, the point D being in the circumference of a given circle, as is well known to geometers.

The same porism also assists in the solution of another problem. For if it were required to find D such that $DE^2 + DF^2$ might be a given space; having found G, DG^2 would have to $DE^2 + DF^2$ a given ratio, and DG would therefore be given; whence the solution is obvious.

The connection of this porism with the impossible case of the problem is evident; the point L being that from which, if perpendiculars be drawn to AC and CB, the sum of their squares is the least possible. For since $DF^2 + DE^2 : DG^2 :: LO^2 + LM^2 : LG^2 ::$ and since LG is less than DG, $LO^2 + LM^2$ must be less than $DF^2 + DE^2$. It is evident from what has now appeared, that in some instances at least there is a close connection between those propositions and the *maxima* or *minima*, and of consequence the impossible cases of problems. The nature of this connection requires to be farther investigated, and is the more interesting because the transition from the indefinite to the impossible case seems to be made with wonderful rapidity. Thus in the first proposition, though there be not properly speaking an impossible case, but only one where the point to be found goes off *ad infinitum*, it may be remarked, that if the given point F be anywhere out of the line HD (fig. 1), the problem of drawing GB equal to GF is always possible, and admits of just one solution; but if F be in DH, the problem admits of no solution at all, the point being then at an infinite distance, and therefore impossible to be assigned. There is, however, this exception, that if the given point be at K in this same line, DH is determined by making DK equal to DL. Then every point in the line DE gives a solution, and may be taken for the point G. Here therefore the case of numberless solutions, and of no solution at all, are as it were *conterminal*, and so close to one another, that if the given point be at K the problem is indefinite; but if it remove ever so little from K, remaining at the same time in the line DH, the problem cannot be resolved. This affinity might have been determined *à priori*: for it is, as we have seen, a general principle, that a problem is converted into a porism when one or when two of the conditions of it necessarily involve in them some one of the rest. Suppose, then, that two of the conditions are exactly in that state which determines the third; then while they remain fixed or given, should that third one vary or differ ever so little from the state required by the other two, a contradiction will ensue: therefore if, in the hypothesis of a problem, the conditions be so related to one another as to render it indeterminate, a porism is produced; but if, of the conditions thus related to one another, some one be supposed to vary, while the others continue the same, an absurdity follows, and the problem becomes impossible. Wherever, therefore, any problem admits both of an indeterminate and an impossible case, it is certain, that these cases are nearly related to one

another, and that some of the conditions by which they are produced are common to both." It is supposed above, that *two* of the conditions of a problem involve in them a third; and wherever that happens, the conclusion which has been deduced will invariably take place. But a porism may in some cases be so simple as to arise from the mere coincidence of *one* condition with another, though in no case whatever any inconsistency can take place between them. There are, however, comparatively few porisms so simple in their origin, or that arise from problems where the conditions are but little complicated; for it usually happens that a problem which can become indefinite may also become impossible; and if so, the connection already explained never fails to take place.

Another species of impossibility may frequently arise from the porismatic case of a problem which will affect in some measure the application of geometry to astronomy, or any of the sciences depending on experiment or observation. For when a problem is to be resolved by help of data furnished by experiment or observation, the first thing to be considered is, whether the data so obtained be sufficient for determining the thing sought: and in this a very erroneous judgment may be formed, if we rest satisfied with a general view of the subject; for tho' the problem may in general be resolved from the data with which we are provided, yet these data may be so related to one another in the case under consideration, that the problem will become indeterminate, and instead of one solution will admit of an indefinite number. This we have already found to be the case in the foregoing propositions. Such cases may not indeed occur in any of the practical applications of geometry; but there is one of the same kind which has actually occurred in astronomy. Sir Isaac Newton, in his *Principia*, has considered a small part of the orbit of a comet as a straight line described with an uniform motion. From this hypothesis, by means of four observations made at proper intervals of time, the determination of the path of the comet is reduced to this geometrical problem: Four straight lines being given in position, it is required to draw a fifth line across them, so as to be cut by them into three parts, having given ratios to one another. Now this problem had been constructed by Dr Wallis and Sir Christopher Wren, and also in three different ways by Sir Isaac himself in different parts of his works; yet none of these geometers observed that there was a particular situation of the lines in which the problem admitted of innumerable solutions: and this happens to be the very case in which the problem is applicable to the determination of the comet's path, as was first discovered by the Abbé Boscovich, who was led to it by finding, that in this way he could never determine the path of a comet with any degree of certainty.

Besides the geometrical there is also an algebraical analysis belonging to porisms; which, however, does not belong to this place, because we give this account of them merely as an article of ancient geometry; and the ancients never employed algebra in their investigations. Mr Playfair, professor of mathematics in the university of Edinburgh, has written a paper on the origin and geometrical investigation of porisms, which is published in the third volume of the Transactions of the Royal Society of Edinburgh, from which this account of the

Porism.

Plate
CCCCXIII

subject

Pork,
Porlock.

subject is taken. He has there promised a second part to his paper, in which the algebraical investigation of porisms is to be considered. This will no doubt throw considerable light upon the subject, as we may readily judge from that gentleman's known abilities, and from the specimen he has already given us in the first part.

PORK, the flesh of swine killed for the purposes of food. See SUS.

The hog is the only domestic animal that we know of no use to man when alive, and therefore seems properly designed for food. Besides, as loathsome and ugly to every human eye, it is killed without reluctance. The Pythagoreans, whether to preserve health, or on account of compassion, generally forbade the use of animal food; and yet it is alleged that Pythagoras reserved the use of hog's flesh for himself. The Jews, the Egyptians, &c. and other inhabitants of warm countries, and all the Mahometans at present, reject the use of pork. It is difficult to find a satisfactory reason for this, or for the precept given to the Jews respecting it, though unquestionably there was some good one for it. The Greeks gave great commendations to this food; and Galen, though indeed that is expected to be from a particular fondness, is every where full of it. The Romans considered it as one of their delicacies; and if some of the inhabitants of the northern climates have taken an aversion to it, that probably arose from the uncultivated state of their country not being able to rear it. Pork is of a very tender structure; increased perhaps from a peculiarity in its economy, viz. taking on fat more readily than any other animal. Pork is a white meat even in its adult state, and then gives out a jelly in very great quantity. On account of its little perspirability and tenderness it is very nutritious, and was given for that intention to the *athleta*. With regard to its alkalescency, no proper experiments have yet been made; but as it is of a gelatinous and succulent nature, it is probably less so than many others. Upon the whole,

Cullen's
Mat. Med.

it appears to be a very valuable nutriment; and the reason is not very obvious why it was in some countries forbidden. It is said that this animal is apt to be diseased; but why were not inconveniences felt on that account in Greece? Again, it has been alleged, that as Palestine would not rear these animals, and as the Jews had learned the use of them in Egypt, it was necessary they should have a precept to avoid them. But the Egyptians themselves did not use this meat; and this religious precept, indeed, as well as many others, seems to have been borrowed from them. Possibly, as pork is not very perspirable, it might increase the leprosy, which was said to be epidemic in Palestine; though this is far from being certain.

PORLOCK, in the county of Somerset in England, is a small sea-port town six miles west from Minehead. This whole parish, including hamlets, contains about 110 houses, and nearly 600 inhabitants. The situation of the town is very romantic, being nearly surrounded on all sides, except toward the sea, by steep and lofty hills, intersected by deep vales and hollow glens. Some of the hills are beautifully wooded, and contain numbers of wild deer. The valleys are very deep and picturesque; the sides being steep, scarred with wild rocks, and patched with woods and forest shrubs. Some of them are well cultivated and fludded with villages or single farms and cottages, although agriculture here is very imperfectly

understood. Most of the roads and fields are so steep, that no carriages of any kind can be used; all the crops are therefore carried in with crooks on horses, and the manure in wooden pots called *doffels*. Many of the poor are employed in spinning yarn for the Dunster manufactory. W. Long. 3. 32. N. Lat. 51. 14.

PORO. See CALAURIA.

PORPESSE, in ichthyology. See DELPHINUS.

PORPHYRIUS, a famous Platonic philosopher, was born at Tyre in 233, in the reign of Alexander Severus. He was the disciple of Longinus, and became the ornament of his school at Athens; from thence he went to Rome, and attended Plotinus, with whom he lived six years. After Plotinus's death he taught philosophy at Rome with great applause; and became well skilled in polite literature, geography, astronomy, and music. He lived till the end of the third century, and died in the reign of Dioclesian. There are still extant his book on the Categories of Aristotle; a Treatise on Abstinence from Flesh; and several other pieces in Greek. He also composed a large treatise against the Christian religion, which is lost. That work was answered by Methodius bishop of Tyre, and also by Eusebius, Apollinarius, St Augustine, St Jerome, St Cyril, and Theodoret. The emperor Theodosius the Great caused Porphyrius's book to be burned in 338. Those of his works that are still extant were printed at Cambridge in 1655, 8vo, with a Latin version.

"Porphyrius (says Dr Enfield) was, it must be owned, a writer of deep erudition; and had his judgment and integrity been equal to his learning, he would have deserved a distinguished place among the ancients. But neither the splendor of his diction, nor the variety of his reading, can atone for the credulity or the dishonesty which filled the narrative parts of his works with so many extravagant tales, or interest the judicious reader in the abstruse subtleties and mystical flights of his philosophical writings."

PORPHYRY, a genus of stones belonging to the order of faxes. It is found of several different colours, as green, deep-red, purple, black, dark-brown, and grey. Under the name of *porphyry*, Mr Kirwan and M. de Saussure include those stones which contain either felt-spar, schoerl, quartz, or mica, with other species of crystallized stone on a siliceous or calcareous ground. There are a great many different kinds. M. Ferber describes 20 varieties under four species, but in general it is considered with relation to its ground, which is met with of the colours already mentioned. When the ground is of jasper, the porphyry is commonly very hard; the red generally contains felt-spar in small white dots or specks; and frequently, together with these, black spots of schoerl. The green is often magnetic, and is either a jasper or schoerl, with spots of quartz. Sometimes a porphyry of one colour contains a fragment of another of a different colour. Those that have chert for their ground are fusible *per se*. The calcareous porphyry consists of quartz, felt-spar, and mica, in separate grains, united by a calcareous cement; and, lastly, the micaceous porphyry consists of a greenish grey micaceous ground, in which red felt-spar and greenish soap-rock are inserted.

The porphyry of the ancients is a most elegant mass of an extremely firm and compact structure, remarkably heavy, and of a fine strong purple, variegated more or less

Poro
Porphyry.

Porphyry. lefs with pale red and white ; its purple is of all degrees, from the claret-colour to that of the violet ; and its variegations are rarely difpofed in veins, but fpois, fometimes very fmall, and at others running into large blotches. It is lefs fine than many of the ordinary marbles ; but it excels them all in hardnefs, and is capable of a moft elegant polifh. It is ftill found in immense ftrata in Egypt. The hard red-lead coloured porphyry, variegated with black, white, and green, is a moft beautiful and valuable fubftance. It has the hardnefs and all the other characters of the oriental porphyry ; and even greatly excels it in brightnefs, and in the beauty and variegation of its colours. It is found in great plenty in the ifland of Minorca ; and is well worth importing, being greatly fuperior to all the Italian marbles. The hard, pale-red porphyry, variegated with black, white, and green is of a pale flefh-colour ; often approaching to white. It is variegated in blotches from half an inch to an inch broad. It takes a high polifh, and emulates all the qualities of the oriental porphyry. It is found in immense ftrata in Arabia Petræa, and in the Upper Egypt ; and in feparate nodules in Germany, England, and Ireland.

Picoroni takes notice of two exquisitely fine columns of black porphyry in a church at Rome. In Egypt there are three celebrated obelifks or pillars of porphyry, one near Cairo and two at Alexandria. The French call them *aguglias*, and in England they are called *Gleopatras needles*.

The art of cutting porphyry, praftifed by the ancients, appears now to be loft. Indeed it is difficult to conceive what tools they ufed for fashioning thofe huge columns and other porphyry works in fome of the ancient buildings in Rome. One of the moft confiderable of thefe, ftill entire, is a tomb of Conftantia, the emperor Conftantine's daughter. It is in the church of St Agnes, and is commonly called *the tomb of Bacchus*. In the palace of the Thuilleries there is alfo a buft of Apollo and of twelve emperors, all in porphyry. Some ancient pieces feem to have been wrought with the chiffel, others with the faw, others with wheels, and others gradually ground down with emery. Yet modern tools will fcarce touch porphyry. Dr Leifter therefore thinks*, that the ancients had the fecret of tempering fteel better than we ; and not, as fome imagine, that they had the art of foftening the porphyry ; though it is probable that time and air have contributed to increafe its hardnefs. Mr Addifon fays, he faw a workman at Rome cutting porphyry ; but his advances were extremely flow and almoft infenfible. The Italian fculptors work the pieces of old porphyry columns ftill remaining (for the porphyry quarries are long fince loft) with a brafs faw without teeth. With this faw, emery, and water, they rub and wear the ftone with infinite patience. Many perfons have endeavoured to retrieve the ancient art, and particularly Leon Baptifta Alberti ; who, fearching for the neceffary materials for temper, fays, he found goats blood the beft of any : but even this availed not much ; for in working with chiffels tempered with it, farks of fire came much more plentifully than pieces of the ftone. The fculptors were thus, however, able to make a flat or oval form ; but could never attain to any thing like a figure.

In the year 1555, Cofmo de Medicis is faid to have diftilled a water from certain herbs, with which his fculp-

tor Francesco Tadda gave his tools fuch an admirable hardnefs and fo fine a temper, that he performed fome very exquisite works with them ; particularly our Saviour's head in demi-relievo, and Cofmo's head and his duchefs's. The very hair and beard, how difficult foever, are here well conducted ; and there is nothing of the kind fuperior to it in all the works of the ancients ; but the fecret appears to have died with him. The French have difcovered another mode of cutting porphyry, *viz.* with an iron faw without teeth, and *graz*, a kind of free ftone pulverized, and water. The authors of this invention fay, that they could form the whole contour of a column hereby if they had matter to work on. Others have propofed to harden tools fo as to cut porphyry, by fleeping them in the juice of the plant called *bear's beech* or *brankurfine*. See Birch's *Hift.* R. S. vol. i. p. 238. vol. ii. p. 73, &c. Mr Boyle fays, that he caufed porphyry to be cut by means of emery, fteel faws, and water ; and obferves, that in his time the Englifh workmen were ignorant of the manner of working porphyry, and that none of them would undertake to cut or polifh it. See his *Works* abr. vol. i. p. 111.

Da Costa fupposes, and perhaps with reafon, that the method ufed by the ancients in cutting and engraving porphyry was extremely fimple, and that it was performed without the aid of any fcientific means that are now loft. He imagines, that, by unwearied diligence, and with numbers of common tools at great expence, they rudely hewed or broke the ftone into the intended figure, and by continued application reduced them into more regular defigns ; and that they completed the work by polifhing it with great labour, by the aid of particular hard fands found in Egypt. And he thinks, that in the porphyry quarries there were layers of grit or loofe difunited particles, analogous to the porphyry, which they carefully fought for, and ufed for this work. See *Nat. Hift. of Foffils*, p. 285.

PORPHYRY-Shell, a fpecies of MUREX.

PORPITES, the HAIR-BUTTON-STONE, in natural hiftory, a name given by authors to a fmall fpecies of foffil coral ; which is ufually of a rounded figure confiderably flattened, and ftriated from the centre every way to the circumference. Thefe are of different fizes and of different colours, as greyifh, whitifh, brownifh, or bluifh, and are ufually found immerfed in ftone. See Plate CC.

PORRUM, the LEEK ; a fpecies of plants, belonging to the genus of ALLIUM.

PORT, a harbour, river, or haven, formed either by nature or art to receive and felter fhipping from the ftorms and waves of the open fea.

Artificial ports are thofe which are either formed by throwing a ftrong mound or rampire acrofs the harbour's mouth to fome ifland or rock, or erecting two long barriers, which ftretch from the land on each fide like arms or the horns of a crefcent, and nearly inclofe the haven ; the former of thefe are called *mole-heads* and the latter *piers*.

PORT, is alfo a name given on fome occafions to the larboard or left fide of the fhip, as in the following inftances. Thus it is faid, "the fhip heels to port," *i. e.* floops or inclines to the larboard-fide. "Top the yard to port !" the order to make the larboard extremity of a yard higher than the other. "Port the helm !" the

Port.

Port
||
Porter.

order to put the helm over to the larboard-side of the vessel. In all these senses this phrase appears intended to prevent any mistakes happening from the similarity of sounds in the words *starboard* and *larboard*, particularly when they relate to the helm, where a misapprehension might be attended with very dangerous consequences.

PORTS, the embrasures or openings in the side of a ship of war, wherein the artillery is ranged in battery upon the decks above and below.

The ports are formed of a sufficient extent to point and fire the cannon, without injuring the ship's side by the recoil; and as it serves no end to enlarge them beyond what is necessary for that purpose, the shipwrights have established certain dimensions, by which they are cut in proportion to the size of the cannon.

The ports are shut in at sea by a sort of hanging-doors called the *port-lids*; which are fastened by hinges to their upper edges, so as to let down when the cannon are drawn into the ship. By this means the water is prevented from entering the lower decks in a turbulent sea. The lower and upper edges of the ports are always parallel to the deck, so that the guns, when levelled in their carriages, are all equally high above the lower extremity of the ports, which is called the *port-cells*.

PORT, is also a strong wine brought from Port-a-port, and also called *Porto* and *Oporto*.

PORT of the Voice, in music, the faculty or habit of making the shakes, passages, and diminutions, in which the beauty of a song or piece of music consists.

PORT-Crayon, a pencil-case, which is usually four or five inches long, and contrived so as that the pencil may slide up and down. Its inside is round, and its outside is sometimes filed into eight sides or faces, on which are drawn the sector-lines; sometimes it is made round both without-side and within, and has its length divided into inches and parts of inches.

PORT-Fire, a composition for setting fire to powder, &c. Port-fires are frequently used by artillery people in preference to matches; and they are distinguished into wet and dry port-fires. The composition of the former is saltpetre four, sulphur one, and mealed powder four. When these materials are thoroughly mixed and sifted, the whole is to be moistened with a little linseed oil, and rubbed between the hands till all the oil is imbibed by the composition. The preparation for dry port-fires is saltpetre four, sulphur one, mealed powder two, and antimony one. These compositions are driven into small paper cases, to be used whenever necessary.

PORT-aux-Prune, so called by the French, is a country on the coast of Africa, to the north of the island of Madagascar. It is a rich country, and fertile in rice and pastures; it is inhabited only by the negroes, who are an industrious good sort of people, but very superstitious. There are no towns, but several villages, and they have some customs which seem to incline to Judaism.

PORT-Jackson, in New Holland. See *NEW HOLLAND*, n° 7, &c.

PORT-Royal, a sea-port town in the island of Jamaica. It was once a place of the greatest riches and importance in the West Indies: but in 1692 it was destroyed by an earthquake, in 1702 by fire, in 1722 by an inundation

of the sea, and in 1744 it suffered greatly by a hurricane. It is now reduced to three streets, a few lanes, and about 200 houses. It contains the royal navy-yard for heaving down and refitting the king's ships; the navy-hospital, and barracks for a regiment of soldiers. The fortifications, which are very extensive, being in excellent order, and having been lately strengthened with many additional works, it may be said to vie in point of strength with any fortress in the king's dominions. The harbour is one of the best in the world, and 1000 ships may ride therein, secure from every wind that can blow. It is six miles east of Spanish-town, and as much by water south-east of Kingston. W. Long. 76. 40. N. Lat. 18. 0.

PORT-Royal, an island in North America, on the coast of South Carolina, which, with the neighbouring continent, forms one of the most commodious harbours in the United States. It is 15 miles in length; and the town on the north shore is called *Beaufort*. W. Long. 80. 10. N. Lat. 31. 40.

PORT-Royal, the name of two monasteries of Cistercian nuns in the diocese of Paris; the one near Chevreuse, at the distance of five leagues from Paris, called *Port-Royal of the Fields*; and the other in Paris, in the suburbs of St James.

The nuns of the former of these monasteries proving refractory, were dispersed; when many ecclesiastics, and others, who were of the same sentiments as these religious, retired to Port-Royal, took apartments there, and printed many books. Hence the name of *Port-Royalists* was given to all their party, and their books were called *books of Port-Royal*: from hence we say the writers of Port-Royal, Messieurs de Port-Royal, and the translations and grammars of Port-Royal.

PORTA, or *Vena PORTA*, in anatomy, a large vein distributed through the liver in the manner of an artery. See *ANATOMY*, n° 96.

PORTA-Angusta (anc. geog.), mentioned only by Ptolemy; a town of the Vaccæi in the Hither Spain; thought by some to be *Torre Quemada*, in Old Castile; by others *Los Valvases*, a village between Burgos and Torre Quemada.

PORTÆ-ROMANÆ (anc. geog.), according to Pliny, Romulus left but three, or at most four, gates of Rome: afterwards, on enlarging the Pomœria, or compass of the city, they amounted to 37.

PORTAL, in architecture, a little gate where there are two gates of a different bigness; also a little square corner of a room cut off from the rest by the wainscot, and forming a short passage into the room. The same name is also sometimes given to a kind of arch of joiners work before a door.

PORTATE, or a *Cross PORTATE*, in heraldry, a cross which does not stand upright, as crosses generally do; but lies across the escutcheon in bend, as if it were carried on a man's shoulder.

PORTCULLICE, in fortification, is an assemblage of several large pieces of wood, joined across one another like a harrow, and each pointed with iron at the bottom. They are sometimes hung over the gate-way of old fortified towns, ready to let down in case of surprise, when the gates could not be shut.

PORTER, a kind of malt liquor which differs from ale and pale beer, in its being made with high dried malt. See *ALE*, *BEER*, and *BREWING*.

PORT.

Port-
Glasgow,

Portico.

PORT-GLASGOW. See GLASGOW, n° 10.

PORTGREVE, or PORTGRAVE, was anciently the principal magistrate in ports and other maritime towns. The word is formed from the Saxon *port*, "a port or other town;" and *gerefa*, "a governor."—It is sometimes also written *port-reve*.

Camden observes, that the chief magistrate of London was anciently called *port-greve*: instead of whom, Richard I. ordained two bailiffs; and soon afterwards King John granted them a mayor for their yearly magistrature.

PORTICI, a palace of the king of Naples, six miles from that capital. It has a charming situation, on the sea-side, near mount Vesuvius. It is enriched with a vast number of fine statues, and other remains of antiquity, taken out of the ruins of Herculaneum.

The museum consists of 16 rooms, in which the different articles are arranged with very great taste. The floors are paved with Mosaic, taken from the recovered towns, and the walls of the court are lined with inscriptions. Besides busts, statues, medals, intaglios, lamps, and tripods, there is scarcely an article used by the ancients of which a specimen may not be seen in this museum. "But the most valuable room is the library, from the numerous manuscript rolls which it contains. What a field is here for conjecture! what room for hope! Among this inestimable collection, how many great works are there, of which even the names are now unknown! how many unbroken volumes, whose very fragments, preserved in the writings of the ancient scholiasts, convey to us moral improvement, information, and delight! perhaps all the dramatic pieces of Menander and Philemon; perhaps, nay, certainly, the lost Decades of Livy; for it is impossible to suppose, that among so many rolls, the most admired history of the people who possessed them is not to be found: what private library in Britain is without the best histories of England? But how I tremble for their situation, as Portici is built on the lava that overwhelmed Herculaneum! How I tremble too for the indifference of the king of Naples towards this invaluable treasure, in which all the most enlightened people of Europe are deeply interested! When I first saw them, I had no idea of what they were, as they resemble wooden truncheons burnt almost to charcoal. They are so hard and brittle, that the greatest caution must be used in removing them, lest they crumble to dust; nevertheless, an ingenious friar of Genoa, named *Raggio*, undertook to unroll them; and by a most curious, though tedious process, so far succeeded, as to transcribe three Greek Treatises on Philosophy and Music; but finding (as I hear) no other encouragement than his salary, which was but little more than you pay some of your servants, the work was unhappily discontinued. Were these manuscripts in England, they would not long remain a secret to the world."

PORTICO, in architecture, a kind of gallery on the ground; or a piazza encompassed with arches supported by columns, where people walk under covert. The roof is usually vaulted, sometimes flat. The ancients called it *lacunar*. Though the word *portico* be derived from *porta*, "gate, door;" yet it is applied to any disposition of columns which form a gallery, without any immediate relation to doors or gates. The most celebrated porticoes of antiquity were, those of So-

lomon's temple, which formed the atrium or court, and encompassed the sanctuary; that of Athens, built for the people to divert themselves in, and wherein the philosophers held their disputes and conversations, (see *Porch*); and that of Pompey at Rome, raised merely for magnificence, consisting of several rows of columns supporting a platform of vast extent; a draught whereof, Serlio gives us in his antique buildings. Among the modern porticoes, the most celebrated is the piazza of St Peter of the Vatican.—That of Covent-Garden, London, the work of Inigo Jones, is also much admired.

PORTII. See POMPEII.

PORTLAND, a peninsula in Dorsetshire, of great strength both by nature and art, being surrounded with inaccessible rocks, except at the landing-place, where there is a strong castle, called *Portland castle*, built by king Henry VIII. There is but one church in the island: and that stands so near the sea, that it is often in danger from it. It is now chiefly noted for the freestone which is found there, and which is greatly employed in London, and other parts of England, for building the finest structures. St Paul's church, in particular, was built therewith. W. Long. 2. 35. N. Lat. 50. 30.

The following custom at Portland is worthy of notice. "While I was looking over the quarries at Portland (says Mr Smeaton), and attentively considering the operations, observing how soon the quarrymen would cut half a ton of spawls from an unformed block, and what large pieces flew off at every stroke; how speedily their blows followed one another, and how incessantly they pursued this labour with a tool of from 18 to 20 pound weight; I was naturally led to view and consider the figure of the operative agent; and after having observed, that by far the greatest number of the quarrymen were of a very robust hardy form, in whose hands the tool I have mentioned seemed a mere play-thing, I at last broke out with surprise, and inquired of my guide, Mr Roper, where they could possibly pick up such a set of stout fellows to handle the *kevel*, which in their hands seemed nothing? for I observed, that in the space of 15 minutes, they would knock off as much waste matter from a mass of stone, as any of that occupation I had ever seen before would do in an hour. Says Roper, 'we do not go to fetch those men from a distance, they are all born upon the island, and many of them have never been farther upon the main land than to Weymouth.' I told him, I thought the air of that island must be very propitious, to furnish a breed of men so particularly formed for the business they followed. 'The air (he replied), though very sharp from our elevated situation, is certainly very healthy to working men; yet if you knew how these men are produced, you would wonder the less; for all our marriages here are productive of children.' On desiring an explanation how this happened, he proceeded: 'Our people here, as they are bred to hard labour, are very early in a condition to marry and provide for a family; they intermarry with one another, very rarely going to the main-land to seek a wife; and it has been the custom of the island, from time immemorial, that they never marry till the woman is pregnant.' But pray (said I) does not this subject you to a great number of bastards? Have not your Portlanders the same kind of fickleness

Portii.

Watkins's
Travels
through
Switzerland,
Italy,
&c.

Portland.

in their attachments that Englishmen are subject to? and, in consequence, does not this produce many inconveniences? 'None at all (replies Roper), for previous to my arrival here, there was but one child on record of the parish register that had been born a bastard in the compass of 150 years. The mode of courtship here is, that a young woman never admits of the serious addresses of a young man, but on supposition of a thorough probation. When she becomes with child, she tells her mother, the mother tells her father, her father tells his father, and he tells his son, that it is then proper time to be married.' But suppose, Mr Roper, she does not prove to be with child, what happens then? Do they live together without marriage? or, if they separate, is not this such an imputation upon her, as to prevent her getting another suitor? 'The case is thus managed (answered my friend), if the woman does not prove with child after a competent time of courtship, they conclude they are not destined by Providence for each other; they therefore separate; and as it is an established maxim, which the Portland women observe with great strictness, never to admit a plurality of lovers at one time, their honour is no way tarnished: she just as soon (after the affair is declared to be broke off) gets another suitor, as if she had been left a widow, or that nothing had ever happened, but that she had remained an immaculate virgin.' But pray, Sir, did nothing particular happen upon your men coming down from London? 'Yes (says he) our men were much struck, and mightily pleased with the facility of the Portland ladies, and it was not long before several of the women proved with child; but the men being called upon to marry them, this part of the lesson they were uninstructed in; and on their refusal, the Portland women arose to stone them out of the island; inasmuch, that those few who did not choose to take their sweethearts for *better or for worse*, after so fair a trial, were in reality obliged to decamp; and on this occasion some few bastards were born: but since then matters have gone on according to the ancient custom."

PORTLAND VASE, a celebrated funeral vase which was long in possession of the Baberini family; but which was lately purchased for 1000 guineas by the Duke of Portland, from whom it has derived its present name. Its height is about ten inches, and its diameter where broadest six. There are a variety of figures upon it of most exquisite workmanship, in bas relief of white opaque glass, raised on a ground of deep blue glass, which appears black except when held against the light. It appears to have been the work of many years, and there are antiquarians who date its production several centuries before the Christian era; since, as has been said, sculpture was declining in excellence in the time of Alexander the Great.

Respecting the purpose of this vase, and what the figures on it were meant to represent, there have been a variety of conjectures, which it is not our business to enumerate. We think with Dr Darwin* that it was not made for the ashes of any particular person deceased; and therefore that the subject of its embellishments is not a private history, but of a general nature. But we are not sure that he is right in conjecturing it to represent a part of the Eleusinian mysteries; because that conjecture depends on Warburton's explanation of the 6th book of the *Æneid*, which does not now command

* *Leaves of the Plants.*

that respect which it did when it was first proposed. We shall therefore give a short account of the several figures, without noticing any of the theories or conjectures that have been made about them.

In one compartment three exquisite figures are placed on a ruined column, the capital of which is fallen, and lies at their feet among other disjointed stones: they sit under a tree on loose piles of stone. The middle figure is a female in a reclining and dying attitude, with an inverted torch in her left hand, the elbow of which supports her as she sinks, while the right hand is raised and thrown over her drooping head. The figure on her right hand is a man, and that on the left a woman, both supporting themselves on their arms, and apparently thinking intensely. Their backs are to the dying figure, and their faces are turned to her, but without an attempt to assist her. On another compartment of the vase is a figure coming through a portal, and going down with great timidity into a darker region, where he is received by a beautiful female, who stretches forth her hand to help him: between her knees is a large and playful serpent. She sits with her feet towards an aged figure, having one foot sunk into the earth, and the other raised on a column, with his chin resting on his hand. Above the female figure is a Cupid preceding the first figure, and beckoning to him to advance. This first figure holds a cloak or garment, which he seems anxious to bring with him, but which adheres to the side of the portal through which he has passed. In this compartment there are two trees, one of which bends over the female figure and the other over the aged one. On the bottom of the vase there is another figure on a larger scale than the one we have already mentioned, but not so well finished nor so elevated. This figure points with its finger to its mouth. The dress appears to be curious and cumbersome, and above there is the foliage of a tree. On the head of the figure there is a Phrygian cap: it is not easy to say whether this figure be male or female. On the handles of the vase are represented two aged heads with the ears of a quadruped, and from the middle of the forehead rises a kind of tree without leaves: these figures are in all probability mere ornaments, and have no connection with the rest of the figures, or the story represented on the vase.

PORTLANDIA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking with those of which the order is doubtful. The corolla is elevated and funnel-shaped; the antheræ are longitudinal; the capsule pentagonal, and retuse at top; bilocular, and crowned with a pentaphyllous calyx.

There are two species, viz. the *grandiflora* and *hexandra*; the former of which has been particularly described by Dr Browne, who has also given a good figure of it. It has frequently flowered in the royal garden at Kew, and in Dr Pitcairn's at Ilington.

The external bark is remarkably rough, furrowed, and thick; it has no taste. The inner bark is very thin, and of a dark brown colour. Its taste is bitter and astringent, and its virtues are the same as those of the Jesuit's bark. Infused in spirits or wine with a little orange-peel, it makes an excellent stomachic tincture.

PORT-LOUIS, is a strong town of France, in Bretagne,

Portland
||
Port-Louis

Port,
Porto.

tagne, in the diocese of Vannes, with a citadel and a good harbour. It was fortified by Louis XIII. from whom it derived its name. It was a station for part of the royal navy and the East India ships belonging to France. It is seated at the mouth of the river Blavet, 27 miles west of Vannes. W. Long. 3. 18. N. Lat. 47. 40.

Port-Mahon. See MINORCA.

PORTO. See OPORTO.

Porto-Bello, a town of North America, situated in N. Lat. 9. 3. W. Long. 79. 45. close to the sea, on the declivity of a mountain, which surrounds the whole harbour. This harbour is so large, deep, and safe, that Columbus, who first discovered it, gave it the name of *Porto-Bello*, or the "Fine Harbour," which is now commonly used to denote the town. The number of the houses is about 130; most of them of wood, large and spacious, forming one long street along the strand, with other smaller ones crossing it. The governor of the town is always a gentleman of the army, subordinate to the president of Panama; but having under him the commandants of the forts that defend the harbour. At the east end of the town, on the road to Panama, is a place called *Guinea*, where all the negroes of both sexes, whether slaves or free, have their habitations. This place is very much crowded when the galleons are here, most of the inhabitants of the town quitting their houses entirely for the sake of letting them; while others content themselves with a small part, in order to make money of the rest. The Mulattoes and other poor families also remove either to Guinea, or to cottages already erected near it, or built on the occasion. Great numbers of artificers likewise flock to Porto-Bello from Panama to work at their respective callings during the fair, lodge in Guinea for cheapness. Towards the sea, in a large tract between the town and Gloria castle, barracks are erected, in most of which the ships crews keep stalls of sweetmeats, and other kinds of eatables, brought from Spain; but at the conclusion of the fair, when the ships put to sea, all these buildings are taken down, and the town returns to its former tranquillity and emptiness. In 1739, the harbour was defended by a castle and two forts; which were all demolished by admiral Vernon, who, with six ships only, made himself master of this port. The country about Porto-Bello is over-run with mountains and impenetrable forests, except a few valleys, in which are some scattered farms. Among the mountains that surround the harbour is one distinguished by the name of *Capiro*, and by its superior loftiness is a sort of barometer to the country, by foretelling every change of weather. Its top is always covered with clouds, of a density and darkness seldom seen in those of the atmosphere. When these clouds thicken, increase their blackness, and sink below their usual station, it is a sure sign of a tempest; while, on the other hand, their clearness and ascent as certainly indicate the approach of fair weather. These changes are very sudden and frequent here. The summit of the mountain is scarce ever clear from clouds; and when it happens, it is only, as it were, for an instant. Except in the time of the fair, all the inhabitants of Porto-Bello do not amount to 3000; half of whom are Indians, Mulattoes, or Negroes; the Spaniards of any substance

not choosing to reside in a place so extremely unhealthy and fatal even to the lives of the natives. Ulloa tells us, that the cattle brought hither from Panama or Carthagena, lose their flesh so fast in the best pastures, as to become scarce eatable: he assures us also, that neither horses nor asses are bred here. The heat, indeed, is excessive; and the torrents of rain are so dreadful, sudden, and impetuous, that one not accustomed to them would imagine a second deluge was coming. These torrents are also accompanied with frightful tempests of thunder and lightning, the awfulness of the scene being heightened by the repercussions from the mountains, and the shrieks and howlings of multitudes of monkeys of all kinds which inhabit the surrounding woods.

Fresh water pours down in streams from the mountains, some running without the town, and others crossing it. These waters are very light and digestive; qualities which in other countries would be very valuable, but are here pernicious, producing dysenteries, which the patient seldom survives. However, these rivulets, formed into reservoirs, serve the purposes of bathing, which is here found to be very conducive to health.

As the forests almost border on the houses of the streets, tigers often make incursions into the streets during the night, carrying off fowls, dogs, and other domestic animals, and sometimes even children have fallen a prey to them. Besides the snares usually laid for them, the Negroes and Mulattoes, who fell wood in the forests of the mountains, are very dexterous in encountering them; and some, for a slender reward, even seek them in their retreats.

The town of Porto-Bello, which is thinly inhabited by reason of its noxious air, the scarcity of provisions, and the barrenness of the soil, becomes, after the arrival of the galleons, one of the most populous towns in the world. He who had seen it quite empty, and every place wearing a melancholy aspect, would be filled with astonishment to see the bustling multitudes in the time of the fair, when every house is crowded, the squares and streets encumbered with bales of merchandise and chests of gold and silver, the harbour full of ships and vessels, some loaded with provisions from Carthagena, and others with the goods of Peru, as cocoa, Jesuit's bark, Vicuna wool, and bezoar stones; and this town, at all other times detested for its deleterious qualities, becomes the staple of the riches of the Old and New World, and the scene of one of the most considerable branches of trade in the universe. Formerly the fair was limited to no particular time; but as a long stay in such a sickly place extremely affected the health of the traders, his Catholic majesty transmitted an order that the fair should not last above 40 days; and that, if in that time the merchants could not agree on their rates, those of Spain should be allowed to carry their goods up the country to Peru: and accordingly, the commodore of the galleons has orders to re-embark them, and return to Carthagena; but otherwise, by virtue of a compact between the merchants of both kingdoms, and ratified by the king, no Spanish trader is to send his goods, on his own account, beyond Porto-Bello. The English were formerly allowed to send a ship annually to this fair, which turn-

Porto.

Porto,
Portrait.

ed to great account; and, whilst the assiento contract subsisted, either with the English or the French, one of their principal factories was at Porto-Bello.

PORTO-Farina, a port about 12 miles from Cape Carthage, in the bay of Tunis, where formerly the large vessels belonging to the bey were fitted out, and laid up on their return from a cruise. This harbour is safe from the weather, and opens into a large lake, formed by the Mejerdah, which runs through into the sea.—The north-west wind, which blows right upon the shore, together with the soil brought down by the river, which has the same quality as the Nile of overflowing its banks, has formed a bar, so that only small vessels can now enter. It is still the arsenal where the naval stores are kept. E. Long. 10. 16. N. Lat. 37. 12.

PORTO-Farraio, a handsome town of Italy, in the isle of Elba, with a good citadel. It is very strong, and seated on a long, high, steep point of land, to the west of the bay of the same name, which has two forts. It belongs to the great duke of Tuscany, who always keeps a good garrison there. E. Long. 10. 37. N. Lat. 48. 55.

PORTO-Longone, a small but very strong town of Italy, and in the isle of Elba, with a good harbour, and a fortress upon a rock almost inaccessible. The king of Naples has a right to put a garrison therein, though the place belongs to the prince of Piombino. It is seated on the east end of the island, eight miles south-west of Piombino. E. Long. 10. 10. N. Lat. 42. 52.

PORTO-Santo, an island of the Atlantic Ocean, on the coast of Africa, and the least of those called the *Madeiras*. It is about 15 miles in circumference, and produces but little corn; however, there are oxen and wild hogs, and a vast number of rabbits. There are trees which produce the gum or resin called *dragon's blood*; and there is likewise a little honey and wax, which are extremely good. It has no harbour, but good mooring in the road. It belongs to the Portuguese, and is 300 miles west of the coast of Africa. W. Long. 16. 20. N. Lat. 32. 58.

PORTO-Seguro, a government of South America, on the eastern coast of Brazil; bounded on the north by the government of Rio-dos-Hilios, on the east by the North Sea, on the south by the government of Spiritu-Santo, and on the west by the Tupicks. It is a very fertile country, and the capital town is of the same name. It is built on the top of a rock, at the mouth of a river, on the coast of the North Sea, and is inhabited by Portuguese. W. Long. 38. 50. S. Lat. 17. 0.

PORTO-Vekio, is a sea-port town of Corsica, in the Mediterranean Sea, seated on a bay on the eastern coast of the island. It is 12 miles from Bonifacio, and 40 north of Sardinia. E. Long. 9. 20. N. Lat. 41. 42.

PORTO-Venereo, is a town of Italy, on the coast of Genoa, at the entrance of the gulph of Spetia. It is seated on the side of a hill, at the top of which there is a fort. It has a very good harbour, and is 45 miles south-east of Genoa. E. Long. 9. 38. N. Lat. 44. 5.

PORTRAIT, or **PORTRAITURE**, in painting, the representation of a person, and especially of a face, done from the life. In this sense we use the term *portrait-painting*, in contradistinction to *history-painting*, where a resemblance of persons is usually disregarded. Por-

traits, when as large as the life, are usually painted in oil-colours; sometimes they are painted in miniature with water-colours, crayons, pastils, &c. See **PAINTING**, p. 641.

PORTREE, is a small village, containing a church and a very few houses, with an excellent bay and a good harbour, in the Isle of Sky. "The entrance of the bay (Mr Knox tells us) represents agreeable landscapes on both sides, with excellent pasture.

'The bay of Portree (says Mackenzie), off the houses, is an exceeding good harbour for a few ships of any size; it is well sheltered, the ground good, the depth from five to 14 fathoms, and nothing to fear coming in but a rock, about half a cable's length from Airdrachig Point, on the starboard as you enter the anchorage, part of which is always above water.' It is the only port or harbour to a very considerable division of Sky, on the east side. From this opening to the northern extremity, a course of 20 miles, the shore is one continued line of lofty rocks, where no ship can find refuge in the mildest weather, and where inevitable danger await the mariners in rough weather.

"James V. of Scotland and several of his nobility landed here, when they made the tour of the Hebrides in 1535; from which circumstance, this fine bay has got the honourable name of *Portree*."

Mr Knox tells us, "that the country round this village, though mountainous, is well inhabited; it raises much grain, and many cattle. Here the late Sir James Macdonald had marked out the lines of a town; and government, it is said, promised to assist him in the work with 500l.; but the death of that gentleman put an end to these promising appearances, and matters remain in *statu quo*."

PORTSMOUTH, a sea-port town in Hampshire, with one of the most secure and capacious harbours in England, being defended by a numerous artillery, both on the sea and land-side, and very good fortifications. A great part of the royal navy is built here; and here are some of the finest docks, yards, and magazines of naval stores, in Europe. It is seated in the isle of Portsey, being surrounded by the sea except on the north side, where there is a river which runs from one arm of it to the other. It is much resorted to on account of the royal navy, whose usual rendezvous is at Spithead, which is at the east end of the isle of Wight, and opposite to Portsmouth. There is a draw-bridge over the river, and it has always a good garrison. It is governed by a mayor, 12 aldermen, and burgesses, and sends two members to parliament. It has one church, and two chapels, one in the garrison, and one in the Common, for the use of the dock, and others, besides several meeting-houses of the dissenters. The houses of Portsmouth amount to about 2000, and the inhabitants to about 12,000. W. Long. 1. 1. N. Lat. 50. 47.

The town is supposed to receive its name from Port, a famous Saxon chieftain, who, A. D. 501. landed here with his two sons. It made a considerable figure in the time of the Saxons; and from the utility of its situation, was highly favoured by all the monarchs of the Norman line. It was incorporated, and became also a parliamentary borough. In the reign of Edward III. it was in a very flourishing state; but, A. D. 1338, in the very same reign, was burned by the French, when

Survey.

when that monarch, which was afterwards ratified by king Richard II. forgave the inhabitants a debt, and remitted their fee-farm for 10 years: within which space they so recovered themselves, as to equip a squadron, which sailed into the mouth of the Seine, sunk two ships, and brought away a great booty. The singular excellence of its port, and the convenience of fitting out fleets from thence in the time of a French war, induced Edward IV. to think of fortifying it, as he actually, in some measure, did; which fortifications were farther carried on by Richard III. But king Henry VII. was the first who settled a garrison therein; which was increased, and the place made still stronger, in the reign of Henry VIII. who had a great dock there, wherein was built the Henry Grace de Dieu, which was the largest ship in the navy of his time. The same monarch, remarkably attentive to the security of all maritime places, built what is now called *South-Sea castle*, for the protection of this.—The improvements made here in the reign of Q. Elizabeth were much superior to all these. King Charles II. after his restoration, directed great alterations, established new docks and yards, raised several forts, and fortified them after the modern manner; which works were augmented under his brother's reign. Notwithstanding this, king William directed likewise fresh alterations and additions; and succeeding princes, following his example, have, at a large expence, extended these fortifications, and taken in a vast deal of ground: so that it is at present, as the importance of the place deserves, the most regular fortress in Britain; and, as it cannot be effectually attacked by sea, may be justly esteemed impregnable.

PORTSMOUTH, the largest town in the state of New Hampshire in North America. It stands on the south-east side of Piscataqua river, about two miles from the sea, and contains about 600 houses, and 4400 inhabitants. The town is handsomely built, and pleasantly situated. Its public buildings are, a court house, two churches for Congregationalists, one for Episcopalians, and one other house for public worship. Its harbour is one of the finest on the continent, having a sufficient depth of water for vessels of any burthen. It is defended against storms by the adjacent land, in such a manner, as that ships may securely ride there in any season of the year. Besides, the harbour is so well fortified by nature, that very little art will be necessary to render it impregnable. Its vicinity to the sea renders it very convenient for naval trade. A light-house, with a single light, stands at the entrance of the harbour.

PORTSOY, is a handsome sea-port town, situated on a small promontory running into the sea, on the south side of the Murray Frith, in Scotland, about six miles from Cullen, and seven west from Banff. It sends out several fishing vessels, particularly for the Hebride white fishery, and exports a considerable quantity of grain. A manufacture of stocking and sewing thread is also carried on to a considerable amount for the London and Nottingham markets. In the neighbourhood is a stratum of marble, of a dark greenish colour, in which, it is said, the curious substance called ASBESTOS, or earth-flax, has been found. From the asbestos a sort of incumbustible cloth is made, which is purified by throwing it into the fire. W. Long. 2. 5. N. Lat. 57. 50.

PORTUGAL, the most westerly kingdom of Eu-

rope, bounded on the west and south by the Atlantic Ocean, and on the east and north by Spain; extending about 310 miles in length, and 150 in breadth.

By modern writers, we find this country constantly styled in Latin *Lusitania*; and it is certain, that anciently a country of Spain went by that name; but it does not by any means appear that the country called by the ancients *Lusitania* had the same boundaries with the modern kingdom of Portugal. Before Augustus Cæsar, *Lusitania* seems to have been bounded on the north by the ocean, and on the south by the river Tagus; by which means it comprehended all Galicia, and excluded two of the six provinces of Portugal. But in the more strict and restrained sense of the word, it was bounded on the north by the Durus, now the Douro, and on the south by the river Anas, now the Guadiana; in which sense it was not quite so long as modern Portugal, but considerably broader.

The commonly received opinion with regard to the etymology of the word *Portugal*, is, that a great number of Gauls landed at Porto, or Oporto, whence it received the name of *Portus Gallorum*, or *the Port of the Gauls*; and in process of time that name gradually extended over the whole country, being softened, or rather shortened, into *Portugal*. But the time when this event happened, the reason why these Gauls came thither, and what became of them afterwards, are all particulars which lie buried in oblivion. It is alleged, however, that, upon an eminence which overlooks the mouth of the river Douro, there stood an ancient town called *Cale*, strong and well peopled, but ill suited for trade; and this occasioned the construction of a lower town or hamlet, which was called *Portus Cale*, that is, *the haven of Cale*; and, in process of time, *Portucalia*. At length, becoming so considerable as to merit an episcopal chair, the bishops subscribed themselves, as the records of ancient councils testify, *Portucalenses*, and the name of the city was transferred to the diocese. It is true, that these bishops afterwards changed their title, and subscribed themselves *Portuenses*, that is, *bishops of Porto*. But the facts just mentioned are actually recorded in authentic histories; and as the diocese of Portucalia contained in a great measure that little country in which the sovereignty originally began, the name extended itself, together with the acquisitions of the sovereigns, and has remained to the kingdom, though the diocese itself has changed its name, and possibly on that very account.

Portugal, though even yet but a small kingdom, was originally much smaller. The Spanish and Portuguese historians agree, that Don Alonso, king of Leon and Castile, and son to Don Ferdinand the Great, bestowed his daughter Donna Theresa in marriage upon an illustrious stranger, Don Henry, and gave him with her the frontier province which he had conquered from the Moors, small indeed in extent, but excellently situated, and so pleasant and fertile, that it has sometimes been styled *Medulla Hispanica*, or *the marrow of Spain*. To this territory was added the title of *Count*; but authors are much divided about the time that this stranger came into Spain, and who he was. However, the authors of the Universal History make it pretty evident, that he was a grandson of Robert the first duke of Burgundy. The manner in which

Originally
only a
small king-
dom,

Portugal, which he obtained the principality above-mentioned is related as follows :

The king, Don Alonso, apprehensive that his success in taking the city of Toledo would bring upon him the whole force of the Moors, sent to demand assistance from Philip I. of France, and the duke of Burgundy, whose daughter he had married. His request was granted by both princes; and a numerous body of troops was speedily collected for his service, at whose head went Raymond count of Burgundy, Henry younger brother of Hugh duke of Burgundy, Raymond count of Tholouse, and many others. They arrived at the court of Don Alonso in the year 1087, where they were received and treated with all possible marks of esteem; and having in the course of two or three years given great proofs of their courage and conduct, the king resolved to bestow his only daughter named *Urraca*, then a mere child, being at most in her ninth year, upon Raymond count of Burgundy, and assigned them the province of Galicia for the support of their dignity. About four years after, Don Alonso being very desirous to express his gratitude to Henry of Burgundy, gave him in marriage a natural daughter of his, born while he remained in exile at Toledo, whose name was *Donna Theresa*; and upon this marriage, he gave up in full property the country which has been already mentioned.

Henry of Burgundy the first count of Portugal.

The new sovereign, with his consort, fixed their residence in the town of Guimaraez, pleasantly situated on the banks of the river Ave. The remains of an ancient palace belonging to their successors are still to be seen; and on account of its having been anciently the capital, the king, Don Denis, granted the inhabitants an immunity from taxes, which they still enjoy.

The Portuguese, now finding themselves independent, immediately began, like other nations, to attempt the subjection of their neighbours. Henry is said to have performed great exploits against the Moors; but the accounts of them are so indistinct, that they cannot be taken notice of here. He died in 1112; and was succeeded by his son Don Alonso, then an infant in the third year of his age. In his minority, the kingdom was governed by his mother Donna Theresa, assisted by two able ministers. During the first nine years of their administration, nothing remarkable happened; but after that period, some differences took place between the queen regent (for she had assumed the title of queen after her father's death) and Urraca queen of Castile. Theresa insisted, that some part of Galicia belonged to her in virtue of her father's will; and therefore seized on Tuy, an episcopal town, and a place of some consequence. Urraca, having assembled a numerous army, went in person into Galicia; upon which Theresa was obliged to abandon Tuy, and take shelter in one of her own fortresses. The consequences, in all probability, would have been fatal to the new kingdom, had not the archbishop of Compostella, without whose assistance Urraca could do nothing, demanded leave to retire with his vassals. This offended the queen to such a degree, that she threw him into prison; which act of violence excited such a commotion among her own subjects, that the Portuguese were soon delivered from their apprehensions. Queen Theresa fell immediately after into a similar error, by throwing into prison the arch-

Differences with Castile.

bishop of Braga, who had not espoused her cause so warmly as she had expected. The bishop, however, was quickly delivered by a bull from the pope, who also threatened the kingdom with an interdict; and this was the first remarkable offence which Theresa gave her subjects.

Soon after this, Queen Urraca died, and all differences were amicably settled at an interview between Theresa and Don Alonso Raymond, who succeeded to the kingdom of Castile. But, in 1126, the king of Castile being obliged to march with the whole strength of his dominions against his father-in-law the king of Navarre and Arragon, Theresa took the opportunity of again seizing upon Tuy; but the king soon returning with a superior army, she was again obliged to abandon her conquest. But the greatest misfortune which befel this princess, was a quarrel with her own son Don Alonso Enriquez. It does not appear indeed that Theresa had given him any just cause of offence; but it is certain that a civil war ensued, in which the queen's forces were totally defeated, and she herself made prisoner, in which situation she continued during the remainder of her life.

Enriquez having thus attained to the free and full possession of his dominions, made several attempts upon some places in Galicia, but without success; so that he was at last constrained to make peace with Alonso king of Castile and Leon, who had assumed the title of *Emperor of the Spains*; the more especially as his dominions happened to be at that time invaded by the Moors.—The number of infidels was so great, that the count of Portugal had little hopes of subduing them; but a plague breaking out in the Moorish army, they were obliged to retreat; after which he reduced several places belonging to that nation. But, in the mean time, the emperor Don Alonso, breaking into the Portuguese territories, destroyed every thing with fire and sword. The king of Portugal surprised and cut off a considerable part of his army; which, however, did not hinder the emperor from marching directly towards him.—But, at the intercession of the pope's legate, all differences were accommodated, and a peace concluded; all places and prisoners taken on both sides being delivered up.

Don Alonso's wars with the Moors and king of Castile.

In the mean time, the progress of the Christian arms in Spain being reported to Abu-Ali Texefien, the miramolin or chief monarch of the Moors in Barbary, he directed Ismar, or Ishmael, his lieutenant in Spain, to assemble all the forces in the southern provinces, and drive the Christians beyond the Douro. Ishmael immediately began to prepare for putting these orders in execution; and having added a considerable body of troops brought from Barbary to those whom he had raised in Spain, the whole army was very numerous. He was met by Don Alonso of Portugal, in the plains of Ourique, on the banks of the river Tayo; and Ishmael took all possible means to prevent the Christians from passing that river, because his own cavalry, in which the strength of his army chiefly consisted, had thus more room to act. The Portuguese forces were very inconsiderable in number in comparison of the Moors; but Ishmael, being too confident of victory, divided his army into 12 bodies, and disposed them in such a manner as might best prevent the flight, not sustain the attack, of the Christians. The consequence was, that

Victory of Ourique.

Portugal. that his army was overthrown with incredible slaughter, and a vast number of prisoners taken, among whom were 1000 Christians, of the sect styled *Mozarabians*, whom, at the request of Theotonus, prior of the Holy Cross, Don Alonso set at liberty with their wives and children, and procured them settlements in his own dominions.

⁸
Don Alonso assumes the title of king. After this signal victory, gained in the year 1139, Don Alonso was proclaimed king by his soldiers, and ever after retained that title, renouncing all kind of subjection to the crown of Spain. Being very desirous, however, of bringing down the power of the emperor, he entered into a league with Raymond count of Barcelona and regent of the kingdom of Arragon against that prince. In consequence of this treaty, he entered Galicia with a considerable force on one side, while Don Raymond did the same on the other. Neither of these enterprises, however, succeeded. The Portuguese monarch met with a severe check in his expedition into Galicia, where he received a dangerous wound, and had some of the nobility who attended him taken prisoners. At the same time he received intelligence that the Moors had invaded his dominions, so that he was obliged to retire; which, however, was not done in sufficient time to prevent the strong fortress of Leyria from falling into their hands. This fortress they demolished, and put all the garrison to the sword; but the king caused it to be rebuilt stronger than before, and put a more numerous garrison into it; however, he undertook nothing farther this campaign. The war continued with various success till the year 1145, when the king projected an enterprise against Santaren, a strong city about 12 miles from Lisbon. In this he luckily succeeded: and by that means gained a considerable tract of country, and a strong barrier to his dominions.

⁹
Reduces Lisbon and 12 other cities. After this success Don Alonso caused himself with much ceremony to be chosen and crowned king of Portugal before an assembly of the states, where he also solemnly renounced all dependence on the crown of Spain, declaring, that if any of his successors should condescend to pay tribute or to do homage to that crown, he was unworthy of enjoying the kingdom of Portugal. The next year the king undertook the recovery of Lisbon out of the hands of the Moors; and concerning this expedition there are such numbers of fables, that it is almost impossible to come at the truth. What can be gathered from these accounts is, that he undertook the siege with a small army, and was able to make but little progress in it, partly from the strength of the place, and partly from the numerous garrison by which it was defended. At length, fortunately for Don Alonso, a fleet of adventurers, French, English, Germans, and Flemings, that were going to the Holy Land, anchored at the mouth of the river Tagus, whose assistance he demanded, as not altogether foreign to their design of making war on the infidels. His request was readily granted; and, with their assistance, Lisbon was speedily reduced; which conquest so much raised the reputation of this monarch, and brought such numbers to recruit his army, that before the end of the year 1147 he had reduced 12 other considerable cities.

¹⁰
Has his regal dignity confirmed by the pope. For many years after this, Don Alonso was successful in all his undertakings. He settled the internal government of his kingdom, procured a bull from pope

VOL. XV.

Alexander III. confirming his regal dignity, undertook many successful expeditions against the Moors, and became master of four of the six provinces which compose the present kingdom of Portugal. In all his undertakings he was assisted by the councils of his queen Matilda, who was a woman of great capacity, and sufficient for the government of the kingdom in her husband's absence. By her he had a numerous offspring, particularly three daughters; the eldest of whom, Donna Mafalda or Mathilda, was married to the king of Arragon; the second, Urraca, to Don Ferdinand king of Leon; and the third, Theresa, to Philip earl of Flanders. In 1166, however, the king thought proper, from what provocation we know not, to invade the dominions of his son-in-law Don Ferdinand; and possessed himself of Limmia and Turon, two cities of Galicia, in which he put strong garrisons. The next year, elated with his success, he marched with a numerous army towards Badajos, which he invested; on the news of which, Don Ferdinand, who had assembled a large army at Ciudad Rodrigo, marched to its relief. Yet before he could come within sight of it, it had surrendered to the king of Portugal; upon which Don Ferdinand came to a resolution of besieging his antagonist in his newly conquered city; which Don Alonso perceiving, endeavoured to draw out his forces into the field. Though he was at that time upwards of 70 years of age, he was himself on horseback, and pushing forwards at the head of his horse to get out at the gate, he struck his leg against one of the bolts with such violence that the bone was shattered to pieces. This accident occasioned such confusion, that the Portuguese troops were easily beaten, and Don Alonso was taken prisoner. He was exceedingly mortified by this disgrace, especially as he had no great reason to expect very kind treatment from his son-in-law. However, the king of Leon behaved towards him with the greatest respect and affection. He desired him to lay aside all thoughts of business, and attend to his cure; but finding him restless and impatient, he assured him that he expected nothing more than to have things put into the same condition as before the war, and that they might live in peace and friendship for the future: to which the king of Portugal most readily assented; but returned to his dominions before his cure was perfected, which was the cause of his being lame all the rest of his life. However, this did not abate his military ardour; for, notwithstanding this inconvenience, his courage transported him into the field whenever he was called by the interest of his subjects. Towards the end of his reign, an opportunity seemed to present itself of obtaining once for all an entire release from the disagreeable pretensions of the king of Leon, who, it seems, had insisted on the king of Portugal's doing homage for his kingdom. The opportunity which now presented itself was a quarrel between the king of Leon and his nephew Don Alonso king of Castile. The latter asked assistance from the king of Portugal, which was readily granted. But Don Ferdinand, having received intelligence that the infant Don Sancho (the king's eldest son) was advancing towards Ciudad Rodrigo, assembled his troops on that frontier with such diligence, that he was enabled to attack him unexpectedly, and entirely defeated him. Understanding, however, that Don Sancho was recruiting his forces with great diligence,

Portugal.

¹¹
His unsuccessful war with Don Ferdinand of Spain.

¹²
Don Sancho's success against the Moors.

¹³ Portugal. he let him know that they might be much better employed against the infidels, who remained careless and unprepared, expecting the issue of the war. Don Sancho made a proper use of this advice; and, after making some motions to amuse the enemy, made a sudden irruption into Andalusia, penetrating as far as Triana, one of the suburbs of Seville. The Moors assembled their forces in order to attack him on his retreat; but Don Sancho having first fatigued them by the celerity of his march, at length chose a strong camp, and, having given his troops time to repose, drew them out and offered the enemy battle. The Moors accepted the challenge, but were entirely defeated; and Don Sancho returned into Portugal with spoils to an immense amount. For some years after the war was continued without any remarkable event; but, in 1184, Joseph king of Morocco, having already transported multitudes of men from Barbary, at length followed in person with a prodigious army, and carried all before him as far as the Tajo. He appeared before the city of Santaren; but having wearied and reduced his army by unsuccessful assaults on that place, he was attacked by the Portuguese forces assisted by Ferdinand of Leon, entirely defeated, and himself killed. By this victory, the Portuguese were left at liberty to improve the interior part of their country, and fortify their frontiers; and during this interval, the king died in the 76th year of his age, in the year 1185.

¹³ His wife administered when king.

Don Alonzo was succeeded by his son Don Sancho I. Of this prince it is remarkable, that, before he ascended the throne, he was of a restless and warlike disposition; but no sooner did he come to the possession of the kingdom, than he became a lover of peace, and began with great assiduity to repair the cities that had suffered most by the war, and to repeople the country around them. By his steady attention to this, he in a very short time quite altered the appearance of his territories, and procured to himself the glorious title of *The restorer of cities, and father of his country*. In the year 1189, a fleet, composed for the most part of English vessels, but having on board a great number of adventurers of other nations bound to the Holy Land, entered the river of Lisbon. They were very kindly received, and supplied with all kinds of refreshments by Don Sancho, who took this opportunity of soliciting them to assist him in a design he had formed of attacking the city of Silves in Algarve; to which they readily yielded. Having joined a squadron of his own galleys, and marched a body of troops by land, the place was reduced, and the English, according to agreement, rewarded with the plunder. But, in a short time, the Moors from Africa having again invaded Portugal, the town was several times taken and retaken, till at last Don Sancho, being sensible of the difficulties that would attend the keeping of it, caused it to be demolished. His last enterprise was the reduction of Elvas; soon after which he died with the reputation of the best economist that ever sat on the throne of Portugal. With the character of being rather liberal than avaricious, he had amassed a treasure of more than 700,000 crowns in ready money, besides 1400 merks of silver and 100 of gold plate, which he disposed of some time before his death. He was interred by his own command with much less pomp than his father, in the cathedral of Coimbra; and when his body was taken up 400 years

after by order of the king Don Emanuel that it might be laid in a new tomb, it was found uncorrupted.

The history of Portugal affords scarce any event of importance till the year 1289; when, in the reign of Don Denis, a difference commenced with Castile, which subsisted for a long time. Frequent reconciliation took place; but these were either of very short duration, or never sincere. At length, in the reign of John I. Don Juan of Castile, who had also pretensions to the crown of Portugal, invaded that kingdom at the head of the whole force of his dominions, and with the flower of the Castilian nobility entered the province of Alentejo. According to the Portuguese historians, he besieged the city of Elvas without effect; which disappointment enraged him to such a degree, that he determined next year to invade Portugal a second time, and ruin all the country before him. Accordingly, having collected an army of 30,000 men, he invaded Portugal, took and ruined several places, while king John lay inactive, with a small army, waiting for some English succours which he expected. At last he ventured an engagement with the forces which he had; and, notwithstanding the great superiority of the enemy, obtained a complete victory; after which he made an irruption into Castile, and had the good fortune to gain another battle, which fixed him firmly on the throne of Portugal. The Castilians were obliged to consent to a truce of three years, which was soon after improved into a lasting peace.

¹⁴ Differences with Castile.

¹⁵ The Castilians entirely defeated.

In 1414, King John undertook an expedition against the Moors in Barbary, where he commanded in person; but before he set out, his queen (Philippa the daughter of John duke of Lancaster) died of grief at the thoughts of his absence. The expedition, however, proved successful, and the city of Ceuta was taken from the Moors almost at the first assault: but scarce had the king left that country, when the princes of Barbary formed a league for the recovery of it; and though they were defeated by the young princes of Portugal, whom John again sent into Barbary, yet the trouble of keeping it was so great, that some of the king's council were of opinion that the town should be demolished. But John, having considered the arguments on both sides, determined to keep the city; and therefore enlarged and strengthened the fortifications, augmenting his forces there to 6000 foot and 2500 horse, which he hoped would be sufficient for keeping off the attacks of the Moors.

¹⁶ The city of Ceuta taken from the Moors.

King John died in 1428, and was succeeded by his eldest son Edward. He undertook an expedition against Tangier in Barbary: but the event proved very unfortunate; the Portuguese being so shut up by the Moors, that they were obliged to offer Ceuta back again, in order to obtain leave to return to Portugal. The king's son, Don Ferdinand, was left as an hostage for the delivery of Ceuto; but was, with the utmost cruelty and injustice, left in the hands of the infidels, by the king and council of Portugal, who constantly refused to deliver up the place. Many preparations indeed were made for recovering the prince by force; but before any thing could be accomplished the king died in 1430, which put an end to all these designs. See PEDRO (Don).

The war with Barbary continued at intervals, but with little success on the part of the Portuguese; and till covered,

¹⁷ Passage to the East Indies discovered.

Portugal. till the year 1497, there is no event of any consequence recorded in the history of Portugal. This year was remarkable for the discovery of the passage to the East Indies by the Cape of Good Hope. The enterprising spirit of the Portuguese had prompted them to undertake voyages along the coast of Africa for a considerable time before; but when they undertook their first voyage of discovery, it is probable that they had nothing farther in view than to explore those parts of the coast of Africa which lay nearest to their own country. But a spirit of enterprise, when roused and put in motion, is always progressive; and that of the Portuguese, though slow and timid in its first operations, gradually acquired vigour, and prompted them to advance along the western shore of the African continent, far beyond the utmost boundary of ancient navigation in that direction. Encouraged by success, it became more adventurous, despised dangers which formerly appalled it, and surmounted difficulties which it once deemed insuperable. When the Portuguese found in the torrid zone, which the ancients had pronounced to be uninhabitable, fertile countries, occupied by numerous nations; and perceived that the continent of Africa, instead of extending in breadth towards the west, according to the opinion of Ptolemy, appeared to contract itself, and to bend eastwards, more extensive prospects opened to their view, and inspired them with hopes of reaching India, by continuing to hold the same course which they had so long pursued.

son's India.**

18
**Circum-
stances
which faci-
litated the
discovery.**

After several unsuccessful attempts to accomplish what they had in view, a small squadron sailed from the Tagus under the command of Vasco de Gama, an officer of rank, whose abilities and courage fitted him to conduct the most difficult and arduous enterprises. From unacquaintance, however, with the proper season and route of navigation in that vast ocean through which he had to steer his course, his voyage was long and dangerous. At length he doubled that promontory, which, for several years had been the object of terror and of hope to his countrymen. From that, after a prosperous navigation along the south-east of Africa, he arrived at the city of Melinda, and had the satisfaction of discovering there, as well as at other places where he touched, people of a race very different from the rude inhabitants of the western shore of that continent, which alone the Portuguese had hitherto visited. These he found to be so far advanced in civilization and acquaintance with the various arts of life, that they carried on an active commerce, not only with the nations on their own coast, but with remote countries of Asia. Conducted by their pilots, who held a course with which experience had rendered them well acquainted, he sailed across the Indian ocean, and landed at Calcut, on the coast of Malabar, on the 22d of May 1498, ten months and two days after his departure from the port of Lisbon.

19
**The king
of the
country
jealous of
his new vi-
sitors.**

The samorin, or monarch of the country, astonished, at this unexpected visit of an unknown people, whose aspect, and arms, and manners, bore no resemblance to any of the nations accustomed to frequent his harbours, and who arrived in his dominions by a route hitherto deemed impracticable, received them at first with that fond admiration which is often excited by novelty; but in a short time, from whatever motives, he formed various schemes to cut off Gama and his followers. The

Portuguese admiral, however, was not to be over-reached by such politics as his. From every danger to which he was exposed, either by the open attacks or secret machinations of the Indians, he extricated himself with singular prudence and dexterity, and at last sailed from Calcut with his ships, loaded not only with the commodities peculiar to that coast, but with many rich productions of the eastern parts of India. He returned to Portugal in two years after his sailing from the Tagus, but with a great loss of men; for out of 148 persons whom he took out with him, only 55 returned. The king received him with all possible testimonies of respect and kindness; created him count of Videgueira; and not only declared him admiral of the Indies, but made that office hereditary in his family.

Portugal.

On the first intelligence of Gama's successful voyage, the Venetians, with the quick-sighted discernment of merchants, foresaw the immediate consequence of it to be the ruin of that lucrative branch of commerce which had contributed so greatly to enrich and aggrandize their country; and they observed this with more poignant concern, as they were apprehensive that they did not possess any effectual means of preventing, or even retarding, its operation.

20
**The Vene-
tians dread
the ruin of
their com-
merce.**

The hopes and fears of both were well-founded. The Portuguese entered upon the new career opened to them with activity and ardour, and made exertions, both commercial and military, far beyond what could have been expected from a kingdom of such inconsiderable extent. All these were directed by an intelligent monarch, capable of forming plans of the greatest magnitude with calm systematic wisdom, and of prosecuting them with unremitting perseverance. The prudence and vigour of his measures, however, would have availed little without proper instruments to carry them into execution. Happily for Portugal, the discerning eye of Emanuel selected a succession of officers to take the supreme command in India, who, by their enterprising valour, military skill, and political sagacity, accompanied with disinterested integrity, public spirit, and love of their country, have a title to be ranked with the persons most eminent for virtue and abilities in any age or nation. Greater things perhaps were achieved by them than were ever accomplished in so short a time. Within 24 years only after the voyage of Gama, the Portuguese had rendered themselves masters of the city of Malacca, in which the great staple of trade carried on among the inhabitants of all those regions in Asia, which Europeans have distinguished by the general name of the *East Indies*, was then established. This conquest secured to them great influence over the interior commerce of India, while, at the same time, by their settlements at Goa and Diu, they were enabled to engross the trade of the Malabar coast, and to obstruct greatly the long established intercourse of Egypt with India by the Red Sea. In every part of the east they were received with respect; in many they had acquired the absolute command. They carried on trade there without rival or controul; they prescribed to the natives the terms of their mutual intercourse; they often set what price they pleased on the goods which they purchased; and were thus enabled to import from Indostan and the regions beyond it, whatever is useful, rare, or agreeable, in greater abundance, and of more various kinds, than had been known formerly in Europe.

21
**Account of
the settle-
ment of
the Portu-
guese in
India.**

Portugal.

Not satisfied with this ascendant which they had acquired in India, the Portuguese early formed a scheme no less bold than interested, of excluding all other nations from participating of the advantages of commerce with the east; and they accomplished one half of what their ambition had planned.

22
Opposition
made by
the Venetians.

In consequence of this, the Venetians soon began to feel that decrease of their own Indian trade which they had foreseen and dreaded. In order to prevent the farther progress of this evil, they incited the Soldan of the Mameluks to fit out a fleet in the Red Sea, and to attack those unexpected invaders of a gainful monopoly, of which he and his predecessors had long enjoyed undisturbed possession. The Portuguese, however, encountered his formidable squadron with undaunted courage, entirely defeated it, and remained masters of the Indian ocean. They continued their progress in the east almost without obstruction, until they established there a commercial empire; to which, whether we consider its extent, its opulence, the slender power by which it was formed, or the splendor with which the government of it was conducted, there had hitherto been nothing comparable in the history of nations. Emanuel, who laid the foundation of this stupendous fabric, had the satisfaction to see it almost completed. Every part of Europe was supplied by the Portuguese with the productions of the east; and if we except some inconsiderable quantity of them, which the Venetians still continued to receive by the ancient channel of conveyance, Europe had no longer any commercial intercourse with India, and the regions of Asia beyond it, but by the Cape of Good Hope.

23
Inquisition
introduced
into Portugal.

In September 1522, King Emanuel died of an epidemical fever, and was succeeded by his son John III. The most remarkable transaction of this prince's reign was the introduction of the inquisition into his dominions. This happened in the year 1525, or, as some say, in 1535. A famine happening to cease in a short time after it was introduced, the priests persuaded the ignorant multitude that it was a blessing from heaven on account of the erecting such an holy tribunal. However, it was not long before the bulk of the nation perceived what kind of a blessing the inquisition was: but their discernment came too late; for by that time the inquisitors had acquired such power, that it became equally dangerous and ineffectual to attempt disclosing any of their mysteries.

In the mean time Solymán the Magnificent, the most enlightened monarch of the Ottoman race, observing the power and the opulence of the Portuguese rising, and attributing it to its proper cause, and eager to supplant them, sent orders to the bashaw of Egypt to employ his whole strength against the Christians in the East Indies. The bashaw, in obedience to these orders, sailed out from the Red Sea with a greater naval force than ever the Mohammedans had employed before; having 4000 Janizaries, and 16,000 other land troops on board. Yet, by the courage and conduct of the Portuguese officers and soldiers, all this mighty armament was defeated, and their East India possessions saved from the danger which threatened them. In Africa likewise the king of Fez was baffled before the town of Safi, and fresh quarrels breaking out among the princes gave great relief to the Christians, who had long been obliged to carry on a defensive war,

and had more than once been on the very brink of ruin. For a long time indeed their safety had been derived only from the quarrels of the Moors among themselves; for such was the envy and jealousy which reigned among the Portuguese, that they could never unite heartily in opposing the common enemy; and therefore, had their enemies united against them, they must certainly have been cut off. But whenever the cheriffs quarrelled with each other, one party was sure to have recourse to the Portuguese; who, by sending them a small supply, secured quiet to themselves, and had the pleasure of seeing their enemies destroy one another. Yet in the end even this had bad consequences; for, on one hand, it kept up a martial spirit among the Moors, and on the other it made them acquainted with the Portuguese discipline; so that after every short interval of repose they not only found them as much enemies as before, but much more formidable than ever. The consequence of all this was, that King John began to apprehend that the conquest of Barbary was impossible, and therefore to limit his desires to the keeping of those few fortresses which he had already; which, though a necessary and prudent measure, displeased the generality of his subjects.

24
The state of
affairs in
Barbary.

King John exerted himself much in the settlement of Brazil in South America, which he brought into a very good state, caused several strong towns to be erected there, and took all possible methods to encourage the conversion of the natives to Christianity. He also made many regulations for the welfare and happiness of his subjects. The disputes of the nobility about precedence were frequently attended with very disagreeable consequences, which made the king resolve once for all to settle them by established rules; and the rules established by him on this occasion have subsisted ever since, and in a great measure prevent these altercations. He had other great designs in his mind, particularly with regard to the reformation, which he had pushed very far with respect to religious persons of both sexes; but, on a close examination of his affairs, he found his subjects in general to have been so much injured by his leaving their concerns to the inspection of his council, that he was thrown by the grief of it into a kind of apoplexy, from which he never recovered. His death happened in June 1557; and he was succeeded by his son Don Sebastian III. an infant of three years of age.

After the death of King John, the administration remained in the hands of the queen, grandmother to Sebastian, who behaved with great prudence and circumspection. The Moors, however, supposing that under a minority they might be able to dispossess the Christians of such places as they held in Barbary, laid close siege to Masagan. But the queen-regent sent such speedy succours, and promised such rewards to those who distinguished themselves, that the Moors, though they brought 80,000 men into the field, were obliged to abandon the enterprise. This was at first magnified as a high instance of the queen's capacity and wisdom; but in a short time the natural aversion which the Portuguese had to the government of women, together with the prejudice they had against her country, as being a Castilian, appeared so plainly, and gave her so much uneasiness, that of her own accord she resigned her authority into the hands of Cardinal Don Henry the

Portugal. the king's brother. By him Don Alexius de Meneses was appointed the king's governor, and Gonçales de Gomera with two other priests his preceptors. By means of those instructors the king's education was totally marred. His governor assiduously inculcated upon him that the chief virtue of a king was courage; that danger was never to be avoided, but always surmounted, let the occasion be what it would. His other tutors, instead of instructing him in the true religion, only inspired him with an abhorrence of professed infidels: the consequence of all which was, that he became rash, inconsiderate, and obstinate; all which qualities conspired to draw upon him the catastrophe which ruined both him and the kingdom.

25
Prepos-
tious edu-
cation of the
young king
Sebastian.

After the king was grown up to man's estate, his desire was to distinguish himself against the infidels. He himself chose an expedition to the East Indies; but the prime minister Alcoçova, who did not choose to attend his monarch to such a distance, substituted Africa in its stead. This expedition the king entered into in the most inconsiderate and absurd manner. He first sent over Don Antonio prior of Crato, with some hundreds of soldiers; carried his principal courtiers over with him from a hunting match, and without equipages; he then sent for the duke of Aveyro, with such troops as he could collect on the short warning he had got; and when all these were assembled, the king spent his time in hunting, and slight excursions against the enemy, without doing any thing of consequence, except exposing his person upon all occasions. At length he returned to Portugal in such tempestuous weather, that his subjects had given him up for lost; when they were agreeably surprised by his unexpected arrival in the river of Lisbon, which they celebrated with the greatest rejoicings.

26
He under-
takes an ex-
pedition
against A-
frica.

The little success which attended the king in this expedition served only to inflame him more with desire for another; so that from the time he returned, he seemed to think on nothing else. He was highly delighted also with an accident which at this time furnished him with a pretence for war, though of that he stood in no great need. Muley Hamet, king of Fez and Morocco, had been dispossessed of his dominions by his uncle Muley Moloch. At the beginning of this war Don Sebastian had offered him his troops in Africa, which offer was rejected with contempt: but now being a fugitive, and having in vain applied for assistance to Philip of Spain, Muley Hamet applied to the king of Portugal; and, that he might the more easily succeed, caused the fortrefs of Arzila, which his father had recovered, to be restored to the Portuguese. The king was in rapture at this event, and fancied that his glory would exceed that of all his predecessors. He was advised against this expedition, however, by all his friends. King Philip of Spain having done every thing to dissuade him from it in a personal conference, sent Francisco Aldana, an old and experienced officer, to Morocco; and at his return ordered him to attend Don Sebastian, in order to give him an account of the state of affairs in that country. This he performed with the greatest fidelity, but without any effect. The queen dowager and cardinal united in their endeavours to divert him from this unfortunate enterprise; but he treated them both with so little respect, that his grandmother broke her heart; and the cardinal, to show his dis-

taste to the measure, retired to Evora without coming either to court or council; which example was followed by many of the nobles. Many of these, however, sent very free remonstrances to the king on the impropriety of his conduct; and King Philip sent to him the duke de Medina Celi, once more to lay before him the reasons why he thought his scheme impracticable, and to put him in mind that he had no hand in pushing him upon his destruction, or of concealing from him the dangers into which he seemed determined to plunge himself and his subjects. Lastly, he received a letter on the subject from Muley Moloch himself, wherein that prince explained to him his own right to the crown of Fez, and showed that he had only dispossessed a tyrant and a murderer, who had therefore no right to his friendship or assistance. He next assured him that he had no reason to fear either the power or neighbourhood of the Portuguese; as a proof of which, and as a mark of his esteem, he was content to make him a present of ten miles of arable ground round each of the fortresses he possessed in Africa, and which indeed were no more than four, viz. Tangier, Ceuta, Mafagan, and Arzila. At the same time he addressed himself to King Philip of Spain, with whom he was on good terms, desiring him to interpose with his nephew Sebastian, that things might be yet adjusted without the effusion of human blood. But the king of Portugal was deaf to all salutary advice; and therefore paid no regard to this letter, nor to the remonstrances of his uncle. On the 24th of June 1577, therefore, he set sail from the bar of Lisbon with a fleet of 50 ships and five galleys, twelve pieces of cannon, and transports and tenders, making up near 1000 fail. His troops consisted of 9000 Portuguese foot; 3000 Germans; 700 Italians commanded by Sir Thomas Stukeley, an English exile, but remarkably brave; 2000 Castilians and 300 volunteers, commanded by Don Christopher de Tuvara master of the horse, a man of courage, but without either conduct or experience. He touched first at Lagos bay in the kingdom of Algarve, where he remained for four days: thence he proceeded to Cadiz; where he was magnificently feasted for a week by the duke de Medina Sidonia, who took the opportunity once more, by order of Philip, of dissuading him from proceeding further in person. But this exhortation proved as fruitless as the rest; and the king having sailed with a strong detachment for Tangier, ordered Don Diego de Souza, his commander in chief, to follow with the remaining part of the army.

The troops landed on the coast of Africa without any bad accident, and joined at Arzila. Here the king was met by the cheriff Muley Hamet, on whose account he had undertaken the war, who delivered him his son Muley, a boy of 12 years of age, as a hostage, and brought a reinforcement of 300 Moors. The boy was sent to Mafagon under a strong guard; but the father remained in the Portuguese camp. Here it was resolved in a council of war to reduce the town of Larache, but it was disputed whether the troops should proceed thither by land or sea. Don Sebastian, who espoused the former opinion, finding himself opposed by Muley Hamet, gave him such a rude answer, that he left his presence in discontent; after which the king's opinion prevailed, and the army began its march on the 29th of July. As they proceeded, the king received a

Move-
ments and
disposition
of the ar-
mies.

On the other hand Muley Moloch, having intelligence of this formidable invasion, took the field, though at that time so ill of a fever that he could not sit on horseback, with 40,000 foot and 60,000 horse. He conducted every thing, notwithstanding his distressed situation, with the greatest prudence. Finding some reason to suspect that part of his army were desirous of going over to his rival, he proclaimed that such as inclined to join their old master were at liberty to do it. This at once put a stop to the defection, and only a very few made use of the liberty which was granted them. Standing in doubt likewise of the fidelity of a body of 3000 horse, he sent them to reconnoitre the enemy, by which act of confidence he secured them. Still, however, he feared that his officers might be corrupted by the Portuguese gold; for which reason he changed the disposition of his army entirely, so that none of his officers commanded the corps to which they had been accustomed; and therefore, having new men to deal with, had none whom they could trust.

Having taken these precautions, he advanced against the Portuguese army with such celerity, that he came in sight of them on the 3d of August. On this Don Sebastian called a council of war; in which many who out of complaisance had given their opinions for this march, were now for returning. They were separated from the enemy by a river, and the Moors were masters of the ford, so that it was impossible to force them immediately in their posts; neither was it practicable for them to wait for a more favourable opportunity, because they had no provisions. The foreign officers, on the contrary were of opinion that fighting was now become necessary, and a retreat dangerous. This, however, was violently opposed by the cheriff, who saw plainly that they ran a great risk of being defeated and of losing all, while at the same time they were not certain of gaining any thing of consequence though they should be victorious: whereas, if they drew down towards the sea, they might entrench themselves till they were relieved by their fleet; during which interval if Muley Moloch should die, he looked upon it as certain that a great part of the army would desert to him, which would render him master not only of the kingdom, but of the fate of the Christians also. When he found that the king was bent on fighting, he only requested that the engagement might be delayed till 4 o'clock in the afternoon, that, in case of a defeat, they might have some chance of escaping: but even in this he could not prevail; for the king having disposed of every thing for a battle the next day, was impatient to begin the onset as soon as it was light.

In the mean time Muley Moloch was so sensible of the advantages of his situation, that he was inclined to take the whole Portuguese army prisoners; but finding his disease increase, so that he had no hopes of recovery, he came to the resolution to fight, that his antagonist might not avail himself of his death. The disposition of the Christian army was very regular and correct, through the care of some old officers in Don Sebastian's service: the infantry were disposed in three lines; the battalion of volunteers made the vanguard;

the Germans commanded by colonel Amberg, and the Italians by Sir Thomas Stuckeley, were on the right; the Castilian battalions on the left; the Portuguese in the centre and rear; the cavalry, consisting of about 1500 men, partly on the right under the command of the duke d'Avegro, to whom the cheriff joined himself with his horse: on the left was the royal standard, with the rest of the cavalry, under the command of the duke of Barcelos eldest son to the duke of Braganza, Don Antonio prior of Crato, and several other persons of great rank. The king took post at first with the volunteers. Muley Moloch disposed also his troops in three lines: the first consisted of the Andalusian Moors, commanded by three officers who had distinguished themselves in the wars of Granada; the second of renegadoes; and the third of the natives of Africa. They moved in a half moon, with 10,000 horse on each wing, and the rest in the rear, with orders to extend themselves in such a manner as to encompass the Christian army. Muley Moloch, though extremely weak, was taken out of his litter and set on horseback, that he might see how his commands had been obeyed; and being perfectly satisfied with the situation of his troops, he directed the signal of battle to be given. The Christians advanced with the greatest resolution; broke the first line of the Moorish infantry, and disordered the second. On this Muley Moloch drew his sword, and would have advanced to encourage his troops, but that his guards prevented him; on which his emotion of mind was so great, that he fell from his horse. One of his guards caught him in his arms, and conveyed him to his litter; where he immediately expired, having only time to lay his finger on his lips by way of enjoining them to conceal his death. But by this time the Moorish cavalry had wheeled quite round, and attacked the Christian army in the rear: upon which the cavalry in the left wing made such a vigorous effort that they broke the Portuguese or the right; and at this time the cheriff, in passing a rivulet, was drowned. In this emergency, the Germans, Italians, and Castilians, did wonders; but the Portuguese, according to their own historians, behaved indifferently. Attacked on all sides, however, they were unable to resist; and the whole army, except about 50 men, were killed or taken prisoners. The fate of the king is variously related. According to some, he had two horses killed under him, and then mounted a third. His bravest officers were killed in his defence; after which the Moors surrounded him, seized his person, stripped him of his sword and arms, and secured him. They immediately began to quarrel about whose prisoner he was; upon which one of the generals rode in among them, crying, "What, you dogs, when God has given you so glorious a victory, would you cut one another's throats about a prisoner?" at the same time discharging a blow at Sebastian, he brought him to the ground, when the rest of the Moors soon dispatched him. Others affirm, that one Lewis de Brito meeting the king with his standard wrapped round him, Sebastian cried out, "Hold it fast, let us die upon it!" upon which charging the Moors, he was seized, rescued by Brito, who was himself taken with the standard, and carried to Fez. He affirmed, that after he was taken, he saw the king at a distance, and unpursued. Don Lewis de Lima met him afterwards making

Portugal. making towards the river ; and this is the last account we have of his being seen alive.

Muley Hamet, the brother of Muley Moloch, was proclaimed king by the Moors immediately after the battle. Next day, having ordered all the prisoners to be brought before him, the new sovereign gave orders to search for the body of Don Sebastian. The king's valet-de-chambre brought back a body, which he said was that of his master, but so disfigured with wounds, that it could not well be known ; so that notwithstanding the most diligent search, this monarch's death could never be properly authenticated. This body, however, was preserved by Muley Hamet, who delivered it up as the body of Don Sebastian to King Philip of Spain. By him it was sent to Ceuta, from whence it was transported to Portugal, and buried among his ancestors in the monastery at Belem, with all possible solemnity.

By this terrible disaster, the kingdom of Portugal, from being the most eminent, sunk at once into the lowest rank of the European states. All the young nobility were cut off, or carried into slavery : the kingdom was exhausted of men, money, and reputation ; so that Don Henry, who assumed the government after the death of his brother Don Sebastian, found himself in a very disagreeable situation. The transactions of his reign were quite trifling and unimportant ; but after his death a great revolution took place. The crown of Portugal was claimed by three different competitors ; viz. the prince of Parma, the dukes of Braganza, and Philip of Spain. Whatever might have been the merits of their respective claims, the power of Philip quickly decided the contest in his favour. He found his schemes facilitated by the treachery of the regents, who took the most scandalous methods of putting the kingdom into his hands. Under pretence of inspecting the magazines, they took out some of the powder, and mixed the rest with sand : they appointed an agent to go to France for succours, from whence they knew that they could not arrive in time ; they dissolved the states as soon as they discovered that they were bent on maintaining the freedom of the nation ; and, under a show of confidence, sent off to distant places such of the nobility as they suspected.

King Philip, finding every thing in his favour, commanded the duke of Alva to invade Portugal, at the head of 20,000 men. The people, perceiving that they were betrayed, exclaimed against the governors, and placed on the throne Don Antonio prior of Crato. But his forces being inexperienced, and he himself behaving in a very improper manner, he was quickly defeated by the duke of Alva, and forced to fly out of the kingdom, which he effected with great difficulty. On his flight the whole kingdom submitted, together with the garrisons in Barbary, the settlements on the western coast of Africa, of Brazil, and in the East Indies. All the Madeiras, however, except the isle of St Michael, held out for Don Antonio until they were reduced, and the French navy, who came to their assistance, entirely defeated and destroyed.

Philip made his entry into Lisbon as soon as the kingdom was totally reduced, and endeavoured to conciliate the affections of the people by confirming the terms which he had before offered to the states. These terms were, that he would take a solemn oath to main-

tain the privileges and liberties of the people : that the states should be assembled within the realm, and nothing proposed in any other states that related to Portugal : that the viceroy or chief governor should be a native, unless the king should give that charge to one of the royal family : that the household should be kept on the same footing : that the post of first president, and of all offices, civil, military, and judicial, should be filled with Portuguese ; all dignities in the church and in the orders of knighthood confined to the same ; the commerce of Ethiopia, Africa, and the Indies, reserved also to them, and to be carried on only by their merchants and vessels : that he would remit all imposts on ecclesiastical revenues : that he would make no grant of any city, town, or jurisdiction royal, to any but Portuguese : that estates resulting from forfeitures should not be united to the domain, but go to the relations of the last possessor, or be given to other Portuguese for recompense of services : that when the king came to Portugal, where he should reside as much as possible, he should not take the houses of private persons for his officers' lodging, but keep to the custom of Portugal : that wherever his majesty resided, he should have an ecclesiastic, a treasurer, a chancellor, two masters of requests, with under officers, all of them Portuguese, who should dispatch every thing relating to the kingdom : that Portugal should ever continue a distinct kingdom, and its revenue be consumed within itself : that all matters of justice should be decided within the realm : that the Portuguese should be admitted to charges in the households of the king and queen of Spain : that all duties on the frontiers should be taken away : and, lastly, that Philip should give 300,000 ducats to redeem prisoners, repair cities, and relieve the miseries which the plague and other calamities had brought upon the people. All these conditions, formerly offered and rejected by the Portuguese, the king now confirmed : but whereas the duke of Ossuna, by way of security for these conditions, had promised them a law, that if the king did not adhere to them, the states should be freed from their obedience, and might defend their right by the sword, without incurring the reproach of perjury, or the guilt of treason ; this he absolutely refused to ratify.

All these concessions, however, did not answer the purpose ; nay, though Philip was to the last degree lavish of honours and employments, the Portuguese were still dissatisfied. This had also an effect which was not foreseen : it weakened the power, and absorbed the revenues, of the crown ; and, by putting it out of the power of any of his successors to be liberal in the same proportion, it raised only a short-lived gratitude in a few, and left a number of malecontents, to which time was continually adding.

Thus Philip, with all his policy, and endeavours to please, found his new subjects still more and more disgusted with his government, especially when they found their king treating with the utmost severity all those who had supported Don Antonio. The exiled prince, however, still styled himself *king of Portugal*. At first he retired to France, and there demanded succours for the recovery of his dominions. Here he found so much countenance, that with a fleet of near 60 sail, and a good body of troops on board, he made an attempt upon the Terceras, where his fleet was beat by the Spaniards ; and a great number of prisoners being taken,

ken,

Portugal. ken, all the officers and gentlemen were beheaded, and a great number of meaner people hanged. Don Antonio, notwithstanding, kept possession of some places, coined money, and performed many other acts of regal power; but was at length constrained to retire, and it was with some difficulty that he did so, and returned into France. He passed from thence into England, where he was well received; and many fitted out privateers to cruise against the Spaniards under his commission. But after king Philip had ruined the naval power of Portugal as well as Spain, by equipping the armada, Queen Elizabeth made no difficulty of owning and assisting Don Antonio, and even of sending Sir John Norris and Sir Francis Drake with a strong fleet and a great army to restore him. Upon this occasion Don Antonio sent his son Don Christopher a hostage to Muley Hamet king of Fez and Morocco, who was to lend him 200,000 ducats. But king Philip prevented this by surrendering Arzila: and this disappointment, the unseasonable enterprise upon Corunna, and the disputes that arose between Norris and Drake, rendered that expedition abortive; so that, except carrying the plague into England, it was attended with no consequences worthy of notice. He remained some time after in England: but finding himself little regarded, he withdrew once more into France, where he fell into great poverty and distress; and at length dying in the 64th year of his age, his body was buried in the church of the nuns of Ave Maria, with an inscription on his tomb, in which he is styled *king*. He left several children behind him, who, on account of his being a knight of Malta, and having made a vow of virginity at his entrance into the order, were looked upon as illegitimate. He preserved, even to the day of his death, a great interest in Portugal; and had drawn from thence, in the course of his life, immense sums of money; which had been squandered in many fruitless negotiations and attempts to disturb the possessions of king Philip in almost all parts of his dominions, and particularly in the Indies, where the Portuguese were rather more averse to the Castilian yoke, or at least testified their aversion more openly, than in Europe.

34
Impostors
pretending
to be Don
Sebastian.

But Don Antonio was not the only pretender to the crown of Portugal: for the people, partly through the love of their prince, and partly from their hatred to the Castilians, were continually feeding themselves with the hopes that Don Sebastian would appear and deliver them; and in this respect such a spirit of credulity reigned, that it was said proverbially, they would have taken a negro for Don Sebastian. This humour put the son of a tiler at Alcobaza, who had led a profligate life, and at length turned hermit, to give himself out for that prince; and having with him two companions, one of them styled himself *Don Christopher de Tavora*, and the other the *bishop of Guarda*, they began to collect money, and were in a fair way of creating much disturbance, if the cardinal arch-duke had not caused him to be apprehended; and after leading him ignominiously through the streets of Lisbon, he who took the name of *Sebastian* was sent to the galleys for life, and the pretended bishop was hanged. Not long after, Gonfalo Alvarez, the son of a mason, gave himself out for the same king; and having promised marriage to the daughter of Pedro Alonso, a rich yeoman, whom he created Earl of Torres Novas, he assembled a

body of about 800 men, and some blood was spilt before he was apprehended: at length, being clearly proved to be an impostor, himself and his intended father-in-law were publicly hanged and quartered at Lisbon; which, instead of extinguishing this humour, farther increased it.

There was, however, a person who appeared about 20 years after the fatal defeat of Sebastian, at Venice, who created much more trouble. He assumed the name of *Don Sebastian*, and gave a very distinct account of the manner in which he had passed his time from that defeat. He affirmed, that he had preserved his life and liberty by hiding himself amongst the slain: that, after wandering in disguise for some time in Africa, he returned with two of his friends into the kingdom of Algarve: that he gave notice of this to the king Don Henry: that finding his life sought, and being unwilling to disturb the peace of the kingdom, he returned again among the Moors, and passed freely from one place to another in Barbary, in the habit of a penitent: that after this he became a hermit in Sicily; but at length resolved to go to Rome, and discover himself to the pope. On the road he was robbed by his domestics, and came almost naked to Venice, where he was known, and acknowledged by some Portuguese. Complaint being made to the senate, he was obliged to retire to Padua. But the governor of that city ordering him also to depart, he, not knowing what to do, returned again to Venice; where, at the request of the Spanish ambassador, who charged him not only with being an impostor, but also with many black and atrocious crimes, he was seized, and thrown into prison. He underwent 28 examinations before a committee of noble and impartial persons; in which he not only acquitted himself clearly of all the crimes that had been laid to his charge, but entered also into so minute a detail of the transactions that had passed between himself and the republic, that the commissioners were perfectly astonished, and showed no disposition to declare him an impostor; moved more especially by the firmness of his behaviour, his singular modesty, the sobriety of his life, his exemplary piety, and his admirable patience under his afflictions. The noise of this was diffused throughout Europe, and the enemies of Spain endeavoured every where to give it credit.

Portugal.

35
Account of
a remarkable
one.

The state, however, refused to discuss the great point, whether he was or was not an impostor, unless they were requested so to do by some prince or state in alliance with them. Upon this the prince of Orange sent Don Christopher, the son of the late Don Antonio, to make that demand; and at his request an examination was made with great solemnity: but no decision followed; only the senate set him at liberty, and ordered him to depart their dominions in three days. He went therefore, by the advice of his friends, to Padua, but in the disguise of a monk, and from thence to Florence; where he was arrested by the command of the grand duke, who delivered him to the viceroy of Naples. The count de Lemos, then in possession of that dignity, died soon after; before whom he was first brought; this man asserted, he must know him to be Don Sebastian, since he had been twice sent to him from the king of Spain. He remained prisoner several years in the castle Del Ovo, where he endured incredible hardships. At length he was brought out, led with infamy through the streets

of

Portugal.

of the city, and declared to be an impostor, who assumed the name of *Sebastian*: at which words, when proclaimed before him, he said gravely, *And so I am*. In the same proclamation it was affirmed, that he was in truth a Calabrian; which as soon as he heard, he said, *It is false*. He was next shipped on board a galley as a slave; then carried to St. Lucar, where he was some time confined; from thence he was transferred to a castle in the heart of Castile, and never heard of more. Some persons were executed at Lisbon for their endeavours to raise an insurrection on his behalf: but it was thought strange policy, or rather a strange want of policy, in the Spaniards, to make this affair so public without proofs; and the attempt to silence this objection, by affirming him to be a magician, was justly looked upon as ridiculous.

36
Bad consequences of the Spanish administration.

The administration of affairs in Portugal, during the reign of Philip, was certainly detrimental to the nation; and yet it does not appear that this flowed so much from any ill intention in that monarch, as from errors in judgment. His prodigious preparations for the invasion of England impoverished all his European dominions; but it absolutely exhausted Portugal. The pretensions of Don Antonio, and the hopes of despoiling their Indian fleets, exposed the Portuguese to the resentment of the English; from which the king having granted away all his domains, wanted power to defend them. Their clamours were not at all the less loud for their being in some measure without cause. The king, to pacify them, borrowed money from the nobility upon the customs, which were the only sure remedy he had still left; and this was attended with fatal consequences. The branches, thus mortgaged, became, and continue to this hour, fixed and hereditary; so that the merchant was oppressed, and the king received nothing. This expedient failing, a tax of three *per cent.* was imposed, in the nature of ship-money, for the defence of the coasts and the commerce, which for some years was properly applied; but it then became a part of the ordinary revenue, and went into the king's exchequer without account. This made way for diverting other appropriated branches; as for instance, that for the repair of fortifications, the money being strictly levied, and the works suffered to decay and tumble down; and for the maintenance of the conquest in Africa, by which the garrisons mouldered away, and the places were lost. Upon the whole, in the space of 18 years, the nation was visibly impoverished: and yet the government of Philip was incomparably better than that of his successors; so that his death was justly regretted; and the Portuguese were taught by experience to confess, that of bad masters he was the best.

His son Philip, the second of Portugal and the third of Spain, sat 20 years upon the throne before he made a visit to Portugal, where the people put themselves to a most enormous expence to receive him; for which they received little more than the compliment, that before his entry into Lisbon, he knew not how great a king he was. He held an assembly of the states, in which his son was sworn successor. Having done all that he wanted for himself, he acquired a false idea of the riches of the nation from an immoderate and foolish display of them during his short stay at Lisbon; and having shown himself little, and done less, he returned into Spain; where he acted the part of a good king

Vol. XV.

upon his death bed, in deploring bitterly that he never thought of acting it before. The reign of Philip III. and IV. was a series of worse measures, and worse fortune: all his dominions suffered greatly; Portugal most of all. The loss of Ormus in the East, of Brazil in the West Indies, together with the shipwreck of a fleet sent to escort that from Goa, brought the nation incredibly low, and encouraged the conde duke to hope they might be entirely crushed. These are the heads only of the transactions for 40 years: to enter in any degree into the particulars, is, in other words, to point out the breaches made by the Spanish ministers on the conditions granted by king Philip; which, with respect to them, was the original contract, and unalterable constitution of Portugal while subject to the monarchs of Castile; and which, notwithstanding, they so often and so flagrantly violated, that one would have imagined they had studied to provoke the wrath of heaven, and insult the patience of men, instead of availing themselves, as they might have done, of the riches, power, and martial spirit of the Portuguese people.

It was the very basis and foundation of their privileges, that the kingdom should remain separate and independent, and consequently that Lisbon should continue as much its capital as ever, the several supreme councils and courts residing; so that the natives of this realm might not be obliged to travel in search of justice. So little, or at least so short a time, was this observed, that neither promotion nor justice was to be obtained without journeys, and Madrid was not more the capital of Castile than of Portugal. The general assembly of estates was to be held frequently, and they were held thrice in the space of 60 years; and of these twice within the first three. The king was to reside in this realm, as often and as long as possible; in compliance with which, Philip I. was there but once, Philip II. but four months, and Philip III. was never there at all. The household establishment was suppressed through all their reigns. The viceroy was to be a native of Portugal, or a prince or princess of the blood; yet when any of the royal family bore the title, the power was in reality in the hands of a Spaniard. Thus, when the princess of Mantua was vice-queen, the marquis de la Puebla was to assist in council, and in all dispatches; and she was to do nothing without his advice. The council of Portugal, which was to be composed entirely of natives, was filled with Castilians, as the garrisons also were, though the contrary had been promised. The presidents of provinces, or corregidores, were to be natives; but by keeping those offices in his own hands, the king eluded this article. No city, town, or district, was to be given but to Portuguese: yet the duke of Lerma had Beja, Serpa, and other parts of the demesnes of the crown, which were formerly appendages of the princes of the blood. None but natives were capable of offices of justice, in the revenue, in the fleet, or of any post civil or military; yet these were given promiscuously to foreigners, or sold to the highest bidder; not excepting the governments of castles, cities, and provinces. The natives were so far from having an equal chance in such cases, that no posts in the presidials were ever given to them, and scarce any in garrisons; and whenever it happened, in the case of a person of extraordinary merit, whose pretensions could not be rejected, he was either removed, or not allowed to exercise his charge;

Portugal.
37
Great losses in Asia and America.

The Portuguese oppressed by the Spaniards.

Portugal. as fell out to the marquis of Marialva and others. The forms of proceeding, the jurisdiction, the ministers, the secretaries, were all changed, in the council of Portugal; being reduced from five to three, then two, and at last to a single person.

39
A revolution in favour of the duke of Braganza.

By reason of these and many other grievances too tedious to be mentioned here, the detestation of the Spanish government became universal; and in 1640 a revolution took place, in which John duke of Braganza was declared king, by the title of John IV. This revolution, as being determined by the almost unanimous voice of the nation, was attended with very little effusion of blood; neither were all the efforts of the king of Spain able to regain his authority. Several attempts indeed were made for this purpose. The first battle was fought in the year 1644, between a Portuguese army of 6000 foot and 1100 horse, and a Spanish army of nearly the same number. The latter were entirely defeated; which contributed greatly to establish the affairs of Portugal on a firm basis. The king carried on a defensive war during the remainder of his life; but after his death, which happened in 1655, the war was renewed with great vigour.

This was what the Spaniards did not expect; for they expressed a very indecent kind of joy at his death, hoping that it would be followed by a dissolution of the government. It is not indeed easy to conceive a kingdom left in more perilous circumstances than Portugal was at this time:—The king Don Alonzo Enriquez, a child not more than 13 years of age, reputed of no very sound constitution either in body or mind; the regency in a woman, and that woman a Castilian; the nation involved in a war, and this respecting the title to the crown; the nobility, some of them secretly disaffected to the reigning family, and almost all of them embarked in feuds and contentions with each other; so that the queen scarce knew who to trust or how she should be obeyed. She acted, however, with great vigour and prudence. By marrying her only daughter the princess Catharine to Charles II. King of Great Britain, she procured to Portugal the protection of the English fleets, with reinforcements of some thousands of horse and foot; and at last, in 1665, terminated the war by the glorious victory of Montefclaros. This decisive action broke the power of the Spaniards, and fixed the fate of the kingdom, though not of the king, of Portugal. Alonzo was a prince whose education had been neglected in his youth, who was devoted to vulgar amusements and mean company, and whom the queen for these reasons wished to deprive of the crown, that she might place it on the head of his younger brother Don Pedro. To accomplish this purpose, she attempted every method of stern authority and secret artifice; but she attempted them all in vain. The Portuguese would not consent to set aside the rights of primogeniture, and involve the kingdom in all the miseries attending a disputed succession. After the death, however, of the queen-mother, the infant entered into cabals against the king of a much more dangerous nature than any that she had carried on. Alonzo had married the princess of Nemours; but being, as was said, impotent, and likewise less handsome than his brother, that lady transferred her affection to Don Pedro, to whom she lent her assistance to hurl the king from the throne. Alonzo was compelled to sign a resigna-

41
Don Alonzo obliged to resign the throne.

tion of the kingdom; and his brother, after governing a few months without any legal authority, was in a meeting of the states unanimously proclaimed regent, and vested with all the powers of royalty. Soon after this revolution, for such it may be called, the marriage of the king and queen was declared null by the chapter of Lisbon; and the regent, by a papal dispensation, and with the consent of the states, immediately espoused the lady who had been wife to his brother. He governed, under the appellation of *regent*, 15 years, when, upon the death of the king, he mounted the throne by the title of Don Pedro II. and after a long reign, during which he conducted the affairs of the kingdom with great prudence and vigour, he died on the 19th of December 1706.

Don John V. succeeded his father; and though he was then little more than 17 years of age, he acted with such wisdom and resolution, adhered so steadily to the grand alliance formed against France and Spain, and showed such resources in his own mind, that though he suffered great losses during the war, he obtained such terms of peace at Utrecht, that Portugal was in all respects a gainer by the treaty. The two crowns of Spain and Portugal were not, however, reconciled thoroughly till the year 1737; and from this period they became every day more united, which gave much satisfaction to some courts, and no umbrage to any. In this situation of things, a treaty was made in 1750 with the court of Madrid, by which Nova Colonia, on the river of Plata, was yielded to his Catholic majesty, to the great regret of the Portuguese, as well on account of the value of that settlement, as because they apprehended their possession of the Brasils would by this action be rendered precarious. On the last of July the same year, this monarch, worn out by infirmities, deceased, in the 61st year of his age, and in the 44th of his reign.

Don Joseph, prince of Brasil, succeeded him, to the universal satisfaction of his subjects, and with as great expectations as ever any monarch that mounted the throne. It was generally believed that he would make considerable alterations, in which he did not disappoint the hopes of the public; and yet they were done so slowly, with such moderation, and with so many circumstances of prudence, as hindered all grounds of complaint. Amongst other new regulations, the power of the inquisition suffered some restriction; the king directing, that none of their sentences should be put in execution till reviewed and approved by his privy-council. But as in the reign of his father he had consented to the treaty with Spain, he ratified it after his accession, and since carried it into execution upon this noble principle, that no considerations of interest ought ever to induce a monarch to break his word.

However, within the space of the few years of this king's reign, the calamities of Portugal in general, and those of the city of Lisbon in particular, cannot, in a great degree, be paralleled in all history. An earthquake, a fire, a famine, an assassination-plot against their prince, executions upon executions, the scaffolds and wheels for torture reeking with the noblest blood; imprisonment after imprisonment of the greatest and most distinguished personages; the expulsion of a chief order of ecclesiastics; the invasion of their kingdom by a powerful, stronger, and exasperated nation; the numerous

Portugal.

rous troops of the enemy laying waste their territory, bringing fire and sword with them, and rolling like distant thunder towards the gates of their capital; their prince ready almost to save himself by flight! The Spanish ministry had already decreed the doom of Portugal, and nothing was to be heard at the Escorial but *Delenda est Carthago*. Carthaginian, perhaps, or Jewish story, may possibly afford a scene something like this, but for the shortness of the period not to big with events, though in their final destruction superior. From that indeed, under the hand of Providence, the national humanity and generosity of Great Britain has preserved the Portuguese; and it remains now to be seen, in future treaties, how that people will express their gratitude (see BRITAIN, n° 450). Those who are able to search deeper into human affairs, may assign the causes of such a wonderful chain of events; but no wise man will ascribe all this to so singular a cause as that which a Spaniard has done, in a famous pamphlet, printed in the year 1762 at Madrid. It is intitled, *A Spanish Prophecy*; and endeavours to show, that all these calamities have befallen the Portuguese, solely on account of their connection with the heretic English. The great Ruler and Governor of the world undoubtedly acts by universal laws, regarding the whole system, and cannot, without blasphemy, be considered in the light of a partizan. The rest of the pamphlet tends to show, that his Catholic majesty carried his arms into Portugal, solely to give them liberty, and set them free from English tyranny.

Joseph dying without male issue, the succession devolved to Mary, his daughter, now queen of Portugal. She was married some time before he died, with the pope's dispensation, to his brother Don Pedro.

The air of Portugal, in the southern provinces, would be excessively hot, if it were not refreshed by the sea-breezes; but in the northern, it is much cooler, and the weather more subject to rains. The spring is extremely delightful here; and the air, in general, more temperate than in Spain. Lisbon has been much resorted to of late by valetudinarians and consumptive persons from Great Britain, on account of its air. The soil is very fruitful in wine, oil, lemons, oranges, pomegranates, figs, raisins, almonds, chestnuts, and other fine fruits; but there is a want of corn, owing, it is said, in a great measure to the neglect of agriculture. There is plenty of excellent honey here; and also of sea and river fish, and sea-salt. The horses in Portugal are briskly animals, as they are in Spain, but of a slight make: but mules being sturdier-footed, are more used for carriage and draught. By reason of the scarcity of pasture, there are not many herds of cattle or flocks of sheep; and what they have are small and lean, though the flesh is tolerably good: their best meat is said to be that of hogs and kids. The country in many parts is mountainous: but the mountains contain all kinds of ores; particularly of silver, copper, tin, and iron, with a variety of gems, beautifully variegated marble, mill-stones, and many curious fossils. Not far from Lisbon is a mine of saltpetre; but none of the metal mines are here worked, the inhabitants being supplied with metals of all kinds from their foreign settlements. The principal rivers are the Minho, in Latin *Minius*; the Lúnia, anciently the famed Lethe; the Cavado; the Douro; the Guadiana, anciently Anas; and the Tajo,

or Tagus, which is the largest river in the kingdom, carrying some gold in its sands, and falling into the sea a little below Lisbon. There are several mineral springs in the kingdom, both hot and cold, which are much frequented.

The only religion tolerated in Portugal is that of the church of Rome; yet there are many concealed Jews, and those too even among the nobility, bishops, prebends, monks, and nuns, and the very inquisitors themselves. If a Jew pretends to be a Christian and a Roman Catholic, while he is really a Jew, by going to mass, confession, &c. or if after being converted, or pretending to be converted and pardoned, he relapses into Judaism and is discovered, the inquisition lays hold of him. In the first case, if he renounce Judaism, he is only condemned to some corporal punishment or public shame, and then ordered to be instructed in the Christian religion. In the second, he is condemned to the flames without mercy. Besides Jews and heretics, who broach or maintain any doctrines contrary to the religion of the country, the inquisition punishes all sodomites, pretenders to sorcery and the black art, apostates, blasphemers, perjured persons, imposters, and hypocrites. The burning of those condemned by the inquisition, is called an *auto da fe*, or "act of faith." There are several tribunals of the inquisition, one of which is at Goa in the East Indies; but there are none in Brasil. The number of convents in Portugal is said to be 900. The order of Jesuits hath been suppressed in this country, as they have been in others. Here is a patriarch, several archbishops and bishops: the patriarch is always a cardinal, and of the royal family. The archbishops rank with marquises, and the bishops with counts. The Portuguese have archbishops and bishops in the other quarters of the world as well as in Europe. The sums raised by the popes here, by virtue of their prerogatives, are thought to exceed the revenues of the crown, and the nuncios never fail of acquiring vast fortunes in a short time. Though there are two universities and several academies, yet while the papal power, and that of the ecclesiastics, continues at such a height, true learning is like to make but a small progress. The language of the Portuguese does not differ much from that of Spain: Latin is the groundwork of both; but the former is more remote from it, and harsher to the ear than the latter. The Portuguese tongue is spoken on all the coast of Africa and Asia as far as China, but mixed with the languages of the several nations in those distant regions.

With regard to manufactures, there are very few in Portugal, and those chiefly coarse silks, woollen cloths, and some linen; but their foreign trade is very considerable, especially with England, which takes a great deal of their wine, salt, foreign commodities, and fruits, in return for its woollen manufactures, with which the Portuguese furnish their colonies and subjects in Asia, Africa and America. Their plantations in Brasil are very valuable, yielding gold, diamonds, indigo, copper, tobacco, sugar, ginger, cotton, hides, gums, drugs, dyeing woods, &c. From their plantations in Africa, they bring gold and ivory, and slaves to cultivate their sugar and tobacco plantations in Brasil. They have still several settlements in the East Indies, but far less considerable than formerly. The Azores or Western Isles, Madeira, and the Cape de Verde islands, also belong to them;

Religion.

48
Manufactures.

Portugal. them; but a great part of the riches and merchandize brought from these distant countries becomes the property of foreigners, for the goods they furnish the Portuguese with to carry thither. The king's fifth of the gold brought from Brasil amounts commonly to about 300,000 l. Sterling; so that the whole annual produce of gold in Brasil may be estimated at near 2,000,000 Sterling. Lisbon is the greatest port in Europe next to London and Amsterdam.

49
Constitution and government.

As to the constitution of Portugal, it is an absolute hereditary monarchy. Both here and in Spain there were anciently cortes, states, or parliaments; but they have long since entirely lost their share in the legislature. For the administration of the civil government, there is a council of state, and several secretaries; for military affairs, a council of war; for the finances, a treasury-court; and for the distribution of justice several high tribunals, with others subordinate to them, in the several districts into which the kingdom is divided. The cities have their particular magistracy. The proceedings of the courts are regulated by the Roman law, the royal edicts, the canon law, and the pope's mandates. Like the Spaniards, they transact most of their business in the mornings and evenings, and sleep at noon. The nobility are very numerous, and many of them are descended from natural sons of the royal family. They are divided into high and low. The high consists of the dukes, marquises, counts, viscounts, and barons, who are also grandees, but of different classes, being suffered to be covered in the king's presence, and having the title of *Dons*, with a pension from the royal treasury, to enable them the better to support their dignity: the king styles them *Illustrious* in his letters, and treats them as princes. A duke's sons are also grandees, and his daughters rank as marchionesses. The inferior nobility or gentry are termed *Hidalgos*, i. e. gentlemen: they cannot assume the title of *Don* without the king's licence.

50
Revenues of the king.

The revenues of the crown, since the discovery of the Brasil mines, are very considerable; but the real amount can only be guessed at. Some have said that it amounts, clear of all salaries and pensions, to upwards of 3,000,000 Sterling; others make it a great deal less. Thus much is certain, that the customs and other taxes run excessively high. Besides the royal demesnes, the hereditary estates of the house of Braganza, the monopoly of Brasil snuff, the coinage, the money arising from the sale of indulgences granted by the pope, the fifth of the gold brought from Brasil, the farm of the Brasil diamonds, the masterships of the orders of knighthood, and other sources, yield very large sums. The forces, notwithstanding, of this nation, both by sea and land, are very inconsiderable; their land-forces being the worst militia in Europe, and their navy of little importance. They would be an easy conquest to the Spaniards if they were not under the protection of Britain.

51
Knighthood.

There are several orders of knighthood here, viz. the order of Christ, the badge of which is a red cross within a white one, and the number of the commanderies 454. 2. The order of St James, the badge of which is a red sword in the shape of a cross. A great number of towns and commanderies belong to this order. 3. The order of Aviz, whose badge is a green cross in form of a lily, and the number of its commanderies 49.

Though these three orders are religious, yet the knights are at liberty to marry. 4. The order of St John, which has also several commanderies.

Portugal
||
Portulacas

The king's titles are, *King of Portugal and the Algarves, on this side and the other side the sea of Africa; Lord of Guinea, and of the navigation, conquests, and commerce, in Ethiopia, Arabia, Persia India, &c.* The king's eldest son is styled *Prince of Brasil*. In the year 1749, pope Benedict XIV. dignified the king with the title of *His most faithful majesty*.

52
Character of the Portuguese people.

The Portuguese are represented as inferior to the Spaniards both in person and genius; as extremely haughty, treacherous, and crafty in their dealings; much given to avarice and usury; and vindictive, malicious, and cruel. The meaner sort are said to be extremely addicted to thieving; notwithstanding, it must be owned, that they have shown themselves on many occasions a brave and warlike people. They are justly famed for their skill in navigation; and for the many discoveries they have made, both in the East and West Indies. The women here, and in other countries of the same degree of heat, are not so prolific as in the colder climates; but they are said to be very beautiful whilst young, though their complexion is somewhat upon the olive. Their eyes are very black and sparkling, and retain their brilliancy after all their other charms are gone. It is the fashion here, at present, as in most other countries, for the ladies to spoil and disfigure their skins and complexions with paints and washes: but, though lively and witty, they are said to have a nice sense of female honour. Both men and women make great use of spectacles; often not so much to aid their sight, as to denote their wisdom and gravity. Their dress, like that of the Spaniards, never used to vary, especially among the men; but of late years, both men and women have given much into the French modes. The women, when they go abroad on foot, are wont to use long veils, which cover their heads, but leave their faces bare.

PORTUGALLICA TERRA, earth of Portugal; the name of a fine astringent bole, dug in great plenty in the northern part of Portugal.

PORTULACA, PURSLANE: A genus of the monogynia order, belonging to the dodecandria class of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The corolla is pentapetalous; the calyx bifid; the capsule unilocular, and cut round. There are several species, but the two following are the most remarkable. 1. The oleracea, annual, or common culinary purslane, rises with herbaceous, low, succulent, branchy stalks, six or eight inches high, garnished with wedge-shaped, thick, succulent leaves, and small close-setting flowers. There are two varieties; one with deep green leaves, the other with yellow leaves; both of which rise from the same seed. 2. The anacamperos, perennial, or shrubby cape purslane, rises with a shrubby branchy stalk, about six inches high, with oval, gibbous, succulent leaves, and the stalks terminated by small clusters of red flowers. Both these plants are of a succulent nature: the first is an herbaceous annual, for culinary uses; and the second a shrubby perennial, raised by the curious for variety. They are both exotics of a tender quality, of the temperature of greenhouse or stove plants. The common culinary purslane is raised annually from seed for summer use, and is an excellent ingredient.

Portumna
||
Pospolite.

gradient in summer salads, but improper for winter on account of its cold moist nature. The plant being tender, must be raised either on a hot-bed or in a warm border; in which last it will not succeed before April or May. The shrubby fort must be kept in the hot-house, in pots of a dry soil.

PORTUMNA, a town of Ireland, in the county of Galway and province of Connaught, is 74 miles from Dublin. The castle of Portumna, the seat of the Earl of Clanricarde, is at this place, and near it are the ruins of an ancient castle. There is also a garrison for a troop of horse and two companies of foot. The town is seated on the river Shannon, where it falls into Lough Dreg. The monks of the Cistercian abbey of Dunbrody, in the county of Wexford, had for a long time a chapel here, dedicated to St Peter and St Paul; but having at length forsaken it, O'Madden, dynast of the country, gave it to the Dominican friars, who, with the approbation of the monks of Dunbrody, erected a friary here and a church, which they dedicated to the blessed Virgin and the original patron saints; at the same time they built a steeple, and all other necessary offices. Pope Martin V. granted a bull to confirm their possessions, dated the 8th October 1426; and on the 23^d of November following he granted indulgencies to all who had contributed to the building. The walls are still nearly entire, and show that the monastery of Portumna was by no means an ignoble structure. The ancient choir is now the parish church.

POSE, in heraldry, denotes a lion, horse, or other beast, standing still, with all his four feet on the ground. See Hellinghead's *Description of Britain*, chap. xvi.

POSITIVE, a term of relation opposed to negative. It is also used in opposition to relative or arbitrary: thus we say, Beauty is no positive thing, but depends on the different tastes of people.

POSITIVE Degree, in grammar, is the adjective in its simple signification, without any comparison.

POSITIVE Electricity. In the Franklinian system all bodies supposed to contain more than their natural quantity of electric matter are said to be *positively* electrified; and those from whom some part of the electricity is supposed to be taken away are said to be electrified *negatively*. These two electricities being first produced, one from glass, the other from amber or rosin, the former was called *vitreous*, the other *resinous*, electricity.

POSPOLITE, in the military establishment of Poland, is the name given to a kind of militia. It is the most numerous and the most usefless of the Polish armies. It consists of the gentry at large, who, in case of invasion, are assembled by a regular summons from the king, with consent of the diet. Every palatinate is divided into districts, over each of which proper officers are appointed; and every person possessing free and noble tenures is bound to military service, either singly or at the head of a certain number of his retainers, according to the extent and nature of his possessions. The troops thus assembled are obliged only to serve for a limited time, and are not under the necessity of marching beyond the limits of their country. They submit to no discipline but such as they like themselves; and are very apt to mutiny if detained more than a fortnight in the place appointed them to meet in, without march-

ing. The mode of levying and maintaining this army is exactly similar to that practised under the feudal system. At present, though it is almost totally unfit for the purposes of repelling a foreign enemy, it is yet a powerful instrument in the hands of domestic faction: for the expedition with which it is raised under the feudal regulations facilitates the formation of those dangerous confederacies which suddenly start up on the contested election of a sovereign, or whenever, the nobles are at variance with each other.

POSSE COMITATUS, in English law, signifies the power of the county, or the aid and assistance of all the knights, gentlemen, yeomen, labourers, servants, apprentices, &c. and all others within the county that are above the age of 15, except women, ecclesiastical persons, and such as are decrepit and infirm.

This posse comitatus is to be raised where a riot is committed, a possession kept upon a forcible entry, or any force of rescue used contrary to the king's writ, or in opposition to the execution of justice; and it is the duty of all sheriffs to assist justices of the peace in the suppression of riots, &c. and to raise the posse comitatus, or to charge any number of men for that purpose.

POSSESSION, in law, is either actual, where a person actually enters into lands or tenements descended or conveyed to him; or where lands are descended to a person, and he has not yet entered into them. A long possession is much favoured by the law as an argument of right even though no deed can be shown, and it is more regarded than an ancient deed without possession.

If he that is out of possession of land brings an action, he must prove an undeniable title to it; and when a person would recover any thing of another, it is not sufficient to destroy the title of the person, in possession without he can prove that his own right is better than his.

In order to make possession lawful upon an entry, the former possessor and his servants are to be removed from off the premises entered on: but a person by lease and release is in possession without making any entry upon the lands.

POSSESSION, in Scots law. See **LAW**, Part III. N^o clxii. 11, &c.

Dæmoniacal Possession. (See **DÆMON** and **DÆMONIACS**.) In the third volume of the Manchester Transactions, there is a paper on *popular illusions* or medical demonology by Dr Ferriar. He informs us in a note, that, on the 13th of June 1788, George Lukins of Yatton in Somersetshire was exorcised in the temple church at Bristol, and delivered from the possession of seven devils by the efforts of seven clergymen. An account of his deliverance was published in several of the public papers, authenticated by the Reverend Mr Easterbrook, vicar of the temple church in Bristol.—Dr Ferriar gives us the following particulars, extracted from this account, which we shall here insert.

“Lukins was first attacked by a kind of epileptic fit, when he was going about acting Christmas plays, or mummeries: this he ascribed to a blow given by an invisible hand. He was afterwards seized by fits; during which he declared, with a roaring voice, that he was the devil, and sung different songs in a variety of keys. The fits always began and ended with a strong agitation

Posse
||
Possessor.

Coxe's
Travels.

Possession
||
Post.

Post.

agitation of the right hand. He frequently uttered dreadful execrations during the fits. The whole duration of his disorder was eighteen years.

"At length, viz. in June 1786, he declared that he was possessed by seven devils, and could only be freed by the prayers (*in faith*) of seven clergymen. Accordingly the requisite force was summoned, and the patient sung, swore, laughed, and barked, and treated the company with a ludicrous parody on the *Te Deum*. These astonishing symptoms resisted both hymns and prayers, till a *small, faint, voice* admonished the ministers to adjure. The spirits, after some murmuring, yielded to the adjuration, and the happy patient returned thanks for his wonderful cure. It is remarkable that during this solemn mockery, the fiend swore 'by his infernal den,' that he would not quit his patient; an oath, I believe, no where to be found but in the Pilgrim's progress, from which Lukins probably got it.

"Very soon after the first relation of this story was published, a person, well acquainted with Lukins, took the trouble of undeceiving the public with regard to his pretended disorder, in a plain, sensible narrative of his conduct. He asserts, that Lukins's first seizure was nothing else than a fit of drunkenness; that he always foretold his fits, and remained sensible during their continuance; that he frequently saw Lukins in his fits, & in every one of which, except in singing, he performed not more than most active young people can easily do; that he was detected in an imposture with respect to the clenching of his hands; that after money had been collected for him, he got very suddenly well; that he never had any fits while he was at St George's Hospital in London; nor when visitors were excluded from his lodgings, by desire of the author of the Narrative; and that he was particularly careful never to hurt himself by his exertions during the paroxysm.

"Is it for the credit of this philosophical age, that so bungling an imposture should deceive seven clergymen into a public act of exorcism? This would not have passed even on the authors of the *Malleus Maleficarum*; for they required signs of supernatural agency, such as the suspension of the possessed in the air, without any visible support, or the use of different languages, unknown to the demoniac in his natural state."

POSSESSIVE, in grammar, a term applied to pronouns which denote the enjoyment or possession of any thing either in particular or in common: as *meus*, "mine;" and *tuus*, "thine."

POSSESSORY ACTION, in Scots Law. See LAW, n° clxxxiii. 18.

POSSIBILITY, in law, is defined to be any thing that is altogether uncertain, or what may or may not be.

POSSIBILITY, also denotes a non-repugnance to existing, in any thing that does not any way exist.

POSSIBLE, is sometimes opposed to real existence, and is understood of a thing, which, though it actually does not exist, yet may exist; as a new star.

POSSIDONIA, (anc. geog.) See **POESTUM**.

POST, a word derived from the Latin *positus*, "set or placed." It is used in several different meanings, but all of them referring either immediately or remotely to this primitive sense of *position*. Thus the word Post signifies, 1. A stake or piece of timber set upright; 2. A

station, particularly a military station; 3. An office or employment; 4. An operation in book-keeping; 5. A conveyance for letters or dispatches; 6. A particular mode of travelling.

POST, a stake or piece of timber set upright. Posts are used both in building and in fencing ground. In brick-buildings much of the strength of the fabric depends on the nature of the posts; as it is through them that the several parts are sustained and held together. The *corner posts* are called the *principal posts*; those formed into bressummers between principal posts for strengthening the carcase of the house are called the *prick-posts*. Posts which are to be set in the ground ought to be well seasoned and coated to preserve them from rotting; burning the downward end has been recommended as an excellent preservative, but a coating of pitch or tar, particularly the late invented coal-tar, can be most safely relied upon. For the various uses to which posts may be applied, and the form and species of them fittest to be employed in each case, see the articles ARCHITECTURE, JOINING, GARDENING, HOUSE, FENCE, &c. In architecture and sculpture **POSTS** is a term used to denote certain ornaments formed after the manner of rolls or wreathings.

POST, a station, particularly a military station.—Any place where persons are set or placed upon particular occasions may be termed a *post*; but the word in this view is now chiefly restricted to military operations, and means any place or situation where soldiers are stationed. Thus the detachments established in front of the army are termed the *out-posts*, the stations on the wings of the army are said to be the *posts of honour*, as being the most conspicuous and most exposed. But in the operations of a campaign, a *post* properly signifies any spot of ground capable of lodging soldiers, or any situation, whether fortified or not, where a body of men may make a stand and engage the enemy to advantage. The great advantages of good posts, in carrying on war, as well as the mode of securing them, are only learned by experience. Barbarous nations disdain the choice of posts, or at least are contented with such as immediately fall in their way; they trust solely or chiefly to strength and courage: and hence the fate of a kingdom may be decided by the event of a battle. But enlightened and experienced officers make the choice of posts a principal object of attention. The use of them is chiefly felt in a defensive war against an invading enemy; as by carrying on a war of posts in a country where this can be done to advantage, the most formidable army may be so harassed and reduced, that all its enterprises may be rendered abortive. Indeed in modern times this is so well understood, that pitched battles have become much more rare than formerly, manœuvring and securing of posts being considered as the most essential objects in the conduct of a campaign; a change in the art of war much to the advantage of humanity; skill, conduct, and prudence, having thus obtained the ascendancy over brutal courage and mere bodily strength. In the choice of a post, the general rules to be attended to are, that it be convenient for sending out parties to reconnoitre, surprise, or intercept the enemy; that if possible it have some natural defence, as a wood, a river, or a morass, in front or flank, or at least that it be

Post.

be difficult of access and susceptible of speedy fortification; that it be so situate as to preserve a communication with the main army, and have covered places in the rear to favour a retreat; that it command a view of all the approaches to it, so that the enemy cannot advance unperceived and rest concealed, while the detachment stationed in the post are forced to remain under arms; that it be not commanded by any neighbouring heights; and that it be proportioned in extent to the number of men who are to occupy and defend it. It is not to be expected that all these advantages will often be found united; but those posts ought to be selected which offer the greatest number of them. See *WAR, Index*.

POST, an office or employment. This use of the word is probably derived immediately from the idea of a military station; a post being used to express such offices or employments as are supposed either to expose the holder to attack and opposition, or to require abilities and exertion to fill them. Hence the term is used only for *public* offices, and employments under the government; and were strict propriety of speech always attended to, *posts* would denote those stations only in which duty must be performed. In common language, however, every *public* office or appointment, even though nominal and sinecure, goes under the name of a *post*.

POST, an operation in book-keeping. Posting in book-keeping means simply the transferring an article to the place in which it should be put, and arranging each under its proper head. It is upon this that the whole theory of book-keeping is founded. The Waste-book, which is the groundwork of all subsequent operations, records every transaction exactly in the order in which it occurs. From this the several articles are posted, or transferred into the Journal, which in fact is but a kind of supplementary book to the Waste-book. From the Journal they are posted anew into the Ledger; in which a separate place is appropriated for each person with whom transactions are carried on, and frequently for every separate article about which the business is concerned. The particular mode according to which such transferences are made, may vary according to the nature of the trade carried on; the object is the same in all, to place every article so as that its operations on the general state of the business may be certainly known and distinctly traced. For a full account of the way in which this is done, see *Book-Keeping*.

POST, a conveyance for letters or dispatches.

In the early periods of society, communication between the different parts of a country is rare and difficult, individuals at a distance having little inclination or opportunity for mutual intercourse: when such communication is at any time found necessary, a special messenger must be employed. As order and civilization advance, occasions of correspondence multiply. In particular, the government finds it requisite frequently to transmit orders and laws to every part of the country; and for doing so he makes use of couriers or messengers, to whom he commits the charge of forwarding his dispatches. But without stations in the way, where the couriers can be certain of finding refreshment for themselves and supplies of what may be necessary for carrying them forward, the journey, however urgent and important, must always be retarded, and in many cases

altogether stopped. Experience, therefore, soon pointed out the necessity of ensuring such accommodations, by erecting upon all the great roads houses or stations at convenient intervals, where the messengers might stop, as occasion required, and where too, for the greater convenience, relays of fresh horses should always be in readiness, to enable them to pursue their journey with uninterrupted dispatch. These houses or stations were with great propriety termed *posts*, and the messenger who made use of them a *post*. Though at first, it is probable, the institution was intended solely for the government and the necessities of the state; yet by degrees individuals, seeing the benefit resulting from it, made use of the opportunity to carry on their own correspondence; for which they were willing to pay an allowance to the government. Thus a post-office, of some kind or other, gradually came to be established in every civilized country. Without taking notice of the different means of carrying on correspondence said to have been attempted by pigeons, dogs, and other animals, we can at least trace with certainty the invention of something like regular posts as far back as the ancient Persians. Xenophon assures us, that they were invented by Cyrus on his Scythian expedition, about 500 years before Christ; that the houses at the several stations were sumptuously built, and large enough to contain a number of men and horses; and that every courier on his arrival was obliged to communicate his dispatches to the postmaster, by whom they were immediately forwarded. From the shore of the Egean sea to Susa the capital, there were, according to Herodotus, 111 stages for posts, each a day's journey distant from the preceding.

In what manner posts were established and conducted among the Greeks does not clearly appear; but from the extended commerce carried on, and the frequent communications enjoyed among the different states, there can be no doubt that a regular conveyance, in some form or other, was established.

Though posts were well known among the Romans, yet it is difficult to trace with certainty the period of their introduction. Some writers carry it back to the times of the republic; posts and post-offices, under the names of *stateres* and *stationes*, having been then, it is said, established by the senate. Whether this was the case or not, Suetonius assures us that Augustus instituted posts along all the great roads of the empire. At first the dispatches were conveyed from post to post by young men who run on foot, and delivered the dispatch to others at the next stage. By and by Augustus substituted, in room of these, horses and chariots, both for the conveyance of dispatches and the convenience of travelling. His successors continued the same establishment; to the maintenance of which every subject of the empire was obliged to contribute. Post-horses are mentioned in the Theodorian code *de cursu publico*; but these were only the public horses appointed to be kept there for the use of the public messengers, who before this institution seized any that came in their way. At each post-station, according to Procopius, 10 horses and as many postilions were kept, and the usual rate of their travelling was from five to eight stations a-day.

It is to be observed, however, that all these establishments of posts in ancient times were formed as much, if not more, for travelling stations, than for the mere

Post.

Post.

conveyance of letters and dispatches. This latter object, it is true, was thereby secured; but the epistolary correspondence of antiquity was probably at no time so extensive as to require or maintain post-offices on the footing of modern posts, for the mere conveyance of letters. It is in later times only when the extension of commerce and diffusion of literature gave occasion to frequent communication, that these establishments are to be looked for.

The earliest institution of *posts* that occurs in modern history is about the year 807 by the emperor *Charlemagne*; who, having reduced under his dominion Italy, Germany, and a part of Spain, established three public posts at the public expence, to carry on the communication with these three provinces. The institution of posts, however, like many other institutions of that emperor, dropped at his death, and for a considerable time afterwards no traces of any such establishment are to be found. We cannot indeed discover them with certainty sooner than 1464, when that restless and suspicious prince Louis XI. established posts in France, that he might be the sooner advertised of all that passed in his own or the neighbouring kingdoms. He employed in this service 230 couriers, who delivered the letters at the different stations, and in the various towns through which they passed in their course. Succeeding monarchs created at different times certain offices for the express purpose of superintending the posts; but the frequent changes to which these offices were exposed, prevented for a long time the establishment of any regular system of posts in that kingdom; insomuch that in 1619 the author of the life of the duke d'Epemon says the packet or letter-office was not yet set up in France. Former establishments, it is probable, were solely for the use of the court, not for the general good of the nation. From France, the institution gradually spread through several other parts of Europe. In Germany, Lewis Hornig assures us they were first introduced by Count Taxis, who settled them at his own expence; in acknowledgment for which the Emperor Matthias in 1616 gave as a fief the office of postmaster to him and his descendants.

In England, the establishment of posts in some form or other appears as early as the reign of Edward III. but the notices concerning them are so vague, that no account can be given of them. In the reign of Edward VI. however, some species of posts must have been set up, as an act of parliament passed in 1548, fixing the rate of post-horses at one penny *per* mile: The post-horses here referred to were, it is probable, chiefly for travelling, and the carriage of letters or packets only an occasional service. In 1581, we find in Camden's Annals mention made of a chief postmaster for England being appointed.—How this office was managed, does not clearly appear; the limited state of the correspondence of the country, probably rendered it of trifling consequence. King James I. originally erected a post-office, under the controul of one Matthew de Quester or de l'Equester, for the conveyance of letters to and from foreign parts; which office was afterwards claimed by Lord Stanhope; but was confirmed and continued to William Frizel and Tho. Witherings, by king Charles I. in 1632. Previous to this time, it would appear that private persons were in use to convey letters to and from foreign parts; all such interference with the post-

master's office is therefore expressly prohibited. King Charles, in 1635, erected a letter office for England and Scotland, under the direction of the above Thomas Witherings. The rates of postage then established were, two-pence for every single letter for a distance under 80 miles; four-pence from 80 to 140 miles; six-pence above 140 miles. The allowance to the postmasters on the road for horses employed in these posts was fixed at two-pence halfpenny *per* mile for every single horse. All private inland posts were discharged at this time; and in 1637 all private foreign posts were in like manner prohibited. The posts thus established, however, extended only to a few of the principal roads; and the times of transmission were not in every case so certain as they ought to have been.

Witherings was superseded for abuses in the execution of his offices in 1640, and they were sequestered into the hands of Philip Blamachy, to be exercised under the care and oversight of the king's principal secretary of state. On the breaking out of the civil war, great confusions and interruptions were necessarily occasioned in the conduct of the letter-office: but it was about that time that the outline of the present more extended and regular plan seems to have been conceived by Mr Edmond Prideaux, who was afterwards appointed attorney-general to the commonwealth. He was chairman of a committee in 1642 for considering the rate of postage to be set upon inland letters; and some time after was appointed postmaster by an ordinance of both houses of parliament; in the execution of which office he first established a *weekly* conveyance of letters into *all* parts of the nation. In 1653, this revenue was farmed for L. 10,000 for England, Scotland, and Ireland; and after the charge of maintaining postmasters, to the amount of L. 7000 *per annum*, was saved to the public. Prideaux's emoluments being considerable, the common council of London endeavoured to erect another post-office in opposition to his; but they were checked by a resolution of the house of commons declaring that the office of postmaster is, and ought to be, in the sole power and disposal of the parliament. This office was farmed by one Maubey in 1654. In 1656 a new and regular general post-office was erected by the authority of the protector and his parliament, upon nearly the same model that has been ever since adopted, with the following rates of postage: For 80 miles distance, a single letter two-pence; for a greater distance, not out of England, three-pence; to Scotland, four pence. By an act of parliament passed soon after the restoration in 1660, the regulations settled in 1656 were re-established, and a general post-office similar to the former, but with some improvements, was erected. In 1663 the revenue of the post-office was found to produce L. 21,500 annually. In 1685 it was made over to the king as a branch of his private income, and was then estimated at L. 65,000 *per annum*. The year after the revolution the amount of the post-office revenue was L. 90,504: 10: 6. At the union the produce of the English post-office was stated to be L. 101,101. In 1711 the former establishments of separate post-offices for England and Scotland, were abolished; and by the stat. 9 Anne, c. 10. one general post-office, and one postmaster-general, were established for the whole united kingdom; and this postmaster was empowered to erect chief letter-offices at *Edinburgh*, at *Dublin*,

Post.

Post. *Dublin at New York*, and other proper places in America and the West Indies. The rates of postage were all increased at this time as follows.—In England, for all distances under 80 miles 3 d.; above 80 miles 4 d. From London to Edinburgh 6 d. In Scotland, under 50 miles 2 d.; from 50 to 80 miles 3 d.; above 80 miles 4d. In Ireland, under 40 miles 2 d.; above 40 miles 4d.—By the above act all persons, except those employed by the postmaster, were strictly prohibited from conveying letters. That year the gross amount of the post office was L. 111,561 17s 10d. The nett amount, on a medium, of the three preceding years, was, in the printed report of the commissioners, for the equivalent stated to be for England, L. 62,000, and for Scotland L. 2000. In 1754 the gross revenue of the post-office for Great Britain amounted to L. 210,663, in 1764 to L. 281,535, and in 1774 to L. 345,321.—The privilege of franking letters had been enjoyed by members of parliament from the first erection of the post-office; the original design of this exemption was, that they might correspond freely with their constituents, on the business of the nation. By degrees the privilege came to be shamefully abused, and was carried so far, that it was not uncommon for the servants of members of parliament to procure a number of franks for the purpose of selling them; an abuse which was easily practised, as nothing more was required for a letter's passing free than the subscription of a member on the cover. To restrain these frauds, it was enacted, in 1764, that no letter should pass free unless the whole direction was of the member's writing, and his subscription annexed. Even this was found too great a latitude; and by a new regulation in 1784, no letter was permitted to go free unless the date was marked on the cover in the member's own hand-writing, and the letter put into the post-office the same day. That year the rates of postage were raised in the following proportions: an addition of 1 d. for a single stage; 1 d. from London to Edinburgh; 1 d. for any distance under, and 2 d. for any distance above, 150 miles. An addition to the revenue of L. 120,000 was estimated to arise from these regulations and additional rates. In all the statements of duties upon postage of letters given in this account, the rates mentioned are those upon single letters, double letters pay double, treble letters treble, an ounce weight quadruple postage; all above are charged by the weight in the same proportion.

About the year 1784, a great improvement was made in the mode of conveying the mails, upon a plan first suggested in 1782 by Mr John Palmer. Diligences and stage coaches, he observed, were established to every town of note in the kingdom; and he proposed that government, instead of sending the mails in the old mode, by a boy on horseback, should contract with the masters of these diligences to carry the mail, along with a guard for its protection. This plan, he showed, could not fail to ensure much more expeditious conveyance, the rate of travelling in diligences being far quicker than the rate of the post; and it was easy to carry it into execution with little additional expence, as the coach owners would have a strong inducement to contract at a cheap rate for conveying the mail, on account of the additional recommendation to passengers their carriages would thereby acquire in point of security, regularity, and dispatch.

VOL. XV.

Post. Tho' government heartily approved of this plan, and the public at large were satisfied of its utility; yet, like all new schemes, however beneficial, it met with a strong opposition: it was represented by a number of the oldest and ablest officers in the post-office, not only as impracticable, but dangerous to commerce and the revenue. Notwithstanding of this opposition, however, it was at last established, and gradually extended to many different parts of the kingdom; and, upon a fair comparison, it appeared that the revenue was improved, and the plan itself executed for L. 20,000 *per annum* less than the sum first estimated by Mr Palmer.

The present establishment of the general post-office for Great Britain, consists of two postmasters-general, a secretary, surveyor, comptroller-general, and upwards of 150 assistants and clerks for the head letter office in London; the number of deputy postmasters and other officers through the kingdom is very considerable, but not easy to ascertain with accuracy, as it must frequently vary with the changes made in the establishment of country posts. The total expence of this branch of the revenue in 1788 was L. 149,029, 17s. 2 d. the gross produce may now be reckoned at L. 650,000.

The first accounts we have of the establishment of a post-office in Scotland reach no farther back than 1635, when Charles I. erected one both for Scotland and England. The post to Scotland by that appointment was to run night and day, to go from London to Edinburgh and to return in *six* days, taking with it all letters intended for any post-town in or near the road; the rate of postage from London to Edinburgh was 8 d. for a single letter. The expedition with which the post went from London to Edinburgh at this time, is indeed surprising, considering the nature of the roads; perhaps, however, though the king made the regulation that it should go and return in six days, the journey was not always performed in the specified time. During the government of Cromwell, the public post conveyed letters to Scotland as well as England; the postage from London to Scotland was only 4 d. After the Restoration, when the post-office was erected for England, mention is made in the act of parliament of the conveyance of letters to Scotland; and the postage to Berwick is fixed at 3d. For some time after, however, we find no establishment by act of parliament of an internal post in Scotland. In 1662, a post between Ireland and Scotland was first established; and the privy council gave Robert Main, who was then postmaster-general for Scotland, an allowance of L. 200 Sterling to build a packet-boat for conveying the mail between Portpatrick and Donaghade: the postage to Ireland was 6d. In 1669, a post was established to go between Edinburgh and Aberdeen twice a-week, and between Edinburgh and Inverness once a-week: the rate of postage was fixed, for 40 Scots miles 2d. and for every 20 miles farther an additional penny. These appear to have been the only *public* posts in Scotland at that time; but as they could not suffice for the correspondence of the country, there must have been more, either under the direction of the postmaster, or in the hands of private persons; probably there might be of both kinds. In 1690, an act for the security of the common post was passed, subjecting robbers of the mail to capital punishment. It was not till 1695 that the establishment of the post-office in Scotland received the

Post.

function of parliament: posts were then appointed for all parts of Scotland; the rates of postage were fixed, for any place within 50 miles of Edinburgh 2 d. between 50 and 100 miles 3 d. all places above 100 miles 4 d. By the same act, a weekly packet to Ireland was established, and L. 60 Sterling annually allowed for that service. Though posts were established in consequence of this act, yet such was their mode of travelling, that they hardly deserved the name. Thus, for instance, the person who set out to carry the mail from Edinburgh to Aberdeen, in place of stopping at the first intermediate stage from Edinburgh, and delivering over the mail to another, to be carried forward, went on with it himself the whole journey, resting two nights by the way, first at Dundee, and next at Montrose.

In this manner the mail was conveyed thrice a-week from Edinburgh to Aberdeen; but between most parts of Scotland the post went only twice, and between some only once a-week. The post-boy generally travelled on foot. Horses were but little used in the service of the post-office.

At the Union, the Scots post-office was farmed for L. 1194: in 1710, the nett amount for Scotland was reckoned to be L. 2000. The epistolary correspondence of Scotland must have been small indeed, when even the rates of postage then established proved so very unproductive. This may perhaps, however, be in part accounted for, by conjecturing, that as private posts had probably prevailed pretty much before 1695, it was long before these were entirely suppressed, the people still adhering to their old conveyances, and difficulties occurring in strictly enforcing the law; the amount of the post-office revenue, therefore, at the two periods above-mentioned probably exhibits a view of only a part of the correspondence of Scotland.

In 1711, it has been already mentioned, one general post-office was established for the whole united kingdom; but the postmaster-general was authorised to erect at Edinburgh a chief letter office for Scotland.— This was accordingly done, and a postmaster-general for North Britain, with other necessary officers, appointed. All the deputy postmasters in Scotland are under his immediate direction, but he himself is under the controul of the postmaster-general for Great Britain. From this head letter office posts were established to the different parts of Scotland.

For many years the post-boys generally travelled on foot, or if on horseback, without a change of horses. It was not till about 1750 that the mail began to be conveyed from stage to stage by different post-boys and fresh horses to the principal places in Scotland, and by foot runners to the rest. The communication between London and Edinburgh was at first but thrice a-week, and so slow, that the mail from London to Edinburgh was upon the road 85 hours, and from Edinburgh to London 131 hours. In 1757, upon a representation from the royal boroughs, regulations were fallen upon, by which the time was shortened to 82 hours in the one case, and 85 in the other. By the extension of Mr Palmer's plan to Scotland, the time has been still farther shortened to about 60 hours in each case.

The establishment of the Scots post-office, which has been gradually enlarged as the state of the country required, consists at present of a postmaster-general, secretary, solicitor, and accountant, with a number of

other clerks and assistants for the head office at Edinburgh; under its management are about 180 deputy-postmasters for the different post-towns through Scotland.

The nett produce of the post-office for Scotland in 1733 was L. 5399, in 1754 L. 8927, in 1757 L. 10,623, in 1760 L. 11,942, in 1776 L. 31,103. In 1788 the gross produce was L. 55,836, the expence L. 22,636, 13 s. 6 d.: in 1793 the gross amount was about L. 64,000, the nett produce about L. 40,000.

Penny-Post, a post established for the benefit of London and other parts adjacent, whereby any letter or parcel under 16 ounces weight, or L. 10 value, is speedily and safely conveyed to and from all places within the bills of mortality, or within 10 miles of the city. It is managed by particular officers, and receiving houses are established in most of the principal streets, for the more convenient transmission of the letters. Some other large towns have instituted similar establishments.

About 20 years ago a penny-post was set up in Edinburgh by an individual, unconnected with the general post-office. It met with but indifferent encouragement for some years, doubts being entertained as to its punctuality in delivering the letters; by degrees, however, it seemed to be advancing in estimation, and was more frequently employed. About a year ago, the general post-office, in virtue of the act of parliament prohibiting the conveyance of letters by any but those employed under the postmaster-general, took the penny-post entirely into its own hands; and at present letters are transmitted from the general post-office to the different quarters of Edinburgh and the suburbs, three or four times a-day.

Post, a particular mode of travelling. A person is said to *travel post*, in contradistinction to common journey travelling, when, in place of going on during his whole journey in the same vehicle, and with the same horses, he stops at different stages, to provide fresh horses or carriages for the sake of greater convenience and expedition. As he thus uses the same mode of travelling that is employed for the common post, he is said to travel post, or in post, *i. e.* in the manner of a post.

In tracing the origin of posts, it has been already remarked, that the more ancient establishments of this kind were fully as much for *travelling stations* as the conveyance of letters. The relays of horses provided at these public stations for the messengers of the prince, were occasionally, by special licence, allowed to be used by other travellers who had sufficient interest at court. Frequent demands of this nature would suggest the expedient of having in readiness supplies of fresh horses or carriages over and above what the *public* service required, to be hired out to other travellers on payment of an adequate price. We find, therefore, that in former times the postmasters alone were in use to let out horses for riding post, the rates of which were fixed in 1548 by a statute of Edward VI. at one penny *per* mile. In what situation the state of the kingdom was with regard to travelling post for more than a century after this period, we cannot now certainly discover; but in the statute re-establishing the post-office in 1660, it is enacted, that none but the postmaster, his deputies, or assigns, shall furnish post-horses for travellers; with a proviso, however, that if he has them not ready in half an hour after

Post.

Post. after being demanded, the traveller shall be at liberty to provide himself elsewhere.

The same prohibition is contained in the act establishing the Scots post-office in 1695, as well as in the subsequent act of Queen Anne, erecting the general office for the united kingdom. It is doubtful, however, whether it ever was strictly enforced. By an explanatory, act of 26 Geo. II. the prohibition is confined to post-horses only, and every person declared to be at liberty to furnish carriages of every kind for riding post. This regulation has, in fact, done away the prohibition, as hardly any person now thinks of travelling post except in a carriage.

The rate fixed by the act 1695, in Scotland, for a horse riding post, was three-pence *per* Scotch mile. By the act 9 Anne, c. 10. three-pence a-mile without, and four-pence a-mile with, a guide, was the sum fixed for each horse riding post. The increase of commerce, and necessity for a speedy communication between different parts of the kingdom, have brought the mode of travelling post so much into use, that upon every great road in the kingdom post-chaises are now in readiness at proper distances; and the convenience of posting is enjoyed in Britain to a degree far superior to what is to be met with in any other country whatever.

Posting at last appeared to the legislature a proper object of taxation. In 1779 the first act was passed, imposing duties on horses hired either by themselves or to run in carriages travelling post: the duties were, one penny *per* mile on each horse if hired by the mile or stage, and one shilling *per* day if hired by the day. Every person letting out such horses was also obliged to take out a licence at five shillings *per annum*. These duties were next year repealed, and new duties imposed, of one penny *per* mile on each horse hired by the mile or stage, and 1s. 6d. on each if hired by the day. A number of additional regulations were at the same time enacted for securing these duties. An addition of one halfpenny *per* mile, or three-pence *per* day, for each horse riding post, was imposed in 1785, by Stat. 25 Geo. III. c. 51. The duty is secured, by obliging every letter of horses to deliver to the person hiring them a ticket, expressing the number of horses hired, and either the distance in miles to be travelled, or that the horses are hired by the day, as the case happens to be. These tickets must be delivered to the bar-keeper at the first turnpike through which the traveller passes; and the turnpike-keeper gives, if demanded, what is termed an *exchange* ticket, to be produced at the next turnpike. The stamp-office issues to the person licensed to let post-horses such a number of these tickets as is required, and these must be regularly accounted for by the person to whom they are issued. As an effectual check upon his account, the turnpike-keeper is obliged to return back to the stamp-office all the tickets he takes up from travellers. Evasions are by these means rendered difficult to be practised without running a great risk of detection. In 1787, for the more effectually levying the post-horse duties, a law was passed, authorising the commissioners of the stamp-office to let them to farm by public auction, for a sum not less than the produce in the year ending 1st August 1786.

In the advertisement published by the commissioners in consequence of this law, previous to the receiving proposals for farming them, the total amount of the

duty for Great Britain is stated to have been at the period above referred to, L. 119,873. The sum for which that duty was farmed in 1794 amounted in all to L. 140,030, of which the district of North Britain was L. 6000.

Soon after the tax was imposed, considerable difficulties were raised about the meaning of the term *posting*, and what mode of journeying should subject travellers to duty. The old law, Stat. 9 Anne, c. 10. explained posting to be "travelling several stages, and changing horses;" but the acts imposing the posting duties expressly declare, that "every horse hired by the mile or stage shall be deemed to be hired to travel post, although the person hiring the same doth not go several stages upon a post road, or change horses;" and that "every horse hired for a day or less period of time, is chargeable with the duty of three halfpence *per* mile, if the distance be then ascertained; and if the distance be not then ascertained, with 1s. 6d. each horse." Horses hired for any less time than two days are by these acts to be deemed to be hired for a day. An action was brought in 1788, in the court of exchequer at Edinburgh, to determine whether several disputed cases fell under the meaning of the act, and were liable to duty; when the following decisions were given:

Saddle-horses both hired and paid by the mile, and saddle-horses hired originally for an excursion, but afterwards paid by the mile, were found liable to duty according to the number of miles paid for; carriage-horses, where the carriage is hired and paid for only at the usual rate of *outgoing* carriages, and no more, whether the person hiring it does or does not return in it, were found liable to duty only for the number of miles *out*; but if the carriage be hired and paid for, or actually paid for though not originally hired, at the usual rate of carriages employed both to carry out and bring back the same company, the duty was found to be exigible according to the number of miles both out and home taken together. Hackney-coaches in Edinburgh, hired and paid for less than two miles, were found liable to duty for one mile.

No duty was found to be exigible on saddle-horses hired for a mere excursion, and paid for accordingly, where the distance neither is nor can be ascertained, on hackney-coaches employed in the streets for less than a mile, or for an excursion or round of visits merely; and on horses or carriages hired for a journey of three days or more, and paid for accordingly, or paid for at the rate of three days, though the journey should actually be performed in two full travelling days. The general rule of these decisions was, that in every case, except unascertainable distance, or journeys exceeding two days, the mode of travelling fell under the legal definition of posting. The only point that may seem doubtful in the judgments here stated, is that where the duty is found chargeable by the number of miles both going and returning. Yet as the law expressly declares, that horses hired by the mile or stage are to be deemed *posting*, and as the number of miles for which they are hired can only be ascertained by the number paid for, it is clear, that where an addition to the outgoing charge is made on account of bringing back the person hiring the carriage, the carriage in that case is actually hired and paid for according to the number of miles both out and home, and the duty must fall to be rated accordingly.

Posterior
||
Posture.

ingly. The doubtful points being now settled by the above decisions, the mode of levying the duty in Scotland has been regulated agreeably to them ever since the matter was thus determined.

POSTERIOR, a term of relation, implying something behind, or that comes after, another. In which sense it is used in opposition to *prior* and *anterior*.

The back and hips are the posterior parts of man. Aristotle has given prior and posterior analytics. A date is posterior to another, when it is later or fresher.

POSTERN, in fortification, a small gate, usually made in the angle of the flank of a bastion, or in that of the curtain, or near the orillon, descending into the ditch; whereby the garrison can march in and out, unperceived by the enemy, either to relieve the works, or to make private sallies, &c.

The word is also used in the general for any private or back-door.

POSTHUMOUS a child born after the death of his father, or taken out of the body of a dead mother; from whence it is frequently applied to the works of an author not published till after his decease.

POSTIL, a name anciently given to a note in the margin of the Bible, and afterwards to one in any other book posterior to the text.

POSTING, among merchants, the putting an account forward from one book to another, particularly from the journal or waste-book to the ledger. See **Post** and **BOOK-KEEPING**.

POSTLIMINIUM, among the Romans, the return of one who had gone to sojourn elsewhere, or had been banished, or taken by an enemy, to his own country or state.

POSTPONING, putting any thing after or behind another with regard to time.

POSTSCRIPT, an article added to a letter or memoir, containing something learnt or recollected after the piece was written.

POSTULATE, in mathematics, &c. is described to be such an easy and self-evident supposition, as needs no explication or illustration to render it intelligible; as that a right line may be drawn from one point to another.

POSTURE, in painting and sculpture, the situation of a figure with regard to the eye, and of the several principal members thereof with regard to one another, whereby its action is expressed. A considerable part of the art of a painter consists in adjusting the postures, in giving the most agreeable ones to his figures, in accommodating them to the characters of the respective figures, and the part each has in the action, and in conducting and in pursuing them throughout.

Postures are either natural or artificial.

Natural postures are such as nature seems to have had a view to in the mechanism of the body, or rather such as the ordinary actions and occasions of life lead us to exhibit while young, and while the joints, muscles, ligaments, &c. are flexible.

Artificial postures, are those which some extraordinary views or studies occasion us to learn; as those of dancing, fencing, &c. Such also are those of our balance, and posture masters.

A painter would be strangely puzzled with the figure

of Clark (a late famous posture-master in London) in a history-piece. This man, we are told in the *Phil. Transf.* had such an absolute command of his muscles, &c. that he could disjoint almost his whole body; so that he imposed on the great surgeon Mullen, who looked upon him as in such a miserable condition, he would not undertake his cure. Though a well-made man, he would appear with all the deformities imaginable; hunch-backed, pot-bellied, sharp-breasted, &c. He disjointed his arms, shoulders, legs, and thighs; and rendered himself such an object of pity, that he has frequently extorted money, in quality of a cripple, from the same company in which he had the minute before been in quality of a comrade. He would make his hips stand a considerable way out from his loins, and so high as to invade the place of his back. Yet his face was the most changeable part about him, and showed more postures than all the rest.

POTAMOGETON, **POND-WEED**: A genus of the tetragynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 15th order, *Inundatæ*. There is no calyx; but four petals; no style, and four seeds. There are 12 species, all of them floating vegetables on the surfaces of stagnant waters, affording an agreeable shade to fish, and food to cattle.

POTAMON or **POTAMO**, was a philosopher of Alexandria. He kept a middle course between the scepticism of the Pyrrhonians and the presumption of the dogmatists; but attached himself to none of the schools of philosophy of his time. He was the first projector of the Eclectic sect; for though that mode of philosophizing had been pretty common before, he was the first that attempted to institute a new sect on this principle. "Diogenes Laertius relates, that not long before he wrote his *Lives of the Philosophers*, an Eclectic sect, *ἐκλεκτικὴ τις αἵρεσις*, had been introduced by Potamo of Alexandria, who selected tenets from every former sect. He then proceeds to quote a few particulars of his system from his Eclectic institutes, respecting the principles of reasoning, and certain general topics of philosophical inquiry; from which nothing further can be learned, than that Potamo endeavoured to reconcile the precepts of Plato with those of other masters. As nothing remains concerning this philosopher besides the brief account just referred to in Laertius, an obscure passage in Suidas, and another still more obscure in Porphyry; it is probable that his attempt to institute a school upon the Eclectic plan proved unsuccessful. The time when Potamo flourished is uncertain. Suidas places him under Augustus; but it is more probable, from the account of Laertius, that he began his undertaking about the close of the second century."

POTASH, the lixivious ashes of certain vegetables, used in making of glais, soap, &c. See **GLASS**, **SOAP**, &c.

The method of making potash is directed by Dr Shaw as follows. Burn a quantity of billet-wood to grey ashes; and taking several pounds of these ashes, boil them in water, so as to make a very strong lixivium, or ley. Let this ley be strained through a coarse linen cloth, to keep out any black parts of the half-burnt wood that might happen to remain in the ashes; then evaporate this strained lye in an iron-pan over a quick fire almost to dryness: then taking out the matter remaining.

maintaining at the bottom, and putting it into an iron crucible, set it in a strong fire till the matter is melted, and then immediately pour it out upon an iron plate, where it soon cools, and appears in the form of a solid lump of pot-ash *. Much after this manner is pot-ash made in the large way of business, for the service of the soap-boiler, glais-maker, fuller, &c. but according to the difference of the wood, or combustible matter employed, with the manner of turning it, and conducting the process, different kinds of potash are prepared. There are certain saline plants that yield this potash to great advantage, as particularly the plant kali; there are others that afford it in less plenty, and of an inferior quality, as bean-stalks, &c. but in general, all vegetable subjects afford it of one kind or other, and may most of them be made to yield it tolerably perfect after the manner of the process already laid down, even the lop-pings, roots, and refuse parts of ordinary trees, vine clippings, &c. The fixed salts of all vegetables excepting the kali and marine plants, when reduced to absolute purity, or entirely separated from the other principles, appear to be one and the same thing: whence it should seem, says Dr Shaw, that by a suitable management, good saleable potash might be made in all places where vegetable matters abound. For if by examining Russia (A) potash, for example, we find that its superiority or excellence depends upon its being clear of earth, or upon its containing a large proportion of oil, or refined salt, these advantages may, by properly regulating the operation, be given to English potashes, so as perhaps to render the latter as good as the former: but where the potash of any remarkable saline vegetable is to be imitated, that of the kali, for example, the Doctor recommends a prudent sprinkling of the subject with salt, or sea-water, in the burning; and by these ways, properly diversified, any principle that is naturally wanting might be artificially introduced so as to perfect the art of potash.

2
Account of
Mr Ste-
phens's ma-
nufacture.

About 40 years ago, or upwards, Mr Stephens, encouraged by the Society of Arts, &c. and by a parliamentary grant of 3000 l. established a manufacture of potash in North America, which produced such as was so perfectly good as to answer in bleaching and other uses the purposes of *pearl-ash*; and which at the same time afforded a very large produce. But the very great heat which his process required, occasioned the destruction of a very extensive apparatus; and other circumstances concurred to disappoint the hopes and check the spirit of the proprietors. The manufacture was, however, afterwards undertaken and prosecuted by others. Mr Stephens's apparatus was as follows: Fig. 1. A is the bed of the kiln, which flies off about four feet by

two from the grate, more or less according to the size; C is the ash-hole, 2½ or 3 feet deep. Fig. 2. B represents quadrangular bars of iron, with their opposite angles placed upwards and downwards, not above an inch asunder. Fig. 3. A, B, and C, are three steepers five feet deep, and of any width from four to eight feet square, of the best white pine or cyprus plank, with square joints and strong oak frames, placed each over a receiver, with a cock to let off the lye, and a vent just beneath the surface of the grating. E represents three receivers, standing each under, and projecting out, from its steeper. They must be made of the best stuff, carefully put together, and laid in tough clay well rammed within the ground, their tops being level with the surface: they need not be so large as the steepers by six, eight, or twelve inches. Fig. 4. F represents a false bottom or lattice of boards, eight inches deep and five square, with a hole in the under edge of every partition for the lye to pass into the steeper. Fig. 5. A is the vessel over the furnace in which the lye and ashes are mixed; B is a hole or funnel a few inches from the back of the furnace, with an iron socket to let the pipe through the hinder part of the arch, to reach down within two inches of the floor of the furnace. C is a cast iron cauldron for boiling the lye to dryness when pearl-ash is made. D is a vessel whence the liquor is let into the cauldron as it evaporates. The mortar for building the furnace should be made of loam; the arch should be 18 inches thick, and the floor should be laid with tiles on a layer of sand an inch thick, with neat joints.

Potash.
3
Of his ap-
paratus.

Mr Stephens's process, both with and without the kiln, was as follows. Cut timber, felled at any season, into lengths of about eight feet; lay from three to ten of them lengthwise in a heap upon dry ground, and fill the vacancies between with smaller wood: the sooner it is burnt after felling, the better. Set fire to it by laying embers on the bottom logs at each end; and for burning the brush and lappings, with other smaller woods, lay them lengthwise on the ground, top to top, lapping over a little, with the butt ends outwards, and as close as a faggot; laying the large woods on top till the heap is full four feet high, the length of the brush set against each other making the breadth of the heap. As to the choice of the timber, old hollow trees, if not dead, are best: pine, cyprus, and cedar, are to be totally rejected.

4
Process
without
using a
kiln.

As soon as the pile is burnt down, rake such ashes as lie round the outside a little in towards the middle; add no fresh fuel, nor throw on any brands. Let the ashes lie without stirring till you can just bear your hand in them; then carry them to a house, or under a shed, on a plank floor raised a little from the earth and well jointed;

Plate
CCCCXV.

(A) According to Sir Peter Warren, the best woods for making Russia potash are, oak, ash, poplar, hickory, elm, hazle, and beech. They must be cut in November, December, January, and February, split and stacked to dry. After 12 months in warm open weather, it must be burnt on a brick hearth by a slow fire in a kiln, or close place; the ashes must be sifted through two sieves, one finer than the other, and then put up in brick troughs or wooden backs, covered with rain or river water, and must remain well marshed and incorporated five months. Brick furnaces shaped like bakers ovens must be heated with a strong fire of oak or ash, burning night and day; the prepared ashes must be gradually thrown on the fire, when they will run into metal like lead: the fire must not go out till the furnace is nigh filled with potashes. The ashes must then be broken to be taken out, but the larger the pieces the better; they must be preserved from the air in tight casks, the large pieces by themselves, and the dust by itself.

Potash. jointed; there wet them till brought nearly to the consistence of mortar in the first mixture of lime and sand, and ram them in a heap, in which they must lie full 20 days, or some months if you please; observing to be more sparing of water in winter, and ramming them closer, and sometimes wetting the top that it may never grow quite dry.

5
And with
it.
Plate
CCCCXV.
Wood may also be burnt in a kiln, as fig. 1 and 2; and then it must be cut into such lengths as may be most convenient for carriage, and best suit the size of the kiln. The mouth of the ash-hole must be close stopped by daubing the joints of the lid with loam, or throwing a bank of sand or earth against it: keep the bed of the kiln filled with wood up to the surface, but not above it, and let it burn incessantly till the ashes rise within six or eight inches of the grate. Draw them out whilst red-hot, and in that state sprinkle them with lye, from four to six carats weight; weigh a small vial which holds about four ounces very exactly; then fill it with water and weigh that also: divide the weight of water into equal parts till you come to $\frac{1}{128}$ of the whole, which is called a *carat*, $\frac{1}{64}$ two carats, &c. until you have a weight equal to $\frac{1}{4}$ of the whole water, which is called 32 carats: all which small weights, together with one equal to the phial filled with water, are to be kept for weighing the lye in the said phial till they are made damp; then ram them as before in a heap, but separate from the ashes made as above. N. B. By kiln-burning a stronger lye may be more certainly procured than by the other way, where rain may chance to fall on the ashes before they can be removed.

The ashes thus prepared are to be put in vats or steepers fig. 3, with a false latticed bottom as fig. 4; first putting coarse wheat or rye straw about a foot thick on the lattice or grating; on which put ashes to within four or five inches of the top, ramming them all the way up, especially at the sides, with a small light rammer, as tight as you can, without burking the vat. Form on the top of the steeper a hollow basin in the ashes four or five inches deep, leaving the ashes four or five inches thick on the sides, by raising a small bank round the sides, so that the liquor may not overflow the edges of the ashes at top: keep this basin constantly filled with soft water in the steeper A, until the ashes will imbibe no more, which will be in 24 hours or more, according as it is rammed; then turn the cock, and let off what shall be soaked through into the receiver or lower chamber of the steeper, and no more; for if the several runnings are not kept separate, the lye will not be brought to its due strength. Follow that steeper with fresh water on the same ashes for several other runnings, which will each come off in a few days, till the liquor has neither smell nor taste; then heave out the ashes, and charge the steeper afresh.

Upon drawing off the first running from the steeper A, fig. 3, fill the steeper B with ashes as before, and put into its hollow at the top the lye so first run off, and the smaller or half lyes also, till full, and draw off as directed for the steeper A: if this weighs 18 carats or more, pump it into the cistern F as fit for use; if it be short of that, pass it off as half lye to the steeper C, and through fresh ashes till strong enough. With kiln-ashes only, from water passing through the first steeper, it will be strong enough for the cistern, if the ashes are well prepared. If your water be hard, let it stand two

or three days exposed to the air and sun in a shallow back, and it will be soft. When you use kiln-ashes with others, lay them at bottom.

The lye must be conveyed from the cistern F, as it is wanted to the vessel A fig. 5; where with every gallon of proof lye mix three ounces of fine, light, wood ashes; and to the lye that is $\frac{1}{2}$ over-proof put six ounces of ashes; and if $\frac{3}{4}$ over-proof 12 ounces, increasing or lessening according to the strength of the lye.

For evaporating the lye and melting the salt, heat a furnace till you bring it very near a white heat, of which the side-doors being red-hot is a mark. This will take 48 hours or more, if the furnace be quite cold; when thoroughly hot, a little fuel keeps it so. Then, through the cock of the vessel A, pass the mixture by the funnel B into the furnace, not so as to reach much beyond the middle of the floor, before it changes from dark to bright red, letting the heat prevail towards front or back as you see necessary. When the mass begins to gather about the flues or in heaps, run in no more till the furnace is cleared by driving the fire backward. You must have two funnels, one soon choaking: in an hour or less will issue out a red hot stream of melted salt, which is potash, to be broken to pieces as soon as cold, and packed in tight close casks, being in no respect inferior to the best foreign ash whatever.

The best potash is made from barilla, and comes from Spain. The plants from which it is procured are found in great plenty about Carthage, where they are indigenous, and may be collected in a swamp called *Almojar* east of that place; the *Sayones* barilla is the best. They are found, besides all along that coast, on the borders of the Mediterranean for 60 leagues in length and 8 in breadth. About 150,000 quintals of it are annually exported from Spain. It produces a revenue of 25,500l. a year; each quintal paying a duty of 17 reals: yet Don Bernardo de Ulloa, A. D. 1740, says it was farmed at L. 1822, 4 s. 3 d. M. Macdonnell has brought the manufacture of potash to its present perfection in Spain; but its exportation is materially injured by the heavy tax on it. See Townshend's *Travels*, vol. iii. p. 131. See also BARILLA, KELP, and FUCUS.

In the 70th volume of the Philosophical Transactions we have an account of a method of procuring this salt from the putrid water which runs from dunghills. The process is very easy, consisting only in simple evaporation of the fluid, and calcining the impure salt till most of the foulness is burnt out. From 24 wine-pipes full of this muck-water were obtained 9 cwt. 1 q. 12 lb. of saleable potash, valued at 42 s. per cwt; the expence of manufacturing them being only valued at 4 l. 9 s.

The potash thus made is of a greyish white appearance; deliquesces a little in moist air; but if kept in a dry room, near the fire, acquires a powdery surface. It is hard and of a spongy texture when broken, with many small crystals in its substance. The colour of its internal parts is dusky and variegated. To the taste it is acrid, saline, and sulphureous. It emits no smell of volatile alkali, either in a solid form, dissolved, or when added to lime-water; neither does it communicate the sapphire-colour to a solution of blue vitriol. Silver is quickly tinged black by it; a proof that it contains much phlogiston. Ten grains of this potash required 11 drops of the weak spirit of vitriol to separate it.

9
Dr Per-
cival's ac-
count of
making
potash.

Potash.

The like quantity of salt of tartar required 24 drops: a strong effervescence occurred in both mixtures; and a sulphureous vapour exhaled from the former. A tea spoonful of the syrup of violets diluted with an ounce of water was changed into a bright green colour by five grains of the salt of tartar; but ten grains of this potash were necessary to produce the same hue in a similar mixture. Half an ounce of the salt dissolved entirely in half a pint of hot water; but when the liquor was cold, a large purple sediment subsided to the bottom; and it was found that this sediment amounted to about two-thirds of the whole quantity of ashes used.

Dr Percival, the author of this paper, concludes with observing, that this potash is a true fixed vegetable alkali, produced by putrefaction; that the quantity of alkali contained in it may be estimated at one-third of its weight, whereas the white Muscovy ashes are said to yield only one-eighth part; that no quicklime appears to be contained in this potash, for a solution of it poured from its sediment remained clear though long exposed to the air: that it would be worth trying, whether the large purple sediment, which subsides when this potash is lixiviated, might not be applied to the manufacture of Prussian blue, or used in the manner recommended by Macquer for dyeing wool and silks; and that this manufacture will furnish the farmer for top-dressing for his garden and land, of great fertilizing powers. See *Phil. Trans.* Vol. LXX. p. 345.

These are the processes most essentially different from one another which have appeared concerning the manufacture of this useful salt. Some indeed have attempted to compose it on the supposition that alkali consisted of an earth combined in a peculiar manner with a certain acid. But the little success of all these attempts show that they have been built on a false principle. The only method of producing alkaline salts originally is from the ashes of vegetables; and the vegetable substances which yield the largest quantity of them are tartar and marine plants. From the former the purest and strongest vegetable alkali is obtained, and from the latter the mineral alkali. From other vegetables, as fern, broom, bean-stalks, &c. an alkaline salt is produced, but so impure, and in such small quantity, that no manufacture of it can be established with any reasonable expectations of profit.

8
Other attempts.

9
On extracting its alkaline part from rock-salt.

Dr Watson (the present bishop of Landaff) suggests, that the investigation of a method of extracting its alkaline part from rock-salt would be a most serviceable discovery. We have inexhaustible mines of rock salt in this country, which (he observes) the proprietors can afford at ten shillings a ton. A ton of rock salt contains about half a ton of mineral alkali, which is for most purposes far preferable to potash. To those who have leisure to attempt such a discovery he gives the following hint: whether the alkaline part of rock-salt may not be obtained by calcining it in conjunction with charcoal in open fires? His reason for this conjecture is founded upon the following experiment: upon burning sea-wreck to a black coal and stopping the process at that point, he has obtained great plenty of common salt, but no mineral alkali from the black ashes: though we are certain, that when the black ashes are thoroughly calcined, or reduced to white ashes, mineral alkali may be obtained from them. This makes it probable, that the common salt contained in the black ashes of

sea-wreck is decomposed, and changed into a mineral alkali, during the burning of the black ashes. There are reasons to suppose, that the cinder of pit-coal would answer the purpose better than charcoal. *Chem. Eff.* vol. i. p. 136, &c.

Potash.

The potashes of different countries vary much in quality; and the experiments of Dr Home, in his treatise on Bleaching, seem to set forth their different properties in the clearest point of view. The different kinds tried by him were,

10
Dr Home's experiments on the potashes of different countries.

Blue pearl-ashes. These appear to be a pure alkaline salt, mixed with a small quantity of vitriolated tartar and earth. Half a pound of this, filtered and evaporated, yielded $5\frac{1}{2}$ ounces of pure salt.—Here, however, we must observe, that though the quantity was so far diminished by this operation, yet we are not to imagine that the whole of this diminution was owing to impurities; for all salts are destroyed in some measure by solution in water and exsiccation.

2. *White pearl-ashes* are nearly of the same quality with the former; half a pound of them giving five ounces and seven drams of pure salt, with some vitriolated tartar and earth.

3. *Russia or Muscovy ashes* have very much the appearance of slacked lime, and are, like it, friable betwixt the fingers. They adhere to the tongue; and their alkaline taste soon goes away, leaving in the mouth a strong taste of lime. Some small bits of charcoal are observable in their composition, and they never turn moist in the air. Half a pound of the salt lixiviated with water and evaporated, gave only 10 drams 15 grains of very caustic salt. These consist therefore of a small quantity of alkaline salt united with a large quantity of lime.

4. *Cashub-ashes* are of the colour of iron stone, and extremely hard, with many shining particles of charcoal in them. They have a saline taste, with a considerable degree of pungency; feel gritty in the mouth when broke in pieces by the teeth; and will dissolve in water. To extract the pure salt, half a pound of the ashes were boiled in a pint of water; then that water poured off, and half a pint put on the ashes again; and so on, till the ashes tasted no more salt. This boiling took 24 hours, and the last water that came off had a strong taste of sulphur, and was blackish. A piece of silver put in the decoction was in a few minutes turned almost black; but though the decoction was evaporated considerably, it did not turn silver black more speedily than before. The whole, when totally evaporated, yielded only 10 drams of a brown salt having a strong caustic alkaline taste. Some Cashub-ashes powdered, and often washed in water so that the salts were all carried off, were infused in water. After standing some time, there was a weak lime-water, with something of a saline taste, but no pellicle. Some of this residuum was put into a reverberatory furnace for two hours; after which it afforded good lime-water. Cashub-ashes then appear to contain an earth half vitrified, some lime, alkaline salts, and a quantity of sulphur.

5. *Marcoft-ashes*, are of a paler colour than the former, with some small pieces of charcoal in their composition. They have a strong saline taste; and so great pungency, that they cannot be held long in the mouth. Half a pound dissolved in water, filtered and evaporated, yielded 11 drams one scruple and two grains of alkaline

Potash.

Potash.

11
On manu-
facturing
them in
Britain.

kaline residuum. The decoction blackened silver, but not so strongly as the former; and by evaporation it quickly lost that quality.

Our author next proceeds to consider the probability of manufacturing these ashes in Britain. On which subject he has the following observations.—

“The blue and white pearl-ashes we have discovered to be pure alkaline salts, without any considerable mixture of heterogeneous bodies. Their purity shows the lixive to have been strained through some close substance, such as linen or flannel. The blue ashes show by their colour that they have sustained the most fire. But both of them are so much alike, that the one may be substituted for the other; and therefore we shall consider them in one view.

“Every one knows that alkaline salts, such as these, are got from all plants except the alkalescent, and from all trees except the most resinous, which afford them in very small quantity. These plants or trees, when found, are pulled or felled in the spring, dried, and burnt to ashes. By the affusion of warm water the salts are dissolved, and, by straining, separated from the earth along with the water. This saline liquor, which is called a *lixive*, is evaporated over a fire; and what remains is an alkaline salt of the same kind with the pearl-ashes.

“I was informed by a skilful bleacher in Ireland, that he practised a more expeditious way of extracting the salts. He bought the ashes of different vegetables from the commonalty for 9 s. a bushel. From these a very strong lye was made, into which dry straw was dipped until it sucked up all the lye. This straw was afterwards dried and burnt, and gave him salts which he showed me, almost as good and pure as the pearl-ashes. This method I have several times tried; but could never burn the straw to white ashes, the salts diminishing the inflammability of the straw. It is a very expeditious method if it can be practised. But I can see no occasion for bringing the lye into a solid form, as the salts must again be dissolved in water before they can be used. The strength of the lye can easily be determined by the hydrostatical balance.

“Though I make no question, that the quantity of salt, in plants of the same species, will vary in different soils and climates; yet it would be of advantage to have the proportion ascertained in general. Some trials of this kind I have made.

“Two pounds of fern which had been pulled August 16. were dried, and burnt to white ashes. These weighed 7 dr. and tasted very salt. When lixiviated, strained, and evaporated, they gave me 49 gr. of salt, about the eighth part of the ashes. If the fern had been pulled in April, it would have afforded more salt. Why then should we not prepare salts from this vegetable? There is more of it growing on our hills than would serve all our bleachfields. The Irish make great use of it.

“From 11 oz. of tobacco-ashes I had 1 oz. of salt. Two ounces of peat-ashes afforded half a drachm of

salt. Nettles, I am informed, afford much salt. Furz and broom, natives of this country, are very fit for this purpose.

“But the kelp, as it grows in such plenty along our shore, and contains more salt than any other vegetable I know, would be the most proper, were it not for a mixture of some substance that renders it unfit for bleaching, at least of fine cloths, after they have obtained a tolerable degree of whiteness. It is observed by bleachers, that, in these circumstances, it leaves a great yellowness in the linen. As these ashes are much used in Ireland, and as it is not uncommon to bleach coarse cloths with them in Scotland, a disquisition into their nature, and some attempts to purify them, may not be improper. There are no ashes sold so cheap as these; for the best gives but 2 l. the 2000 weight (B). They may, therefore, allow of more labour to be expended on them, and come cheaper at long-run than the foreign salts.

“I dried some sea-ware, and burnt it, though I found that last operation very difficult. When I had kept it fused in the fire for two hours, it weighed $3\frac{1}{2}$ oz. I poured on the ashes an English pint and a half of cold water, that I might have as little of the sulphur as possible. This lye, after it had stood for some hours, was poured off clear, and had but a slight tendency to a green colour. I made a second infusion with milk-warm water, and poured it off from the sediment. This had a darker colour than the former; was kept separated from it, and evaporated by itself. There was a third infusion made; but having no salt taste, it was thrown away. The second infusion seemed to contain more sulphur than the first; and a piece of white linen kept in it half an hour, while it was boiling, was tinged yellow, and could not be washed white again. The earthy part remaining, weighed, when well dried, 1 oz. 2 dr. The saline decoction evaporated by degrees, and set at different times in a cellar to crystallize, afforded me 5 dr. 46 gr. The liquor, when entirely evaporated, left $4\frac{1}{2}$ dr. of a yellow salt, which appeared to be a strong alkaline. The salts which crystallized seemed to be mostly sea-salt, with a considerable quantity of sulphur, and some alkaline salt. There appeared no signs of the bittern in these salts, as their solution did not turn turbid with the oil of tartar. Nor is any of the bittern to be expected in kelp ashes, although it probably is to be found in the recent vegetable; because the alkaline salts formed by the fire must have changed it into a neutral. The lye made warm with water, being evaporated, left 4 dr. of a black bitter salt, which, from its quantity of sulphur, appeared unfit for bleaching. These ashes, then, seem to be a composition of somewhat less than the fourth of sulphur, the same quantity of sea-salt, about a fourth of alkaline salt, and somewhat more than a fourth of earth. The alkaline salt contained in kelp-ashes amounts to one penny a pound. This cheapness makes it worth our pains to bestow some labour on them.

“If the bad effects in bleaching with kelp-ashes arise from

(B) “Since this treatise was written, however, the price of kelp has been advanced to 7 l. or upwards the 2000 weight; so that those who would now attempt any thing of this kind, must also manufacture the kelp themselves.”

Potash.

from the sea-salt, as some of the most knowing bleachers think, they can be freed from it in an easy manner. Let a lixive of kelp-ashes be made with cold water, for that does not extract so much of the sulphur; it must stand but for a short time, for these salts dissolve easily; decant it, and evaporate the lye. As the boiling continues, the sea-salt will crystallize. When that is all separated, the remaining lye will contain alkaline salt with some sulphur. This operation every master of a bleachfield may learn and oversee, without taking up much of his time. A similar process is carried on by common servants in the alum-works who have by practice learned it from others.

"I had some hopes that the sulphur might be carried off by long roasting, such as these salts undergo before they are fused in order to be turned into glass; because I had observed, that the longer time they were kept in the fire, the freer were they from this sulphureous part.

"I ordered a quantity of kelp ashes to be kept in the furnace of a glasshouse, where the heat was just below the vitrifying point, for 24 hours. During this time they had lost almost four-fifths of their weight. They were now much freer from their sulphur, and were of a light colour; but much of the alkaline salt had been driven off with the oils. If a lye is much impregnated with this sulphureous matter, it appears to be carried off in a great measure by long boiling.

"We come now to explain the method of manufacturing the white Muscovy ashes. We have shown, by undoubted experiments, that the greatest part of these ashes consists of lime; and yet we have several acts of parliament which forbid the use of that material under severe penalties. The parliament were in the right to discharge its use, upon the disadvantageous reports which were made to them. We shall immediately see how dangerous a material it is when used improperly, or without the mixture of alkaline salts, which render it safe, and more soluble in water. But I will venture to say, that experiment will not support the prejudice entertained with regard to it, if carried any further.

"Since bleaching, then, cannot be carried on without it (for those ashes which contain it are quite necessary in that operation), and since we import them from foreign countries, let these prejudices against it cease, and let us only consider how we may render our own lime as safe as the foreign. If we can do that, the wisdom of the legislature will be as ready to abrogate these acts as they were to make them.

"By my experiments on the white Muscovy ashes, I got about the eighth part of alkaline salts from them. This made me expect, that, by mixing in the same proportion quicklime and alkaline salts, I should be able to produce Muscovy ashes.

"To an ounce of quicklime and a drachm of white pearl ashes, I added about a gill of water, and boiled them together till the water was all evaporated. The taste of this substance was little different from lime. To recover the salts again from the lime, I dissolved it in water strained off the liquor, and evaporated it. Instead of the drachm of salts, I had but 2 gr. of a substance which was more earthy than saline.

"To 3 dr. of quicklime and as much potashes, I added a pint of water, and kept it boiling for two

VOL. XV.

hours till it was evaporated. I dissolved it again in water, which being filtered and evaporated, gave me 1½ dr. of a caustic salt, that liquefied in the air when it had been but four minutes from the fire. It appears, then, that the alkaline salts are destroyed by lime, and that a great part of them can never be again recovered. From the remaining lime, after the salts were extracted, I got strong lime-water, but without a pellicle. This shows, that a quantity of alkaline salts, equal to the lime, boiled with it for two hours, are not able to fix all the soluble part of the lime.

"From these experiments we may draw some corollaries with regard to the present subject. 1st, That evaporating the water from the lime and salts by boiling, is a most unfrugal way of preparing these white ashes. 2^{dly}, That these ashes ought to be kept close shut up in casks; for if exposed to the open air, though in a room, the alternate moisture and drought must fix their most useful parts. This I have found to be fact: for the salts that I made became less pungent by keeping; and I have observed, that the surface of the Muscovy ashes lost all pungency by being exposed to the air, while their internal parts still retained it. 3^{dly}, That all boiling is prejudicial to these Muscovy ashes, as it fixes, and that quickly, their most subtle and probably their most serviceable parts.

"Let us now proceed to another method of making these white ashes. I imagined, that if the salts were dissolved in water, and the quicklime slacked with that, the mass would soon dry without the assistance of fire. In this way I added equal parts of both; but the composition was so strong, that it blistered my tongue if it but touched it. When the fourth part was alkaline salt, it blistered my tongue when kept to it a few seconds. I could taste the salts plainly in the composition, when they made but the thirty-second part of the whole.

"I thought, when composed with the eighteenth part of salt, it had, when fresh made, just the taste and look of the Muscovy ashes; nor could any person have distinguished them. This I once imagined was the proportion; but when I found that the saline pungency soon turned weaker by keeping, and that this composition would not afford the same quantity of salts that the Muscovy ashes did, I saw that a much greater quantity of salts was necessary. The proportion appears to be one of salt to four of lime, prepared in this last way. Three drachms of ashes prepared in this way, and kept for a fortnight, gave me but 15 grains of salt; which is but the half of what the Muscovy would have afforded. I find, if the quicklime is first quenched, it does not fix the salts so much; and therefore is better and cheaper. One drachm of potashes dissolved in a little water, and added to 3 drachms of quenched lime, gave me 44 grains of a very caustic salt. I prefer this method as the best.

"The manufacturers of this salt probably pour the lixive upon the lime, as they can know by its specific gravity what quantity of salts is in the water, and so save themselves the expence of procuring the salts in a dry form.

"The manufacture of the Marcott and Cashub ashes remains yet to be explained. We have discovered that both of them contain sulphur, earth alkaline salts, and

3 I

lime;

Potash.

lime; and differ in nothing but in the Cashub's having more sulphur than the Marcott ashes. We shall therefore consider them together.

Whether these two species of ashes are of any use in bleaching, may be, and has already been, disputed. I find they contain no other principles, the sulphureous part excepted, than the former ashes combined together. Why then should we expect any other effects from the same ingredients in the Marcott and Cashub ashes, than what we have from either of the pearl and Muscovy ashes mixed together? The sulphureous principle in the former, must have very bad effects; as I find by experiment, that it leaves a yellowness on cloth that is very hard to be washed out. It is owing to this sulphureous principle that linen, after it has been washed with soap, and is pretty well advanced in whiteness, is apt to be discoloured by lye which is brought to boil: for, by boiling, the sulphureous part is extracted from these ashes, and the lye becomes of a deep brown colour. Daily practice, then, shows the disadvantage of this sulphureous principle. Besides, as sulphur unites itself quickly and firmly with alkaline salts, it must weaken or altogether destroy a great quantity of these in the Marcott and Cashub ashes, and so render them of no effect in bleaching. These two reasons seem to me sufficient to exclude them from the bleachfield; especially as, by increasing the other materials, we can attain perhaps more speedily the same end.

“ However, as custom has introduced them into general practice, we shall consider how they are to be manufactured. Dr Mitchel, has, in a very ingenious and useful paper, contained in the Philosophical Transactions for the year 1748, delivered an account transmitted to him by Dr Linnæus of the method of making potashes in Sweden. This account was contained in an academical dissertation of one Lundmark upon this subject at Aboe in Sweden. The substance of this account is, ‘ That birch or alder is burnt by a slow fire to ashes, and made into a paste with water. This paste is plastered over a row of green pine or fir logs. Above that is laid transversely another row of the same; and that likewise is plastered over. In this way they continue building and plastering till the pile be of a considerable height. This pile is set on fire; and whenever the ashes begin to run, it is overturned, and the melted ashes are beat with flexible sticks, so that the ashes incrust the logs of wood, and become as hard as stone.’ This, in the Doctor's opinion, is the method of making the potashes that come from Sweden, Russia, and Dantzic: and that there is no other difference betwixt the ashes made in those different countries, but that the Russian, containing more salt, must be made into a paste with a strong lye.

“ There would appear, by my experiments, a greater difference than this betwixt the Swedish ashes, if that is the true process, and those I have examined. I had discovered the greatest part of the Muscovy ashes to be lime. I suspected it might enter into the composition of the Marcott and Cashub; and have accordingly discovered it there. Without the same grounds, none would ever have searched for it. Whence then comes this lime? It must either enter into its composition, or arise from the materials managed according as the process directs.

“ I have tried the birch ashes made into paste with water. I have tried common charcoal made into a paste with a third part of potashes, and kept them in a strong reverberatory heat for some hours, and yet no such caustic substance appeared. I have kept earth and salts of kelp-ashes fused together for 24 hours in the furnace of a glasshouse, where the heat was just below the degree of vitrification; and yet no remarkable causticity appeared afterwards in the concretioned mass. But supposing that there did, will ever this account for the generation of lime? These chemists do not assert that it is a calcareous causticity. The earth of vegetables kept in fusion with their salts, is so far from turning into a quicklime, that the mass takes the opposite course, and becomes glass. Bodies that, by the laws of nature, are vitrescible, can never, so far as we know, become calcareous. In one or other of these two substances all bodies terminate that are changeable by fire; and vegetables are of the former kind. Here it may be asked, Why then, since they endure such a fire, are they not vitrified? the objection would be just, did they contain nothing else but what was found in vegetables. But if we once allow that lime is one of the materials, the difficulty is easily solved: for lime, we know, in proportion as it is mixed, hinders the vitrification of all bodies. In effect, the earthy part in these ashes is almost vitrified: and I think that I have carried the vitrification yet farther in that part; but I never was able, with the utmost heat of a reverberatory furnace, continued for six hours, to produce any thing like a thorough vitrification in these ashes. The heat of the fire used in the process would seem to be very great; and must, if it were not very difficult, reduce them to glass. The invitrifiable nature of these salts, so far from being an objection, becomes a strong proof of my opinion.

“ These salts have a remarkable pungency. This we have already seen is the natural effect of quicklime on salts.

“ These salts are found to be the fittest for making soap, and to incorporate soonest and best with oils. Salts, we know, of themselves do not readily unite with oil; but when once mixed with quicklime, they have a greater tendency to union.

“ Again, I find that these ashes are more easily fluxed than charcoal made into a paste with the third part salt; which is much more than the ashes contain. Now, it is observed that quicklime increases the fluxing power of alkaline salts; for the common caustic made of quicklime and alkaline salts is sooner fused than the latter alone.

“ From these reasons, and the experiments that discover lime in these ashes, I am led to think, that it is not generated by the process, but mixed with the ashes when they are made into a paste. The following experiment is a convincing proof of what I have been endeavouring to make out.

“ I boiled some pease-straw in a strong lye of pearl-ashes burnt into a black coal, and made it into a paste with water. Another quantity of straw was boiled in a lye made of one part of quicklime and four parts of pearl salts, the lye being poured off turbid from the lime. This straw was likewise burnt when dry, and made into a paste. These two substances were put in-

Potash.

to

¹ Potash. to separate crucibles, and fluxed in a reverberatory furnace. The latter appeared to resemble the Marcott and Calhub ashes more than the former, which seemed to want their pungency."

¹² Potashes and pearl-ashes obtained from neutral salts.

Though the only method of preparing the alkaline salt originally is by the combustion of vegetables, yet there are some neutral salts from which if it were possible to expel the acid, we should have it in our power to procure the finest pearl-ashes in vast quantity. These are vitriolated tartar, nitre, but especially sea-salt, on account of the inexhaustible quantities of it to be met with in the waters of the ocean. Unhappily, however, there are some objections to every one of those. The vitriolated tartar, or any other salt in which the vitriolic acid enters, cannot be decomposed without converting the acid into sulphur by charcoal-dust; in which case it is as difficult to get free of the sulphur as of the acid; and if we attempt it by frequent solutions in water, we destroy the phlogiston of the sulphur, and have only vitriolated tartar again instead of alkali.

See CHEMISTRY, n° 716, &c.

With respect to nitre, though its acid may be expelled by fire, yet it is too high-priced, and too much used in other manufactures, to be thought of for this purpose. A potash manufacture from sea-salt has indeed been lately erected in England. The principle on which this was established is, that the acid of sea-salt may be extracted by means of lime; and accordingly we find that the saline efflorescence, which frequently appears on walls, consists chiefly of the marine alkali deprived of its acid. But this, though delivered on the credit of a very eminent chemist, we can affirm from our own observation to be a mistake. Of the many cases in which we have examined this efflorescence only one was found to be alkaline; the others uniformly appeared to be true Glauber's salt composed of the vitriolic acid and fossil alkali. Neither did this appear to be formed by any decomposition of salt originally in the plaster, but to be a real generation of both acid and alkali where none of them existed before. See EFFLORESCENCE.

POTATO, in botany. See SOLANUM.

¹ How potatoes were introduced into Britain.

Potatoes, it is generally thought, came originally from North America, where they were not reckoned good for food. They were first (we are told) introduced into Ireland in the year 1565, and from thence into England by a vessel wrecked on the western coast, called *North Meols*, in Lancashire, a place and soil even now famous for producing this vegetable in great perfection. It was 40 years after their introduction, however, before they were much cultivated about London; and then they were considered as rarities, without any conception of the utility that might arise from bringing them into common use. At this time they were distinguished from the Spanish by the name of *Virginia potatoes*, or *battatas*, which is the Indian name of the Spanish * fort. At a meeting of the Royal Society, March 18th, 1662-3, a letter was read from Mr Buckland, a Somerset gentleman, recommending the planting of potatoes in all parts of the kingdom to prevent famine. This was referred to a committee; and, in consequence of their report, Mr Buckland had the thanks of the society, such members as had lands were intreated to plant them, and Mr Evelyn was desired to mention the proposals at the close of his *Sylva*.

* See Convolvulus, n° 5.

In Sweden, notwithstanding the indelible industry of Linnæus, the culture of potatoes was only introduced in 1764, when a royal edict was published to encourage their general cultivation. They were known there, however, at an earlier period; for in the *Memoirs of the Royal Academy of Sciences in Sweden*, 1747, M. Charles Skytfe proposed to distil brandy from them, in order to save corn, which in that country is very dear. He found by experience, that an acre of land set with potatoes will yield a much greater quantity of brandy than when sown with barley.

Potatoe.
² Their late introduction into Sweden.

The utility of potatoes to the common people is well known, and this utility has brought them into general use, and has extended them over every part of this country. To promote this utility, and to make their cultivation more easy, a variety of experiments and inquiries have been made. Some of these we shall now lay before our readers, without repeating, however, what has been said on the same subject in the article AGRICULTURE, n° 158—167. By many people the Irish purple potato is thought to be the sweetest and best; and of these the bright and middle-sized are directed to be set whole, in February, March, and April, in a fine deep tilth, in any soil. During the frost, the first setting should be covered with litter or fern. They should be set six inches deep, and a yard distant from each other every way, in a kind of hillocks like a mole-cast; and they must be moulded every month or fortnight, as high as possible. By July or August, under each hillock there will be nearly a bushel of potatoes. The white kidney potato runs all into stringy roots in loose ground, while the pink-coloured will do extremely well in the way we have now directed; and the smallest of them, though often given to hogs, unless they be otherwise improper or unhealthy, will be very good feed.

³ Their great utility.

⁴ Remarks and experiments on their culture.

The following experiments concerning the culture of potatoes are related in the *Georgical Essays*.

"By all the experiments that have been made, the Howard or large Bedfordshire potato is found to produce the largest crop. On that account they are chiefly used in feeding of cattle. In two beds, four feet wide, and 200 feet long, I planted in a common field a sufficient number of sets of this kind of potato, and managed them by a horse-hoe. The produce was 64 bushels, each bushel up-heaped, weighing about 70 lb. My cattle eat them boiled with as much eagerness as the best sorts, and came on as well with them. I have built a boiling-house, &c. on Mr Young's plan, and during this whole winter have boiled potatoes for my cattle. For the fattening ones, I mix ground oats with them; and for the milk-cows, malt-dust; and dare venture to affirm, that they are much more profitable than either turnips or cabbages. Once, when my potatoes grew low, I desisted giving them to the milking-cows. Immediately, though fed with the best hay, they fell off amazingly in their milk. I therefore began again; and in a week's time they gave better than one-third more butter. I own this accidental discovery gave me much satisfaction, as it confirmed my opinion, that potatoes boiled are an excellent winter food for cattle. Their culture is not so difficult, at least not so precarious, as either turnips or cabbages. Their value is superior, and there is no risk of their giving a disagreeable taste either to butter or milk.

⁵ Of the Howard potato.

Potato.

6
Of the in-
crease of
potatoes.

milk. Add to this the vast increase of the Howard potato, and its equality with the best sorts when used for cattle.

"My gardner cut a large potato into nine pieces, which he planted with dung, in a drill, in the garden. By earthing up and laying the shoots, he produced 575 (A) sizeable potatoes, which weighed eight stone eight pound. Another of my servants produced, in the field, seven stone of good potatoes from the same number of sets. Though this experiment cannot always be executed in its full force in an extensive scale, it ought, notwithstanding, to be imitated as nearly as circumstances will allow. It shows, in the most distinguishing manner, the use of clean and careful husbandry.

"On the 14th of April, I cut a large white potato into 17 sets, which were planted in as many hillocks, at the distance of four feet. In the course of growing, the plants were earthed up, and on the 14th of October the crop was taken up: The produce, 10 pecks of sizeable potatoes. At the time that this experiment was made, I had several hillocks, in which I put three and four sets of the same kind of potato. But, upon the most careful examination, I could not observe that these hillocks produced a greater crop than the others planted with a single set. Hence it is obvious, that the potato spreads its root most kindly when least crowded."

While speaking of the increase of potatoes, we cannot help taking notice of a memoir by John Howard, Esq; of Cardington, in Bedfordshire, on a new kind of potato remarkable for its prolificacy. "In the year 1765 (says he) being at Clifton, near Bristol, I was informed a person had brought from America a new sort of potato, and with some trouble I procured half a dozen roots of it, as the greatest part of those brought over were already planted. That autumn I planted three of them, and in the following spring the other three, in my garden at Cardington in Bedfordshire; setting them in hillocks about six feet asunder. The strength of the stems, and largeness of the blossom and apples, gave the pleasing prospect of great increase: and accordingly, when I took them up in the autumn 1766, I found they had increased far beyond any of the common sort, which for some years I had encouraged our cottagers to cultivate. The produce from each cutting was in weight from 26 to 27 pounds and a half. I sent for two of the Bedford gardeners, who serve the market, to see them taken up, and they were surprised at the great increase. I gave some of them to these gardeners, and others to almost all our own cottagers. The increase continued to appear the same in the succeeding year, viz. 1767, as in the last: only, as many of the single potatoes had been then found to weigh four or five pounds each, I had now planted most of them in drills three feet asunder, in order to procure a greater number, and a less size. Their produce was now from 22 to 30 pounds from each cutting; and the potatoes were more

sizeable for common use. The vegetation was not so luxuriant as in those I before planted in hillocks; but the increase of these was, allowing the cuttings to weigh one ounce, full 400-fold. Having last year upwards of a waggon-load of these potatoes, I with pleasure ordered it to be made publicly known, that every person who chose to cultivate them were welcome to have a quantity for planting. In consequence of this, numbers applied in our own and the adjacent counties. In my plantations, as well as those of other persons, the increase has been still greater this year: for the season having proved very favourable, I have had from some hillocks 41 pounds and a half, allowing for dirt."

We now continue our extracts from the Geographical Essays.

"Take a bunch of the apples of any sort of potato. ⁷ Hang it up in a warm room during the winter, and in ^{Of raising} February separate the seeds from the pulp, by washing ^{seedling} the apples in water, and pressing them with the ^{potatoes.} fingers. Then dry the seeds upon paper. In the month of April, sow these seeds, in drills, in a bed of earth well dug, and manured with rotten dung. When the plants are about an inch high, draw a little earth up to them with a hoe, in order to lengthen their main roots. When they are about three inches high, dig them up with a spade, and separate them carefully from each other, in order for planting out in the following manner. Prepare a piece of fresh ground by trenching it well. Dig up the seedling plants as before directed; and plant them out in the ground, thus prepared, in such a manner that there shall be 16 inches between each plant. As they advance in growth, let them receive one or two earthings up, in order to lengthen the main root, and encourage the shoots under ground. By this management, the potatoes will, in the course of one season, arrive at the size of hen's eggs, and the haulm will be as vigorous as if sets had been planted. But what proves the luxuriance in the most convincing manner, is, that flowers and apples are produced.

"In Lancashire, where the gardeners raise potatoes from seed, they are always two, and sometimes three, years in bringing them to full size. By the above method of transplanting, with wide distances, many of the potatoes nearly attain their full size in one season. It is observable, that these seedlings produce potatoes of all the different kinds; and sometimes new sorts are procured. We do not find any difference whether the apple comes from one kind or another. It is not so when we use the set, which invariably produces the same kind. Potatoes, when propagated from sets, after a number of years, are found to decrease in bearing; for which reason they should be brought back every 14 years to their original. From a want of attention to this circumstance, I have known potatoes so run out, that they hardly returned treble feed. The farmer complains that his land is tired of them; but the true cause

(A) Instances of the amazing increase of potatoes are very numerous, and are almost every year detailed in the public papers. In the Gentleman's Magazine for 1757, p. 480, we are told, that from one slice of a potato, set in the spring of the same year by Mr Simon M'Hoy, a farmer at Park near Tuam in Ireland, there proceeded no less than 84 stalks, which produced 965 potatoes.

Potato. aise is the age of the sets. The increase of potatoes raised from seed is astonishing. They continue in vigour for about 14 years; after which the produce gradually declines.

8 **On raising early potatoes.** "As the culture of potatoes, and particularly of the early sorts for the table, has of late become an object of very general attention, I hope the following account of a new method of obtaining these (without the help of hot-beds) will be acceptable to the public.

"On the 2d of January 1772, I made a hot-bed for the forward sort of potatoes, and on the 7th put in the sets, placing a glass and frame over them, and taking every precaution to defend them from the frost. Of these small potatoes, or sets, there remained about 40 in a basket, which was accidentally hung up in a warm kitchen, and there remained unnoticed till about the 25th of April. I then accidentally observed the basket, and perceiving something green on the edge of it, took it down, and, to my great surprise, found that the potatoes had sprouted half a yard in length, and that there were a great number of very small potatoes formed on the fibrous roots which had grown out. I took them into my garden, and planted them in a rich sandy soil, without any manure. The roots I put into the ground three inches deep, and laid down the stems that had sprouted, horizontally, and covered them with two inches of soil, but left the tops uncovered. Without further attention they grew surprisngly.

"On the 26th of May, I took up the roots planted in the hot-bed on the 7th of January. They by no means answered my expectations, or paid for the trouble of their culture: but, at the same time, I was astonished to find the others, which were put into the ground so late, to have produced larger potatoes than the roots in the hot-bed. I took up all the roots, and picked off the large potatoes from them, which amounted to from 4 to 12 on each root, and then set the roots again in the same ground. This, indeed, I have successfully practised for many years, sometimes even twice, and have had a third good crop at Michaelmas. When this method is tried, the roots must be watered on the evenings of hot days.

"In January 1773, in order to make a second trial of this experiment with a large quantity, I placed a great many potatoes of the early sorts on a thick layer of gravelly soil, close to each other, over an oven, slated over, but open to the south-west, and covered them two inches deep with the same earth. At the end of April I took them up, and found the stems about a foot long or more. For fear of injuring the fine and delicate fibres of the roots, I took great care in taking them up, and planting them in the soil. This I now manured, but in all other respects treated them in the manner above described, many of the fibrous roots having then potatoes formed upon them nearly as large as walnuts. For a week, the plants came on surprisngly, when, by one sharp night's uncommon frost, they were nearly destroyed. However, notwithstanding this, fresh stems grew up in a few days, and I actually gathered from them, on the 3d of June following, finer potatoes than were sold at that time, at Manchester, from 1 s. to 1 s. 6 d. per pound, being the produce of hot-beds. After taking off the larger potatoes, I again planted

the roots for a second crop, and in September obtained a very large produce. I weighed the increase of many separate roots, which amounted from four pound eight ounces to 14 pound 12 ounces, the potatoes being the largest of the forward kinds I ever saw.

"Make a compost of earth, sand, and coal-ashes. With this mixture fill a tub about 16 inches deep. Plant this artificial soil with some sets of the early round potato, and place the tub in a stable opposite to a window, taking care to water the earth now and then. In all seasons the sets will sprout, and give a tolerable increase of potatoes. Last November I planted some sets in the above manner; and in February following I took up a considerable number of young potatoes, clean skinned and well flavoured.

9 **On raising them in winter.** "On the 18th of May 1772, finding some beds I had sown very early with onions to be a missing crop, I was induced to make the following experiment. The year before, I had set some potatoes in another part of my garden in the common way; and as it is impossible but some will remain in the ground all winter, so I found a number of sprouts about three inches high, which I nipped off close to the ground, and transplanted them into the onion-beds, without any further preparation, about a foot and a half asunder, in the same manner that cabbages and cauliflowers are planted. As the season became immediately very dry, I was obliged to give my plants a little water for four or five successive nights; after which they began to flourish, and had the appearance of a promising crop during all the summer. At the usual time, in October, I ordered them to be taken up; and for size, quantity, and quality, they exceeded all I ever had in the common way. Had the ground been fresh, properly manured and prepared, and the plants put down at a proper distance from each other, I am of opinion that the success would have been still greater.

10 **On trans-planting potatoes.** "From an accurate experiment made last year, I dare venture to recommend baked potatoes as an excellent food for hogs. The pork produced by this food was equal to that from barley and beans: but at present I cannot exactly ascertain the comparative experiment with regard to expence; however, I am of opinion, that roasted potatoes, considering the improvement of the hogs, is as cheap a food, if not cheaper, than can be given them. I roasted my potatoes upon a kiln, similar to what is used by oatmeal shellers for drying their oats. The difference in expence between boiling and roasting the potatoes is prodigious, both with regard to the labour and fuel. A kiln that will cost 3 l. will roast potatoes sufficient for the maintenance of more than 20 hogs; and one man will bestow all the necessary attendance upon them, and do other work besides. The action of the fire, by dissipating the crude juices that are contained in raw potatoes, reduces them into a state highly wholesome and nutritious. Boiling does this in part, but not so effectually. A potato roasted in the manner above described, partakes much of the nature of a chestnut, and perhaps is not greatly inferior to it."

Potatoes are found to be useful food for most other animals. See AGRICULTURE, n° 45.

To these experiments we shall add some important observations of Dr Anderson of Cotesfield near Leith, who

Potato.
12
Remarks
on the
seeds most
proper to
be planted.

who has paid a very particular attention to this as well as other branches of agriculture. Our readers will find the Doctor's remarks and experiments at large in the *Bath Papers*, volume fourth. He first considers the nature of the seeds most proper to be planted; and from his experiments he thinks it appears that the produce is not materially affected, by planting for seed, either whole potatoes or cuttings, or large or small potatoes as such; for it is only incidentally that these things can affect the crop. In the fifth volume of the *Bath Papers*, Mr Wimpey relates an experiment, by which it would appear that there is an advantage in planting cut potatoes. His conclusion is as follows. "The measure of all the ground planted, says he, was 325 poles; the whole produce 378 bushels. The measure of the ground planted with cut potatoes was 265 poles; the produce 312 bushels. The ground planted with whole or uncut sets was 66 poles, and the produce of the same 66 bushels. Now, if 48 bushels, the whole quantity of sets used, produced 378 bushels, then 34 bushels, the quantity cut, should produce 267 bushels; but they produced 312, which is 45 bushels more than the proportion. Again, if 48 bushels produced 378 bushels, then 14 bushels should have produced 110 bushels; but 14 bushels of uncut produced only 66 bushels, which is 44 bushels less than the proportion. A preference of 40 per cent. in favour of cut potatoes, in comparison with whole sets." Mr Wimpey corroborates the fact in the sixth volume of the same work, and informs us, moreover, that he used to supply many of his neighbours with potatoes for planting; some of whom desired to have them all small as they had found them equally productive with the larger, and saved much trouble in cutting. "Others (continues he) preferred the largest, who carried their economy much further: they, it seems, used to pare them, eat the fleshy part, and plant the rinds only. Upon inquiry, I found it was not an unusual practice among the cottagers; and I have been credibly informed they get as large crops and as good potatoes in that method of planting as in any other whatever. If this be a fact, it seems to appear that the fleshy part of the bulb is of no use in supplying nourishment to the young fruit after the fibrous roots have put forth and laid hold of the ground. Perhaps an experiment of this sort may be thought worth making. "The weight of the crop, however, Dr Anderson asserts (and Mr Wimpey agrees with him, see *Bath Papers*, vol. v. p. 34.), is always in some measure influenced by the weight of the seeds planted; but the weight of produce is not augmented in the same proportion with the weight of the seed planted; the smallest seed yielding the greatest returns in proportion to the seed, but the smallest in proportion to the extent of ground. It is in no case profitable, however, the Doctor thinks to plant small potatoes (B), or small cuttings, unless where it is meant to increase

as fast as possible a favourite kind; in which case it may be sometimes eligible to plant pieces very small, as in that way the kind will be most quickly multiplied. We may also remark here, that such as wish for a large increase should never plant the worst of the crop; it is, we know, extremely common, and may indeed be an immediate saving; but it is unquestionably a loss upon the whole; and perhaps it is one cause of the *curl disease*, which is the sure indication of a poor dwindling crop, and of which we shall speak more at large immediately.

Our author further remarks, that there seems to be no reason to suspect that eyes taken from any particular part of the bulb are possessed of a degree of prolificacy greater than those taken from any other part of it, independent of the size of the fleshy part that adheres to the eye. It is however highly probable that a difference in the crop, either with respect to the number and size, or general weight of the whole, would result from planting large cuttings of equal weight, taken from the big end of large potatoes, or from the point, as many eyes would be in the last in comparison of the first. This is therefore one of the many preparatory experiments that require to be made: It is possible too that even the apples may be an object of value, and may indicate a thriving crop or otherwise; but of this there is no certainty, as no specific experiments have yet been made on this subject.

With respect to the effects of cutting the stems of potatoes while growing, the Doctor seems to be doubtful. The stems of potatoes, if cut while growing, and used green, are found to be a wholesome food for cattle, and horses. But though some farmers maintain that the produce in potatoes is not lessened by having the stems cut off while they are in state of vigorous vegetation; others as positively insist that the crop is essentially injured by that operation. It is proper that this point should be ascertained. Probably the crop is hurt if the stems are cut over before they have attained a certain point of maturity, though it is possible they may be afterwards cut without doing any essential injury to it.

We have already mentioned that an experiment was made a good while ago in Sweden, to extract ardent spirits from potatoes. Other experiments have been made in this country of a later date, but with little effect. This, however, appears to have proceeded either from ignorance or a want of proper attention to the fermentation and after-distillation; as appears from Dr Anderson's experiment, which succeeded extremely well by attending to these processes. What he made he asserts to have been the finest and most agreeable vinous spirit he ever saw, resembling in taste very fine brandy, but more mild, and having a certain coolness on the stomach peculiar to itself.

Much may be done in bringing potatoes to perfection

(B) In opposition to this, it is the opinion of even practical men, that the small potatoes are to be preferred. "I have been informed (says Mr Hollins) by a native of America, that what we call the long red American potato, grows in that rich and newly-cleared soil to a very large size; but that the potatoes proceeding from the roots were never used as seed; for there sprung from the stalk, very near the surface of the ground, small potatoes as they called them; but, he said, they were about the size of those raised in England, and those were always planted. I hope the Society will forgive my mentioning this, as it confirms what I have already said, 'that small potatoes are best for seed.' *London Society of Arts*, vol. xi. p. 82.

Potato.

15
On attending to the several varieties of potatoes.

tion by attending to their several varieties. For this purpose some particular potato must be fixed upon as a standard; and when this is done, the inquiry must be carried on by attending, *first*, to their appearances below ground, as, 1. the general form and size of the bulbs; 2. their colour; 3. the smoothness or roughness of the skin; 4. the consistence, that is, the mealiness or viscosity and taste of the bulb; 5. the colour, length, thickness, &c. of the umbilical cord; 6. their tendency to grow deep, or to rise near the surface; to ramble wide, or to adhere close to the stem; 7. the time when the bulbs knot and set; marking, not by the kalendar only, but also compared with the advance of the plant above ground; 8. the time when they attain perfect maturity with respect to size, and also that period of their growth at which they lose the herbaceous, and attain the farinaceous, taste; 9. their general prolificacy; 10. how long they may be kept, at what season they are in greatest perfection for eating, &c. We must *next* attend to the particulars observable above-ground; as, 1. the general height, colour, and form of the stem; 2. their tendency to push out many or few stems from a root; 3. whether they carry blossom or not; 4. the form, dimensions, and colour of the leaves; 5. the form, colour, and general habitude of the blossom where there is any; 6. the time at which the blossom appears; 7. the tendency they have to produce few or many apples; 8. the tendency they have to produce those excrescences on the stalks that resemble potatoes below ground, which may be called air potatoes; 9. the comparative hardness or tenderness of the leaves, in respect of frost or other variations of weather that affect them. And, *lastly*, we must attend to the particulars that concern the whole plant; as, 1. the soil which seems best to suit each kind; 2. the mode of culture that best agrees with them; 3. the accidents which are most liable to affect them; and in general every particular that could indicate any difference between one kind and another.

16
Opinions on raising seedling potatoes.

Our author next considers the circumstance of raising seedling potatoes. His mode of raising them was similar to that recommended in the *Georgical Essays* quoted above; but he differs with respect to the utility or success of that mode. It has been alleged, he says, that potatoes, which have been long propagated by means of bulbs, lose in time their generative quality, so as to become much less prolific than at first; and it is asserted that those bulbs which have been lately obtained from seeds are much more prolific, and consequently much more profitable for being employed as plants than others: but this opinion appears to have been adopted without sufficient examination: for there appears not the smallest indication of superior prolificacy in those raised from seeds, but rather the reverse. That potatoes do not degenerate in point of prolificacy in consequence of being long propagated in the usual way, seems to be confirmed by the general experience of all Europe. It is now about a hundred years since the potato was pretty generally cultivated in Ireland, and it has been very universally cultivated in Britain for

50 years past; and all that have been reared in it since their first introduction two hundred years ago, a very few or late only excepted, have been propagated from bulbs only; so that if they have declined in point of prolificacy, the degeneracy should in this time have been very apparent. Nothing of that kind however was ever remarked, nor any insinuation of that sort thrown out, till the discovery of rearing potatoes from seed was made, when it was for the first time heard of. There are many persons now living who have been in the constant practice of rearing potatoes for 30 or 40 years; and notwithstanding the general tendency that mankind have to dispraise the present, when compared to past times, yet none of them have given the smallest hint of degeneracy in this respect. And perhaps it will be found that this is merely a groundless notion, that has originated from the partial fondness of those who first propagated this plant from seed, in favour of their new discovery. It has been further said, that by raising potatoes from seed, many new and valuable kinds may be obtained; and it is also asserted in the *Georgical Essays*. Indeed an opinion of obtaining new varieties of plants by propagating them from seed universally prevails among naturalists. But Dr Anderson, in his first paper, doubts whether this be fact, and whether, when any of these occur, they have not been the effect of accidental position or other causes. We may certainly (says he) assert on the whole, that if the practice of rearing potatoes from seeds shall ever be productive of any advantages to society, they have not yet been discovered. Since he wrote that treatise which appears in the Bath Papers, vol. iv. (and of which we are now giving a short account), however, he has had occasion to alter his opinion, which he does with great candour, in vol. v. The experiment which induced him to alter his opinion, and which appears to be decisive, was made with the seed of a potato procured from Ireland of a very peculiar kind. Its colour was a dirty dark purple, its shape a round irregular bulb, and its stem tall and upright. The seeds procured from this potato were sown by themselves, and the seedlings when of a proper size were transplanted. From the appearance of the stems he soon discovered that they were not all of one sort, and on taking them up the variety was almost infinite; and such as could not be accounted for on the principles of a mongrel adulteration. The diversities respected colour, shape, &c. some of which he enumerates. See *Bath Papers*, vol. v. p. 127.; see also p. 35. where Mr Wimpey controverts the Doctor's former opinion.

Respecting the causes and prevention of the *curled* ¹⁷ *disease* in potatoes there has been a great variety of opinions, which we have detailed at some length under the article AGRICULTURE, p. 267 to 270. Dr Anderson confesses that he can say but little *positive* as to the cause of this disorder, but he thinks a good deal may be said on the *negative* side of the question. It was little known till lately (c), and in the northern parts of Britain it was absolutely unknown but a very few years ago; and even now in the more remote corners it is still less frequent than in the more southern and.

(c) In the eighth volume of the Transactions of the London Society for Encouragement of Arts, &c. p. 43. we are told that the curl first appeared in 1764, in the very district in Lancashire where they were first cultivated.

Potato.

and more commercial districts of the island. It has been supposed that nature, sated as it were by having long produced this plant in a climate not deemed congenial to it, had become so far exhausted as to occasion this disease. But in this case, the more northern parts, where the climate is most unfavourable, should have been soonest affected. It has been also thought that potatoes, whose bulbs are frost-bitten before they are housed, occasion this disease in the plants they produce. But the fact is, that they are least liable to the disease in those districts where they are most exposed to frost. A potato can never indeed be benefited by frost; but it is not at all probable that the being touched by it occasions the curl. The taking up potatoes before they arrive at maturity has been thought to occasion the disease; but in places where they must be taken up so, the disease is scarcely known. It has also been thought that potatoes obtained from *seed* are entirely free from it. But Dr Anderson gives a proof of the contrary; for one half of the plants of a large field planted from potatoes the third year from the seed were curled; while another field adjoining raised from potatoes that never were, that he knows, produced from seed in Britain, had scarcely one curled plant in the whole. The disease has been supposed by others to arise from the soil or season. But that this is not the case, appears from the circumstance of a single field which Dr Anderson planted with potatoes of the very same sort, but obtained from different persons. The ridges were intermixed, and the one was very much curled, and the other perfectly free. The disease, therefore, appears to arise from infected seed: it is however possible that it may be communicated by juxtaposition; and if so, the disease might be in a great measure if not entirely avoided, by pulling out those that showed the least symptom of it, on their first appearing above ground.

In the Transactions of the London Society for encouragement of arts, &c. we find a good deal about the curl disease. Many of the writers agree in opinion with Dr Anderson in many particulars; and particularly, that though the disease may be prevented, we do not yet know enough of its nature to be able to cure it. See their vol. viii. p. 18, &c. ix. p. 52, &c. and x. p. 75. In this last volume we are told that the principal causes of the curl are three: 1. From their being forced by cultivation to overgrow their power for vegetation; 2. From their vegetative power being dried up in ebb soil by the scorching heat of the sun; and, 3. From their being exposed too long after they are cut in sets before they are planted.

18
On the soil
and season
most pro-
per for po-
tatoes.

It is generally and very naturally believed that a dry soil or a dry season necessarily produces the driest potatoes. But there is good reason to doubt the truth of the opinion. The year 1775 was the driest and warmest season that has been known in Scotland within the memory of man, yet the potatoes of that year's crop were watery almost to a proverb: on the other hand, the potatoes of crop 1777, although it was a remarkably rainy season, were as dry and mealy at least

as is common, and much more so than in the year 1775. It deserves also to be remarked, that the crop of 1775 was almost double in quantity to that of 1777. Hence a dry season would seem to augment the produce, though it does not for certain in all cases improve the quality, of this crop: nor does a dry soil necessarily insure mealy potatoes; for our author says he has often seen potatoes of the same kind, and of the same year's produce, reared in two different places; the one of them in a naturally damp soil, which turned out to be much freer and more mealy than the others which were reared on a drier and sharper soil. He confesses, that he has also often seen it turn out in fact, that potatoes raised in those districts where the soil is hot and sandy, are usually more free and tender than those raised in countries where the soil is cold and damp. Our author tries to account for these contradictory phenomena by conjecturing the probable cause of the wateryness or dryness of a crop. He asks, Whether in this respect the crop is anywise affected by the degree of ripeness that the plants employed for seed may have attained in the preceding season? That this is the case he thinks highly probable. Potatoes which, on account of the richness or other peculiarity of the soil, continue in a state of vegetation highly luxuriant till they are nipped by frost, or checked in their growth by other inclemencies of the season, have much less chance of being dry and mealy than others of the same sort which have attained their full growth before the coldness or inclemency of the weather checked them. But our author's question does not relate to this, but to the effect these unripe potatoes, used as seed, would have on the succeeding crop; a circumstance which experience alone can determine. "But even if it should be found (continues our author) that the maturity of the seeds affected the quality of the potatoes, it would not follow invariably that the seeds produced on early dry soils would be better than those from later soils; because it might sometimes happen from local position, and other accidental circumstances, that the growth of the potatoes in the dry early soil might be checked by frosts many weeks before those on the other soil were affected, in consequence of which the plants in the cold soil might attain to more perfect maturity than those on the drier one. I mention this peculiarity merely to show how cautious the farmer ought to be in adopting general conclusions without carefully attending to all the collateral circumstances that may affect his experiment. I shall only farther add on this head, that I had occasion to know well a dry warm spot of ground on which the stems of the potatoes of crop 1776 were frost-bitten at least *six weeks* before those on another spot at some miles distance from it, where the soil was naturally more cold and damp, were in the smallest degree affected by it. It likewise so happened, that the potatoes raised on the first-mentioned spot in the year 1777 (their own frost-bitten (D) seed was employed) had such a peculiar acrid and bitterish taste as to be hardly at all eatable, while those in the colder place of that crop had nothing of that unusual

Potato.

(D) Observe, the term *frost bitten* is here applied to the stems only, and not to the bulbs. The stems were so much hurt by the frost as to turn black and decay, but the bulbs were taken up before the frost had been sufficiently intense to hurt them.

Potato.

usual taste. Whether this diversity was occasioned by the circumstance here alluded to, I do not take it on me to say. In matters of such nice disquisition as the present, many facts obtained by very accurate observation are necessary before any conclusion can be relied on."

Potatoes, when planted in water, shoot out a great number of fine white roots like threads into the water; but on none of them is there to be found the least appearance of a bulb; while on the other hand the potatoes in that case always grow on the top. Potatoes are found to be extremely useful in bringing exhausted land into heart again. See AGRICULTURE, n° 35 and 186, p. 309, col. 1. The bishop of Killaloe in Ireland directs the use of them for this purpose in a letter in the *Bath Papers*, vol. 4. p. 232, and confirms its utility in this respect by experiments of his own. In the 10th vol. of the *Transactions of the London Society for Encouragement of Arts, &c.* p. 34, there is also a most decisive proof of this utility.

We have been induced, from the extensive utility of this root, to extend our observations on the subject to a greater length than we should otherwise have done. Such of our readers as wish for further information, will of course consult the books from which we have made up the present article, as well as other books on Agriculture; in which they will find the observations and experiments which we have mentioned at much greater length than we could possibly give them. In the sixth volume of the *Bath Society Papers* there is an excellent paper on the culture of potatoes and feeding hogs with them during seven years by John Billingsley Esq; of which our limits do not permit us to take particular notice. There are also a variety of other papers in the several volumes of that work, as well as in the *Transactions of the London Society*, which we have already several times mentioned; which will deserve the particular attention of such as wish well to the poor, or have a desire still farther to extend the utility of this most valuable root. We have already mentioned a cheap preparation by means of potatoes for the poor, see AGRICULTURE, n° 161; and we shall finish the present article with a receipt to make a potato herrico, which may be equally useful to those whose circumstances are not such as to make them regardless of economy. We take it from the *Gentleman's Magazine*, and give it in the words of a person who had tried the experiment.

Scrape the skin clean off four pounds of good raw potatoes, then wash them clean in fair water: take two pounds of beef, one of mutton, and one of pork; or as you like best, four pounds of any of these meats; cut them into pieces of three or four ounces each, season them very well with pepper and salt and a good onion chopped very small: have ready a strong wide-mouthed stone-jar, such as hares are usually jugged in; slice thin a layer of the potatoes into the jar, then a layer of the seasoned meat over them, and so alternately layers of potatoes and meat; let your uppermost layer be potatoes, so that your jar be about three quarters full, but put no water into your jar; then close or stop the mouth of it with a large well-fitted piece of cork, covering the same with a strong piece of canvas, and tying it down with pack-thread, so as only a little of the steam may escape in the stewing; for a little should constantly evaporate from the side of the cork to save the jar from bursting. Then place your jar upright in a kettle of

Vol. XV.

cold water on the fire, so as the mouth of the jar may be always two inches above the water in the kettle when boiling. The herrico in the jar will begin to boil some minutes sooner than the water in the kettle, and that for obvious reasons. In about an hour after the water in the kettle begins to boil, your herrico will be fully stewed. Then take out and open the jar, pour out the herrico into a deep dish, and serve it up.

This excellent, wholesome, and economical dish supplies an agreeable dinner twice a week to a family consisting of three grown people, and three children under fourteen years of age, where neither health nor good stomachs are wanting, thanks to God: and, in point of economy we must observe, that here is the whole article of butter saved, as also the whole article of bread, or nearly so; nor does there require so large or so continued a fire, nor so much time or trouble as is necessary for the dressing of many other dishes that by no means deserve the preference of this excellent herrico.

We have also (by way of change) made it with powdered beef, sometimes with powdered pork, sometimes with half fresh beef or mutton and half pickled pork, and found it good in all these ways, particularly with three pounds of fresh beef and one of pickled pork. We have left off sending pies and stews to the bakers. We sometimes (in a larger kettle) boil a small piece of powdered beef along-side of the jar, by continuing the boiling an hour and an half longer, and this serves us to eat cold the next day, with hot garden-stuff or a pudding.

POTATO-Bread. See BREAD of Potatoes.

Spanish POTATO. See CONVULVULUS, n° 5.

POTENT, or POTENCE, in heraldry, a term for a kind of cross, whose ends all terminate like the head of a crutch. It is otherwise called the *Jerusalem cross*, and is represented Plate CCXXIX, fig. 12, 12.

POTENTIA (POWER), that whereby a thing is capable either of acting or being acted upon.

POTENTIAL, in the schools, is used to denote and distinguish a kind of qualities, which are supposed to exist in the body *in potentia* only; by which they are capable in some measure of affecting and impressing on us the ideas of such qualities, though not actually inherent in themselves; in which sense we say, potential heat, potential cold, &c.

POTENTIAL Caustery, in medicine, denotes the consuming, or reducing to an eschar, any part of the human body by a caustic alkaline or metallic salt, &c. instead of a red-hot iron, which last is called the *actual caustery*.

POTENTIAL, in grammar, an epithet applied to one of the moods of verbs. The potential is the same in form with the subjunctive, and is, according to Ruddiman, implied in that mood, for which reason that grammarian rejects it; but others will have it to differ from the subjunctive in this, that it always implies in it either *possum*, *volo*, or *debeo*. It is sometimes called the *permissive mood*, because it often implies a permission or concession to do a thing. See GRAMMAR.

POTENTILLA, SILVER-WEED, *wild tansey*, or *cinquefoil*: A genus of the pentagynia order, belonging to the icofandria class of plants; and in the natural method ranking under the 35th order, *Scuticoseæ*. The calyx is decemfid; there are five petals; the seeds roundish, naked, and affixed to a small dry receptacle. The species are, 1. The fruticosa, or shrubby potentilla, com-

3 K

monly

Potato
Potentilla.

Potentilla,
Poterium.

Poterium
||
Potosi.

monly called *shrub-cinquefoil*. This rises with a short shrubby stem, dividing into a branchy full head, three or four feet high; closely garnished with pinnated leaves of five oblong, narrow, acute-pointed, folioles, pale green above, and whitish underneath; and the branches terminated by clusters of large spreading, yellow flowers. This is a beautiful deciduous flowering shrub, worthy a place in every curious collection. It grows wild in Yorkshire and other northern parts of England, &c. but has been long cultivated in gardens as an ornamental shrub. 2. The reptans, or creeping common five-leaved potentilla, or five-leaved grafs, hath a thick fibry root, slender, trailing, repent stalks, digitated, five-lobed, petiolated leaves, and yellow flowers singly. 3. The rupestris, or mountain upright cinquefoil, hath upright stalks, eight or nine inches high; pinnated five and three lobed alternate leaves, having oval crenated lobes, and the stalks terminated by small white flowers. 4. The recta, or erect seven-lobed yellow cinquefoil, hath erect stalks, seven-lobed leaves; having three lobes spear-shaped and ferrated, green and hairy on both sides, and the stalks terminated by corymbose clusters of yellow flowers. 5. The fragaroides, or strawberry-like trailing potentilla, hath a somewhat tuberous root, furnished with many long fibres, long trailing shoots, rooting at the joints; pinnated, mostly three-lobed leaves, having oval lobes, with the extreme lobe the largest, and clusters of small white flowers. This species bears a great resemblance to the small sterile strawberry plants. 6. The argentea, silvery upright potentilla, hath upright stalks, branching a foot high; and five-lobed leaves, having the lobes wedge-shaped, cut on the edges, hoary and white underneath, and the branches terminated by small yellow flowers.

All these plants flower in June and July; the flowers are composed each of five roundish petals, and about 20 stamina. They are all very hardy, and may be employed in the different compartments of the pleasure ground. Their propagation is very easy. The shrubby potentilla may be propagated abundantly by suckers, layers, and cuttings; all of which will readily grow, and make plants in one year, which after having two or three years growth in the nursery will be fit for any of the shrubby compartments. All the herbaceous kinds may be propagated by parting the roots in autumn or spring, or by seed in any of those seasons.

POTERIUM, GARDEN BURNET: A genus of the polyandria order, belonging to the monœcia class of plants and in the natural method ranking under the 54th order, *Miscellanea*. The male calyx is tetraphyllous; the corolla quadripartite; and there are from 30 to 40 stamina. The female calyx is tetraphyllous; the corolla quadripartite; there are two pistils; the berry is formed of the indurated tube of the corolla. The species are, 1. The sanguiforba, or common garden burnet, hath fibry perennial roots, crowned by a large tuft of pinnated leaves, or six or seven pair of sawed lobes, terminated by an odd one; upright angular stalks, dividing, and branching a foot and a half high, terminated by oblong spikes of purplish red flowers. This species grows wild in England, in chalky soils; but has been long cultivated as a choice salad-herb for winter and spring use, it being of a warm nature; the young leaves are the useful parts. It is perennial in root, and retains its radical leaves all the year, but the stalks are

annual. 2. The hybridum, hybrid agrimony-leaved Montpelier burnet, rises with upright, taper, closely gathered stalks two feet high; pinnated odoriferous leaves of three or four pair of sawed lobes, terminated by an odd one; and the stalks terminated by long foot-stalks dividing into smaller, each supporting a small roundish spike of flowers. This species often proves biennial; but by cutting down some of the stalks before they flower, it will cause it to multiply at bottom, and become abiding. 3. Poterium spinosum, shrubby spinous burnet of Crete, hath a shrubby stem and branches, rising a yard high, armed with spines; small pinnated evergreen leaves, of six or seven pair of lobes, terminated by an odd one, and the branches terminated by small heads of greenish flowers.

All these species flower in June and July, succeeded by ripe seeds in Autumn. They are all naturally perennial; but the two herbaceous ones are abiding in root only; the other in root, stem, and branches: the two former are hardy, and the third requires shelter in winter. The first sort merits culture in every kitchen-garden for winter and spring salads. Some plants, both of the first and second sorts, may be introduced in the herbaceous collection in the pleasure-garden for variety. The third sort must be kept always in pots to have shelter in winter. They are all easily propagated, the first sort by seed and by parting the roots. The second sort may also be increased by seeds and slips of the root, as for the former sort. And the propagation of the third is by slips or cuttings of the branches in spring and summer, planted in pots, and placed under glasses, giving shade and water; or might be forwarded more by plunging them in a hot-bed.

Burnet is of a heating, drying nature, cordial and alexipharmac; in summer, the leaves are used for cool tankards, to give the wine an agreeable flavour. The powder of the root of the first species is commended against spitting of blood, bleeding at the nose, dysenteries, and diseases attended with violent secretions. In winter and spring, the young tender leaves are used in salads. For its uses as food for cattle, see AGRICULTURE, n^o 184.

POTHOS, in botany; a genus of the polyandria order, belonging to the gynandria class of plants. The spathe or sheath is a simple spadix covered; there is no calyx but four petals, and as many stamina; the berries dispermous.

POTION, a liquid medicine, consisting of as much as can be drunk at one draught.

POTIPHAR, or **PUTIPHAR**, an officer of the court of Pharaoh king of Egypt, and general of his troops, according to our translation, Le Clerc, and the version of the vulgate; but according to the Hebrew and Septuagint, the chief of his butchers or cooks. The Hebrew text, the Septuagint, and vulgate, call him Eunuch. But it is probable it in this place means only an officer of the king's court, for he was certainly married and had children. We have no other accounts of him but what appear in scripture; and that account is too generally known to require to be enlarged on in this place. See Genesis xxxviii. xxxix. &c.

POTOSI, a city of Peru in South America, situated at the bottom of a mountain of that name, in which is the richest silver mine ever discovered. To give an idea of its richness, we shall mention its produce at different

Potſdam.
Pott.

ferent times. Exclusive of what was not registered, ſays Abbé Raynal, and was ſmuggled away, the fifth part belonging to the government, from 1545 to 1564, amounted to 36,450,000 livres * *per annum*. But this abundance of metals ſoon decreaſed. From 1564 to 1585, the annual fifth part amounted to no more than 15,187,489 livres four ſols ſ. From 1585 to 1624, it amounted to 12,149,994 livres 12 ſols †. From 1624 to 1633, to 6,074,997 livres ſix ſols ‡. From this laſt period, the produce of theſe mines hath ſo evidently decreaſed, that in 1763 the fifth part, belonging to the king, did not exceed 1,364,682 livres 12 ſols ||. Situated in W. Long. 67. POTSDAM, or POSTDAM, a town of Germany, in the circle of Upper Saxony, with a palace, belonging to the king of Prussia. It is ſeated in an iſland ten miles in circumference, formed by the rivers Sprae and Havel. The palace is very curious, and finely built upon a delightful ſpot 12 miles weſt of Berlin. E. Long. 13. 42. N. Lat. 52. 34. Reiſbeck in his travels informs us, that the houſes in Potſdam are ſtill finer than thoſe of Berlin; but like them they are inhabited only by perſons of the lower and middling ranks.

POT'T (Percival), was born in London in 1713. He received the firſt rudiments of his education at a private ſchool at Darne in Kent; and became an apprentice to Mr Nourſe, one of the ſurgeons of St Bartholomew's hoſpital; of which hoſpital, in 1744-5, he was elected an aſſiſtant ſurgeon, and in 1749 appointed one of the principal ſurgeons. In 1746, he married the daughter of Robert Cruttenden, Eſq. His firſt publication is ſaid to have been planned in 1756, during his confinement in conſequence of a compound fracture of the leg: from that time, his pen was ſeldom long unemployed. His practice and his reputation were now rapidly increaſing: in 1764, he was elected a fellow of the Royal Society; and afterward was complimented with honorary diplomas from the Royal Colleges of Surgeons at Edinburgh and in Ireland. In 1787, he reſigned the office of ſurgeon to St Bartholomew's hoſpital, "after having ſerved it (as he uſed to ſay), man and boy, half a century; and on the 22d of December 1788, after an illneſs of eight days, he expired.

"The labours of the greateſt part of his life (ſays Mr Earle, who publiſhed his Chirurgical works), were without relaxation: an increaſing family required his utmoſt exertion: of late years he had a villa at Neaſden; and in the autumn uſually paſſed a month at Bath, or at the ſea-ſide. Thus, though he gathered, as he expreſſed it, ſome of the fruit of the garden which he had planted as he went along, and always lived in a generous and hoſpitable manner, at the ſame time beſtowing on four ſons and four daughters a liberal and neceſſarily expenſive education, and applying large ſums to their eſtabliſhment during his lifetime, he left an ample provision for them at his deceaſe. Among his papers was found, what he had often mentioned, a ſmall box, containing a few pieces of money, being the whole which he ever received from the wreck of his father's fortune. With this was depoſited an exact account of every individual ſee which a long life of buſineſs had produced—abundant evidence of well ſpent time, and the induſtrious application of abi-

lities, to which the *res anguſta domi*, at the commencement probably acted more powerfully as an incentive than as an obſtacle."

POT'TER (Chriſtopher), a learned Engliſh divine, was born in 1591, and bred at Oxford. In 1633, he publiſhed his "Anſwer to a late Popiſh Plot," intitled *Charity miſtaken*, which he wrote by ſpecial order of King Charles I. whoſe chaplain he was. In 1634, he was promoted to the deanery of Worceſter; and, in 1640, was conſtituted vice-chancellor of the univerſity of Oxford, in the execution of which office he met with ſome trouble from the members of the long parliament. Upon breaking out of the civil wars, he ſent all his plate to the king, declaring, "that he would rather, like Diogenes, drink in the hollow of his hand, than that his majeſty ſhould want;" and he afterwards ſuffered much for the royal cauſe. In conſideration of this he was nominated to the deanery of Durham in 1646, but was prevented from being inſtalled by his death, which happened about two months after. He was a perſon learned and religious, exemplary in his converſation, courteous in his carriage, of a ſweet and obliging nature, and of a comely preſence. He was remarkable in his charity to the poor.

POTTER (Dr John), archbiſhop of Canterbury, was the ſon of a linen-draper at Wakefield in Yorkſhire, where he was born about the year 1674. He ſtudied at Univerſity college, Oxford; and at 19 publiſhed *Variantes lectiones & notæ ad Plutarchi librum de audiendis poetis; & ad Baſilii magni orationem ad juvenes, quomodo cum fruſtu legere poſſint Græcorum libros*, 8vo, 1693. In 1697, came out his edition of *Lycophron*, in folio; which is reckoned the beſt of that obſcure writer: ſoon after, he publiſhed his *Antiquities of Greece*, 2 vols. 8vo. Theſe works eſtabliſhed his literary reputation, and engaged him in a correſpondence with Grævius and other learned foreigners. In 1706, he was made chaplain to the queen; in 1715, biſhop of Oxford; and in 1737, he ſucceeded archbiſhop Wake in the ſee of Canterbury; which high ſtation he ſupported with much dignity until his death in 1747. He was a learned and exemplary churchman; but not of an amiable diſpoſition, being but too ſtrongly tinctured with the pride of office; nor is it to his credit that he diſinherited his eldeſt ſon for marrying below his rank in life. His "Theological works, containing ſermons, charges, diſcourſes on church-government, and divinity lectures," were printed at Oxford, in 3 vols, 8vo, 1753.

POTTERY, the manufacture of earthen-ware, or the art of making earthen veſſels. See *DELFT-Ware*, *STONE-Ware*, and *PORCELAIN*, &c.

The wheel and lathe are the chief and almoſt the only inſtruments in pottery: the firſt for large works, and the laſt for ſmall. The potter's wheel conſiſts principally in the nut, which is a beam or axis, whoſe foot or pivot plays perpendicularly on a free-ſtone ſole or bottom. From the four corners of this beam, which does not exceed two feet in height, ariſe four iron bars, called the *ſpokes of the wheel*; which forming diagonal lines with the beam, deſcend, and are faſtened at bottom to the edges of a ſtrong wooden circle, four feet in diameter, perfectly like the felloes of a coach-wheel, except that it has neither axis nor radii, and is only joined to the beam, which ſerves it as an axis by the iron-bars. The top of the nut is flat, of a cir-

Pottet,
Portery.

Pottery
||
Poverty.

cular figure, and a foot in diameter; and on this is laid the clay which is to be turned and fashioned. The wheel thus disposed is encompassed with four sides of four different pieces of wood fastened on a wooden frame; the hind-piece, which is that on which the workman sits, is made a little inclining towards the wheel; on the fore-piece are placed the prepared earth; on the side-pieces he rests his feet, and these are made inclining to give him more or less room. Having prepared the earth, the potter lays a round piece of it on the circular head of the lathe, and sitting down turns the wheel with his feet till it has got the proper velocity; then, wetting his hands with water, he presses his fist or his finger-ends into the middle of the lump, and thus forms the cavity of the vessel, continuing to widen it from the middle; and thus turning the inside into form with one hand, while he proportions the outside with the other, the wheel constantly turning all the while, and he wetting his hands from time to time. When the vessel is too thick, he uses a flat piece of iron, somewhat sharp on the edge, to pare off what is redundant; and when it is finished, it is taken off from the circular head by a wire passed under the vessel.

The potter's lathe is also a kind of wheel, but more simple and slight than the former: its three chief members are an iron beam or axis three feet and a half high, and two feet and a half diameter, placed horizontally at the top of the beam, and serving to form the vessel upon: and another large wooden wheel, all of a piece, three inches thick, and two or three feet broad, fastened to the same beam at the bottom, and parallel to the horizon. The beam or axis turns by a pivot at the bottom in an iron stand. The workman gives the motion to the lathe with his feet, by pushing the great wheel alternately with each foot, still giving it a greater or lesser degree of motion as his work requires. They work with the lathe with the same instruments, and after the same manner, as with the wheel. The mouldings are formed by holding a piece of wood or iron cut in the form of the moulding to the vessel, while the wheel is turning round; but the feet and handles are made by themselves and set on with the hand; and if there be any sculpture in the work, it is usually done in wooden moulds, and stuck on piece by piece on the outside of the vessel. For the glazing of the work, see GLAZING.

POTTLE, an English measure containing two quarts.

POVERTY signifies indigence or want of riches, and has been the lot of a large portion of men in every age. Whether, on the whole, it has been productive of good or bad consequences, has been disputed. In a moral view, perhaps it has been, on the whole, useful, as adversity is in general more conducive to virtue than prosperity, which too often leads to luxury and vice.— Sometimes, however, poverty has had a baneful effect upon the mind, and has prompted men to commit very inhuman actions; but this in civilized communities very seldom occurs. In a political view, poverty is thought by some to be hurtful: Raynal thinks it is a check to population, (see his History, vol vi. p. 471.); and Dr Smith so far agrees with him; for though he asserts, and indeed proves, that poverty is no check to the production of children, he allows it to be very unfavour-

able to raising them. See *Smith's Wealth of Nations*, vol. i. p. 119, &c. See also POOR.

POULADUFF, two remarkable great holes in the ground, about a mile west of Ross, in the county of Cork, and province of Munster, in Ireland, 80 yards deep, in which the sea flows by subterraneous passages. They are called East and West *Pouladuff*; one is on the lands of Downeen, and the other on Tralong.

POULTICE, a sort of medicine, called also a *cataplasm*. See CATAPLASMA.

POULTRY, all kind of domestic birds brought up in yards, as cocks, hens, capons, ducks, turkeys, &c.

Almost all the domestic birds of the poultry kind that we maintain in our yards are of foreign extraction: but there are others to be ranked in this class that are as yet in a state of nature, and perhaps only wait till they become sufficiently scarce to be taken under the care of man to multiply their propagation. It will appear remarkable enough, if we consider how much the tame poultry which we have imported from distant climates has increased, and how much those wild birds of the poultry kind that have never yet been taken into keeping have been diminished and destroyed. They are all thinned; and many of the species, especially in the more cultivated and populous parts of the country are utterly unseen.

Under birds of the poultry kind may be ranked all those that have white flesh, and, comparatively to their heads and limbs, have bulky bodies. They are furnished with short strong bills for picking up grain, which is their chief and often their only sustenance. Their wings are short and concave; for which reason they are not able to fly far. They lay a great many eggs; and as they lead their young abroad, the very day they are hatched, in quest of food, which they are shown by the mother, and which they pick up for themselves, they generally make their nests on the ground. The toes of all these are united by a membrane as far as the first articulation, and are then divided.

Under this class we may therefore render the common cock, the peacock, the turkey, the pintada or Guinea hen, the pheasant, the bustard, the grouse, the partridge, and the quail. They all bear a strong similitude to each other, being equally granivorous, fleshy, and delicate to the palate. They are among birds what beasts of pasture are among quadrupeds, peaceable tenants of the field, and shunning the thicker parts of the forest, that abound with numerous animals who carry on unceasing hostilities against them.

As nature has formed the rapacious class for war, so she seems equally to have fitted these for peace, rest, and society. Their wings are but short, so that they are ill formed for wandering from one region to another: their bills are also short, and incapable of annoying their opposers: their legs are strong indeed; but their toes are made for scratching up their food, and not for holding or tearing it. These are sufficient indications of their harmless nature; while their bodies, which are fat and fleshy, render them unwieldy travellers, and incapable of straying far from each other.

Accordingly, we find them chiefly in society: they live together: and though they may have their disputes, like all other animals, upon some occasions; yet, when kept in the same district, or fed in the same

Pouladuff

Poultry.

Pounce
||
Pouffin.

fame yard, they learn the arts of subordination; and, in proportion as each knows his strength, he seldom tries a second time the combat where he has once been worsted.

In this manner, all of this kind seem to lead an indolent voluptuous life. As they are furnished internally with a very strong stomach, commonly called a *gizzard*, so their voraciousness scarce knows any bounds. If kept in close captivity, and separated from all their former companions, they have still the pleasure of eating left; and they soon grow fat and unwieldy in their prison. To say this more simply, many of the wilder species of birds, when cooped or caged, pine away, grow gloomy, and some refuse all sustenance whatever; none except those of the poultry kind grow fat, who seem to lose all remembrance of their former liberty, satisfied with indolence and plenty.

POUNCE, gum sandarach pounded and sifted very fine, to rub on paper in order to preserve it from drinking, and to make it more fit to write upon.

POUNCE, is also a little heap of charcoal dust, inclosed in a piece of muslin or some other open stuff, to be passed over holes pricked in a work, in order to mark the lines or designs thereof on paper, silk, &c. placed underneath; which are to be afterwards finished with a pen and ink, a needle, or the like. This kind of pounce is much used by embroiderers, to transfer their patterns upon stuffs; by lace-makers, and sometimes also by engravers.

POUNCES, in falconry, the talons or claws of a bird of prey.

POUND, a standard-weight; for the proportion and subdivisions of which, see the article **WEIGHT**.

POUND also denotes a money of account; so called, because that ancient pound of silver weighed a pound one penny troy.

POUND, among lawyers, denotes a place of strength, in which to keep cattle that are distrained, or put in for trespass, until they are replevied or redeemed.

POUNDAGE, in England a subsidy of 12d. in the pound, granted to the crown on all goods and merchandizes exported or imported; and if by aliens, more

POURPRESTURE, in law, is a wrongful inclosure, or incroachment upon another person's property.

POURSUIVANT, or **PURSUIVANT**, in heraldry, the lowest order of officers at arms.—They are properly attendants on the heralds when they marshal public ceremonies. Of these in England there were formerly many; but at present there are only four, viz. blue mantle, rouge-crois, rouge-dragon, and port-culice. In Scotland there is only one king at arms, who is styled *Lyon*; and has under him no less than six heralds, as many pursuivants, and a great many messengers at arms. See **LYON**.

POURVEYANCE, or **PURVEYANCE**, in English law, the providing corn, fuel, victuals, &c. for the king's household; and hence the officer who did so was termed *pourveyeur*. As several offences were committed by these officers, it was enacted by stat. 12. Car. II. that no person, under colour of *pourveyance*, shall take any timber, cattle, corn, &c. from any subject without his free consent, or without a just appraisement and paying for the same.

POUSSIN (Nicholas), an eminent French painter,

born in 1594, at Andel, a little city in Normandy, where his father was of noble extraction, but born to a small estate. He was instructed for a few months by one Ferdinand Elle, a portrait-painter, and afterwards spent a month with L'Allemand; but finding these artists not likely to improve him suitably to his desires, he first studied the paintings of the best masters, and then hastened to finish a few pieces he was engaged in, and travelled to Italy. Here he devoted almost his whole attention to the study of antique statues and bas-reliefs; which was probably the cause of his want of knowledge in, and taste for, the art of colouring. Being invited back to Paris by Louis XIII. who assigned him a pension with lodgings in the Thuilleries, he painted for prince Justiniani an historical picture representing Herod's cruelty; an admirable composition, in which he gave such expression to every character, as could not fail to strike the beholder with terror and pity: he then laboured for several years on the celebrated pictures of the seven sacraments of the Romish church. But none of Poussin's designs have been more generally admired than that of the death of Germanicus; which would have gained him immortal honour if he had never painted another picture. He began the labours of Hercules in the gallery of the Louvre; but the faction of Vouet's school railing at him and his performances, put him so out of humour with his own country, that he returned to Rome, where he died in 1665. He never went beyond easel-pieces, for which he had a perpetual demand; and his method was to fix the price he expected on the back of the canvas, which was readily paid.

POUSSIN (Gaspar). This painter, whose real name was *Dughet*, was born at Paris in 1600; and was induced to travel to Rome, not only from a love to the art of painting, but also to visit his sister, who was married to Nicholas Poussin. Sandrart says that Gaspar was employed at first only to prepare the pallet, pencils, and colours, for Nicholas; but by the precepts and example of that excellent master, gradually rose to the highest reputation, and is undoubtedly one of the best landscape-painters that ever appeared. It is generally thought that no painter ever studied nature to better purpose, or represented the effects of land-storms more happily, than Gaspar; all his trees show a natural degree of agitation, every leaf being in motion; his scenes are all beautifully chosen, as are the sites of his buildings. He designed human figures but very indifferently; for which reason he frequently prevailed on Nicholas to paint them for him; and they were always introduced with the utmost propriety. While he continued at Rome he dropped his own name, and assumed that of his brother-in-law and benefactor, by which only he is at present known. He died in 1662.

POWDER, in pharmacy, a dry medicine well broken, either in a mortar by grinding or by some chemical operation.

GUN-POWDER. See **GUNPOWDER**. See also *Observations on Gunpowder in the Irish Transactions* 1788, p. 97. class *Science*, by Mr Napier.

POWDER-Chests, certain small boxes charged with powder and a quantity of old nails or splinters of iron, and fastened occasionally on the deck and sides of a ship, in order to be discharged on an enemy who attempts to seize her by boarding. These cases are usually

Poussin,
Powder.

Powder
H
Powers.

ally from 12 to 18 inches in length, and about eight or ten in breadth, having their outer or upper part terminating in an edge. They are nailed to several places of the quarter-deck and bulk-head of the waist, having a train of powder, which communicates with the inner apartments of the ship, so as to be fired at pleasure to annoy the enemy. They are particularly used in merchant-ships which are furnished with close-quarters to oppose the boarders.

Powder Magazine, a bomb-proof arched building, to contain powder in fortified places.

Powder for the Hair. The best sort is starch well pounded and sifted, and generally prepared with some perfume.

James's Powder. See *JAMES's Powder*. In the Philosophical Transactions for 1791, p. 317. there is a paper by Dr Pearson, containing experiments and observations on James's powder. Dr Pearson says, it was originally a patent medicine; but it is well known that it cannot be prepared by following the directions of the specification in the court of chancery. His observations and experiments, therefore, he thinks, may explain the nature and manner of preparing this medicine, and perhaps may extend the history of antimony. The result of the whole, in Dr Pearson's own words, is as follows:

1. James's powder consists of phosphoric acid, lime, and antimonial calx; with a minute quantity of calx of iron, which is considered to be an accidental substance.
2. Either these three essential ingredients are united with each other, forming a triple compound, or phosphorated lime is combined with the antimonial calx, composing a double compound in the proportion of about 57 parts of calx and 43 parts of phosphorated lime.
3. This antimonial calx is different from any other known calx of antimony in several of its chemical qualities. About three-fourths of it are soluble in marine acid, and afford Algaroth powder; and the remainder is not soluble in this menstrum, and is apparently vitrified. It also appears, that by calcining together bone-ashes, that is, phosphorated lime and antimony in a certain proportion, and afterwards exposing the mixture to a white heat, a compound was formed, consisting of antimonial calx and phosphorated lime in the same proportion, and possessing the same kind of chemical properties as James's powder.

POWDIKE, in the fens of Norfolk and Ely. By stat. 22 Hen. VIII. c. 11. perversely to cut down and destroy the powdike in the fens of Norfolk and Ely is felony. See *Blackstone's Commentaries* vol. iv. p. 243.

POWER, has been defined the faculty of doing or suffering any thing. Power, therefore, is two-fold, viz. considered as able to make, or able to receive, any change; the former whereof may be called *active*, and the latter *passive power*: but this distinction is improper. See *METAPHYSICS*, n° 116.

POWER, in mechanics, denotes any force, whether of a man a horse, a spring, the wind, water &c. which being applied to a machine, tends to produce motion.

POWER, in law, signifies in general a particular authority granted by any person to another to represent him, or to act in his stead.

POWERS in arithmetic and algebra, are nothing but the products arising from the continual multiplications of a number or quantity into itself. See *ALGEBRA* and *ARITHMETIC*.

POX, *French-Pox*, or *Lues Venerea*. See *MEDICINE*, n° 350

Small-Pox See *INOCULATION*, and *MEDICINE*, n° 222—226.

POYNING's LAW, an act of parliament made in Ireland under Henry VII. whereby all the statutes of force in England were made of force in Ireland; which before that time they were not.—Nor are any now in force there made in England since that time.

The law took its name from Sir Edward Poyning, lord-lieutenant of that kingdom at the time of its making. See *IRELAND*, n° 46.

POZZOLANA, See *PUZZOLANA*.

PRACTICE, in arithmetic. See there, n° 46. &c.

Gun-PRACTICE, in English military education. In the spring, as soon as the weather permits, the exercise of the great guns begins, with an intention to show the gentlemen cadets at the royal military academy at Woolwich, and private men, the manner of laying, loading, pointing, and firing the guns. Sometimes instruments are used to find the centre line, or two points, one at the breech, the other at the muzzle, which are marked with chalk, and whereby the piece is directed to the target: then a quadrant is put into the mouth to give the gun the required elevation, which at first is guessed at, according to the distance the target is from the piece. When the piece has been fired, it is sponged to clear it from any dust or sparks of fire that might remain in the bore, and loaded: then the centre line is found as before; and if the shot went too high or too low, to the right or to the left, the elevation and trail are altered accordingly. This practice continues morning and evening for about six weeks, more or less according as there are a greater or less number of recruits. In the mean time others are shown the motions of quick-firing with field-pieces.

Mortar-PRACTICE, generally thus. A line of 1500, or 2000 yards is measured in an open spot of ground from the place where the mortars stand, and a flag fixed at about 300 or 500 yards: this being done, the ground where the mortars are to be placed is prepared and levelled with sand, so that they may lie at an elevation of 45 degrees; then they are loaded with a small quantity of powder at first, which is increased afterwards by an ounce every time, till they are loaded with a full charge; the times of the flights of the shells are observed, to determine the length of the fuzes. The intention of this practice is, when a mortar battery is raised in a siege, to know what quantity of powder is required to throw the shells into the works at a given distance, and to cut the fuzes of a just length, that the shell may burst as soon as it touches the ground.

PRÆMUNIRE, in English law, is taken either for a writ so called, or for the offence whereon the writ is granted; the one may be understood by the other.—The church of Rome, under pretence of her supremacy and the dignity of St Peter's chair, took on her to bestow most of the ecclesiastical livings of any worth in England, by mandates, before they were void; pretending therein great care to see the church provided of a successor before it needed. Whence these mandates or bulls were called *gratia expectativa*, or *provisiones*; whereof see a learned discourse in *Duarenus de beneficiis*,

Pox
H
Præmunire.

Præmunire.

Blackst.
Comment.

beneficiis, lib. 3. cap. 1. These provisions were so common, that at last Edward I. not digesting so intolerable an encroachment, in the 35th year of his reign made a statute against papal provisions, which, according to Sir Edward Coke, is the foundation of all the subsequent statutes of præmunire: which is ranked as an offence immediately against the king, because every encouragement of the papal power is a diminution of the authority of the crown.

In the weak reign of Edward II. the pope again endeavoured to encroach, but the parliament manfully withstood him; and it was one of the articles charged against that unhappy prince, that he had given allowance to the bulls of the see of Rome. But Edw. III. was of a temper extremely different; and, to remedy these inconveniences, first by gentle means, he and his nobility wrote an expostulation to the pope: but receiving a menacing and contemptuous answer, withal acquainting him, that the emperor (who a few years before at the diet of Nuremberg, A. D. 1323, had established a law against provisions), and also the king of France, had lately submitted to the holy see; the king replied, that if both the emperor and the French king should take the pope's part, he was ready to give battle to them both, in defence of the liberties of the crown. Hereupon more sharp and penal laws were devised against provisors, which enact severally, that the court of Rome shall present or collate to no bishopric or living in England; and that whoever disturbs any patron in the presentation to a living by virtue of a papal provision, such provisor shall pay fine and ransom to the king at his will, and be imprisoned till he renounces such provision; and the same punishment is inflicted on such as cite the king, or any of his subjects, to answer in the court of Rome. And when the holy see resented these proceedings, and pope Urban V. attempted to revive the vassalage and annualrent to which king John had subjected his kingdom, it was unanimously agreed by all the estates of the realm in parliament assembled, 40 Edw. III. that king John's donation was null and void, being without the concurrence of parliament, and contrary to his coronation-oath; and all the temporary nobility and commons engaged, that if the pope should endeavour by process or otherwise to maintain these usurpations, they would resist and withstand him with all their power.

In the reign of Richard II. it was found necessary to sharpen and strengthen these laws, and therefore it was enacted by statutes 3 Ric. II. c. 3. and 7. Ric. II. c. 12. first, that no alien shall be capable of letting his benefice to farm; in order to compel such as had crept in, at least to reside on their preferments: and afterwards, that no alien should be capable to be presented to any ecclesiastical preferment, under the penalty of the statutes of provisors. By the statute 12 Rich. II. c. 15. all liegemen of the king accepting of a living by any foreign provision, are put out of the king's protection, and the benefice made void. To which the statute 13 Rich. II. ft. 2. c. 2. adds banishment and forfeiture of land and goods: and by c. 3. of the same statute, any person bringing over any citation or excommunication from beyond sea, on account of the execution of the foregoing statutes of provisors, shall be imprisoned; forfeit his goods and lands, and moreover suffer pain of life and member.

In the writ for the execution of all these statutes, the words *præmunire facias* being used to command a citation of the party, have denominated in common speech, not only the writ, but the offence itself of maintaining the papal power, by the name of *præmunire*. And, accordingly, the next statute we shall mention, which is generally referred to by all subsequent statutes, is usually called the *statute of præmunire*. It is the statute 16 Richard II. c. 5. which enacts, that whoever procures at Rome, or elsewhere, any translations, processes, excommunications, bulls, instruments, or other things which touch the king, against him, his crown, and realm, and all persons aiding and assisting therein, shall be put out of the king's protection, their lands and goods forfeited to the king's use, and they shall be attached by their bodies to answer to the king and his council; or process of *præmunire facias* shall be made out against them as in other cases of provisors.

By the statute 2 Henry IV. c. 3. all persons who accept any provision from the pope, to be exempt from canonical obedience to their proper ordinary, are also subjected to the penalties of præmunire. And this is the last of the ancient statutes touching this offence: the usurped civil power of the bishop of Rome being pretty well broken down by these statutes, as his usurped religious power was in about a century afterwards: the spirit of the nation being so much raised against foreigners, that about this time, in the reign of Hen. V. the alien priories, or abbeyes for foreign monks, were suppressed, and their lands given to the crown. And no farther attempts were afterwards made in support of these foreign jurisdictions.

This, then, is the original meaning of the offence which we call *præmunire*; viz. introducing a foreign power into the land, and creating *imperium in imperio*, by paying that obedience to papal process which constitutionally belonged to the king alone, long before the Reformation in the reign of Henry VIII. at which time the penalties of præmunire were indeed extended to more papal abuses than before; as the kingdom then entirely renounced the authority of the see of Rome, though not at all the corrupted doctrines of the Roman church. And therefore, by the several statutes of 24 Hen. VIII. c. 12. and 25 Hen. VIII. c. 19. & 21. to appeal to Rome from any of the king's courts, which (though illegal before) had at times been connived at; to sue to Rome for any licence or dispensation, or to obey any process from thence, are made liable to the pains of præmunire. And, in order to restore to the king in effect the nomination of vacant bishoprics, and yet keep up the established forms, it is enacted by statute 25 Hen. VIII. c. 20. that if the dean and chapter refuse to elect the person named by the king, or any archbishop or bishop to confirm or consecrate him, they shall fall within the penalties of the statutes of præmunire. Also by statute 5 Eliz. c. 1. to refuse the oath of supremacy will incur the pains of præmunire; and to defend the pope's jurisdiction in Britain, is a præmunire for the first offence, and high treason for the second. So, too, by statute 13 Eliz. c. 2. to import any *agnus Dei*, crosses, beads, or other superstitious things pretended to be hallowed by the bishop of Rome, and tender the same to be used; or to receive the same with such intent, and not discover the offender; or if a justice of the peace, knowing thereof, shall not within

Præmunire

Præmunire.

14 days declare it to a privy-counsellor, they all incur a præmunire. But importing or selling mass-books, or other Popish books, is by stat. 3. Jac. I. c. 5. § 25. only liable to a penalty of 40 s. Lastly, to contribute to the maintenance of a Jesuit's college, or any Popish seminary whatever beyond sea, or any person in the same, or to contribute to the maintenance of any Jesuit or Popish priest in England, is by statute 27 Eliz. c. 2. made liable to the penalties of præmunire.

Thus far the penalties of præmunire seem to have kept within the proper bounds of their original institution, the depressing the power of the pope: but they being pains of no considerable consequence, it has been thought fit to apply the same to other heinous offences; some of which bear more, and some less, relation to this original offence, and some no relation at all.

Thus, 1. By the statute 1 & 2 Ph. and Mar. c. 8. to molest the possessors of abbey-lands granted by parliament to Henry VIII. and Edward VI. is a præmunire. 2. So likewise is the offence of acting as a broker or agent in any usurious contract where above 10 per cent. interest is taken, by statute 13 Eliz. c. 10. 3. To obtain any stay of proceedings, other than by arrest of judgment or writ of error, in any suit for a monopoly, is likewise a præmunire, by stat. 21. Jac. I. c. 3. 4. To obtain an exclusive patent for the sole making or importation of gunpowder or arms, or to hinder others from importing them, is also a præmunire by two statutes; the one 16 Car. I. c. 21. the other 1 Jac. II. c. 8. 5. On the abolition, by stat. 12. Car. II. c. 24. of purveyance, and the prerogative of pre-emption, or taking any victual, beast, or goods for the king's use, at a stated price, without consent of the proprietor, the exertion of any such power for the future was declared to incur the penalties of præmunire. 6. To assert, maliciously and advisedly, by speaking or writing, that both or either house of parliament have a legislative authority without the king, is declared a præmunire by statute 13 Car. II. c. 1. 7. By the *habeas corpus* act also, 31 Car. II. c. 2. it is a præmunire, and incapable of the king's pardon, besides other heavy penalties, to send any subject of the realm a prisoner into parts beyond the seas. 8. By the statute 1 W. & M. st. 1. c. 8. persons of 18 years of age refusing to take the new oaths of allegiance as well as supremacy, upon tender by the proper magistrate, are subject to the penalties of a præmunire; and by statutes 7 & 8 W. III. c. 24. serjeants, counsellors, proctors, attorneys, and all officers of courts, practising without having taken the oaths of allegiance and supremacy, and subscribed the declaration against popery, are guilty of a præmunire whether the oaths be tendered or not. 9. By the statute 6 Ann. c. 7. to assert maliciously and directly, by preaching, teaching, or advised speaking, that the then pretended prince of Wales, or any person other than according to the acts of settlement and union, hath any right to the throne of these kingdoms, or that the king and parliament cannot make laws to limit the descent of the crown; such preaching, teaching, or advised speaking, is a præmunire: as writing, printing, or publishing the same doctrines amounted, we may remember, to high treason. 10. By statute 6 Ann. c. 23. if the assembly of peers of Scotland, convened to elect their 16 representatives in the British parliament, shall presume to treat of any other matter save only the election, they incur the penalties

of a præmunire. 11. The stat. 6 Geo. I. c. 18. (enacted in the year after the infamous South Sea project had beggared half the nation) makes all unwarrantable undertakings by unlawful subscriptions, then commonly known by the name of *bubbles*, subject to the penalties of a præmunire. 12. The stat. 12. Geo. III. c. 11. subjects to the penalties of the statute of præmunire all such as knowingly and wilfully solemnize, assist, or are present at, any forbidden marriage of such of the descendants of the body of king Geo. II. as are by that act prohibited to contract matrimony without the consent of the crown.

Having thus enquired into the nature and several species of præmunire, its punishment may be gathered from the foregoing statutes, which are thus shortly summed up by Sir Edward Coke: "That, from the conviction, the defendant shall be out of the king's protection, and his lands and tenements, goods and chattels, forfeited to the king; and that his body shall remain in prison at the king's pleasure, or (as other authorities have it) during life; both which amount to the same thing, as the king by his prerogative may at any time remit the whole, or any part of the punishment, except in the case of transgressing the statute of *habeas corpus*. These forfeitures here inflicted do not (by the way) bring this offence within our former definition of FELONY; being inflicted by particular statutes, and not by the common law." But so odious, Sir Edward Coke adds, was this offence of præmunire, that a man that was attainted of the same, might have been slain by any other man without danger of law; because it was provided by law, that any man might do to him as to the king's enemy; and any man may lawfully kill an enemy. However, the position itself, that it is at any time lawful to kill an enemy, is by no means tenable: it is only lawful, by the law of nature and nations, to kill him in the heat of battle, or for necessary self-defence. And to obviate such savage and mistaken notions, the statute 5 Eliz. c. 1. provides, that it shall not be lawful to kill any person attainted in a præmunire, any law, statute, opinion, or exposition of law to the contrary notwithstanding. But still such delinquent, though protected as a part of the public from public wrongs, can bring no action for any private injury, how atrocious soever; being so far out of the protection of the law, that it will not guard his civil rights, nor remedy any grievance which he as an individual may suffer. And no man, knowing him to be guilty, can with safety give him comfort, aid, or relief.

PRÆNESTE (anc. geog.), a town of Latium, to the south-east of Rome, towards the territory of the Æqui; a place of great strength. Famous for the temple and oracle of Fortune, called *Sortes Prænestina* (Strabo); which Tiberius wanted to destroy, but was deterred by the awful majesty of the place. From a colony it was raised to a municipium by Tiberius (Inscriptions, Florus, A. Gellius), on the consideration of his recovery from a dangerous illness near this place. Thither the Roman emperors usually retired, on account of the agreeableness of the situation (Suetonius). It was a very ancient city, with a territory of large extent (Livy). The temple of Fortune was built in the most sumptuous manner by Sylla, and the pavement was Mosaic work (Pliny). Concerning the *Sortes*, there is a remarkable passage in Cicero; who says, that it was all a mere

Præmunire.
Præneste.

Præsidium
Prague.

a mere contrivance, in order to deceive, either for the purposes of gain or superstition. The town that has succeeded it stands low in a valley, and is called *Palaftrina*, in the Campania of Rome. E. Long. 13. 30. N. Lat. 42. 0.

PRÆSIDIUM (Notitia), a town of the Cornavii in Britain. Now thought to be Warwick (Camden).—Another of Corfica (Antonine), 30 miles to the south of Aleria.—A third *Præsidium* surnamed *Julium*, in Bætica (Pliny).

PRÆTORIA AUGUSTA (Ptolemy), a town of Dacia. Now called *Brassow* by the natives, and *Cronstadt* by the Germans (Baudrand): a town in Transylvania. E. Long. 25°. N. Lat. 47°.—Another of the Salassii, near the two gates or defiles of the Alps, the Grajæ and Pinninæ (Pliny); a Roman colony, settled by Augustus after the defeat of the Salassii by Terentius Varro, on the spot where he encamped (Strabo, Dio Cassius, Ptolemy), situated on the river Duria Major. The town is now called *Aosta* or *Aoust*, in Piedmont. E. Long. 7. 14. N. Lat. 45. 19.

PRÆTORIUM (Antonine, Notitia Imperii), a town of the Brigantes. Now *Paterington* (Camden), near the mouth of the Humber in Yorkshire. *Coventry* (Talbot).

PRAGMATIC SANCTION, in the civil law, is defined by Hottoman to be a rescript or answer of the sovereign, delivered by advice of his council, to some college, order, or body of people, upon consulting him on some case of their community. The like answer given to any particular person is called simply *rescript*.

The term *pragmatic sanction* is chiefly applied to a settlement of Charles VI. emperor of Germany, who, in the year 1722, having no sons, settled his hereditary dominions on his eldest daughter the archduchess Maria Theresa, which was confirmed by the diet of the empire, and guaranteed by Great Britain, France, the States-General, and most of the powers in Europe. The word *pragmatic* is derived from the Greek *πραγμα*, *negotium*, "business."—It is sometimes also called absolutely *pragmatic*, *το πραγματικον*.

PRAGUE, a city of Bohemia, and capital of the whole kingdom, is situated 14° 40' of longitude, and 50° 5' of latitude. It stands on both sides the Moldau, over which there is a bridge 700 feet long, built of large freestone. The river, though of great breadth here, is nevertheless shallow, and not navigable. On both sides the bridge are several statues, and among others that of St John of Nepomuch, whom king Wenzel caused to be thrown from the bridge into the river, for venturing to reprove him upon some occasion; but in 1720 he was canonized as a saint, and is at present held in such veneration in Bohemia, that all other saints seem on his account to be forgotten. Near the bridge, which stands at the upper part of the city, the number of people is very great, but the further you go from thence the more desolate you find every place. The city is about three miles long and two broad; the number of its Christian inhabitants is said to be 70,000, and of Jews about 12,000. The principal branch of its trade consists in brewing of beer. It is divided into the Old and the New Towns, and that called the *Small Side*; the former lying on the east side of the Moldau, and the latter on the west. The whole is about 12 miles in circumference. The fortifications are not of

Prague.

great importance, as it may be flanked and raked on all sides. However, the king of Prussia was not able to make himself master of it in the late war, though he almost destroyed it with his bombs, &c. See *PRUSSIA*, n° 24, &c.—It hath suffered greatly by sieges, and hath been often taken and plundered. The university was founded by Charles IV. in the year 1347. In 1409, when John Hufs was rector of the university, there were no less than 44,000 students; and when the emperor Charles V. would have retrenched their privileges, 24,000 are said to have left it in one week, and 16,000 in a short time after. The Jews have the trade of this city almost entirely in their own hands. They deal in all sorts of commodities, especially the precious stones found in the Bohemian mines, and, by receiving all old-fashioned things in payment, quite ruin the Christian handicraftsmen. In 1744 they narrowly escaped being expelled the kingdom, having been suspected of corresponding with the Prussians, when they made themselves masters of the city. The grand prior of the order of Malta, for Bohemia, Moravia, and Silesia, resides here; and the church and hospital of the Holy Ghost is the seat of the general and grandmasters of the holy order of knights of the cross with the red star, residing in the abovementioned countries, and in Poland and Hungary. The houses of this city are all built of stone, and generally consist of three stories; but there are very few good buildings in it, and almost every thing looks dirty. The cathedral, which is dedicated to St Veit, is an old building, in which there are some pieces of excellent architecture and many magnificent tombs of great men. There are 100 churches and chapels, and about 40 cloisters in the place. On Ratschin-hill, in Upper Prague, most of the nobility have houses, and the emperor a very magnificent palace, and a summer-house commanding one of the finest prospects in the world. Here the tribunals of the regency meet; and the halls, galleries, and other apartments, are adorned with a multitude of noble pictures. The great hall, where the coronation feast is kept, is said to be the largest of the kind in Europe next to that of Westminster. The castle stands on the abovementioned mountain, called *Ratschin* or the *White Mountain*, and is very strong. From a window of this castle the emperor's counsellors were thrown in 1618; but though they fell from a great height, yet they were not killed, nor indeed much hurt. On the same mountain stands also the archiepiscopal palace. In the New Town is an arsenal, and a religious foundation for ladies, called the *Free Temporal English Foundation*, over which an abbess presides. In the Lesser Side or Town, the counts Colloredo and Wallenstein have very magnificent palaces and gardens. The stables of the latter are very grand; the racks being of steel and the mangers of marble, and a marble pillar betwixt each horse; over each horse also is placed his picture as big as life. Though the inhabitants of Prague in general are poor, and their shops but meanly furnished, yet, it is said, there are few cities where the nobility and gentry are more wealthy, and live in greater state. Here is much gaming, masquerading, feasting, and very splendid public balls, with an Italian opera, and assemblies in the houses of the quality every night. On the White Mountain, near the town, was fought the battle in which the Protestants, with the elector Palatine Frederic their king, were defeated.

The lustres and drinking-glasses made here of Bohemian crystal are much esteemed, and vended all over Europe. These crystals are also polished by the Jews, and set in rings, ear-pendants, and shirt-buttons. The chief tribunal consists of twelve stadtholders, at the head of whom is the great burgrave, governor of the kingdom and city, immediately under the emperor, and the chancery of Bohemia. Though the city of Prague is very ill-built, it is pleasantly situated, and some of the prospects are beautiful, and the gardens and pleasure-houses are excellent. The people, Riefbeck informs us, enjoy sensual pleasures more than those of Vienna, because they know better how to connect mental enjoyments with them. The numerous garrison kept in the place (9000 men) contributes much to its gaiety and liveliness.

PRAM, or PRAME, a kind of lighter used in Holland and the ports of the Baltic Sea, to carry the cargo of a merchant-ship *along-side*, in order to lade or to bring it to shore to be lodged in the storehouses after being discharged out of the vessel.

PRAME, in military affairs, a kind of floating battery, being a flat-bottomed vessel, which draws little water, mounts several guns, and is very useful in covering the disembarkation of troops. They are generally made use of in transporting troops over the lakes in America.

PRAMNION, in natural history, the name of a semipellucid gem. This is a very singular stone, and of a very great concealed beauty. The lapidaries, when they meet with it, call it by the name of the *black agate*. It is of an extremely close, compact, and firm texture, of a smooth and equal surface, and in shape very irregular, being sometimes round, sometimes oblong, and often flat; in size it seldom exceeds two inches. It appears, on a common inspection, to be of a fine deep black; but held up against the sun or the light of a candle, it is an elegant red, clouded by a quantity of subtle black earth. It is brought from the East Indies.

PRASIUM, in botany: A genus of the gymnospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 42d order, *Verticillata*. There are four monospermous berries.

PRATINAS, a Greek poet contemporary with Æschylus, born at Phlius. He was the first among the Greeks who composed satires, which were represented as farces. Of these 32 were acted, as also 18 of his tragedies, one of which only obtained the poetical prize. Some of his verses are extant, quoted by Athenæus.

PRATIQUE, or PRATTIC, in commerce, a negotiation or communication of commerce which a merchant-vessel obtains in the port it arrives in and the countries it discovers: hence to obtain a pratique, is to obtain liberty to frequent a port, to go ashore, to buy and sell, &c.

PRATT (Charles), earl of Camden, was the third son of Sir John Pratt, knight, chief-justice of the court of king's-bench under George I. by his second wife Elizabeth, daughter of the Reverend Hugh Wilson canon of Bangor and was born in 1713, the year before his father was called to the honour of the bench. He received the first rudiments of his education at Eton,

Pratt.

and afterwards removed to king's college Cambridge. Of his early life at both places there is little known, other than that at college he was found to be remarkably diligent and studious, and particularly so in the history and constitution of his country. By some he was thought to be a little too tenacious of the rights and privileges of the college he belonged to: but perhaps it was to this early tendency that we are indebted for those noble struggles in defence of liberty, which, whether in or out of office, he displayed through the whole course of his political life. After staying out the usual time at college, and taking his master's degree, in 1739 he entered himself a student of the Inner Temple, and was in due time admitted by that honourable society as a barrister at law. And here a circumstance develops itself in the history of this great man, which shows how much chance governs in the affairs of this world, and that the most considerable talents and indisputable integrity will sometimes require the introduction of this mistress of the ceremonies, in order to obtain that which they ought to possess from their own intrinsic qualifications.

Mr Pratt, after his being called to the bar, notwithstanding his family introduction, and his own personal character, was very near nine years in the profession, without ever getting in any degree forward. Whether this arose from a natural timidity of constitution, ill-luck, or perhaps a mixture of despondence growing out of the two circumstances, it is now difficult to tell; but the fact was so: and he was so dispirited by it, that he had some thoughts of relinquishing the profession of the law, and retiring to his college, where, in rotation, he might be sure of a church living, that would give him a small but honourable independence. With these melancholy ideas he went as usual the western circuit, to make one more experiment, and then to take his final determination. Mr Henly, afterwards Lord Northington and chancellor of England, was in the same circuit: he was Mr Pratt's most intimate friend; and he now availed himself of that friendship, and told him his situation, and his intentions of retiring to the university and going into the church. He opposed his intention with strong raillery, and got him engaged in a cause along with himself; and Mr Henley being ill, Mr Pratt took the lead, and displayed a professional knowledge and elocution that excited the admiration of his brother barristers as much as that of the whole court. He gained his cause; and besides, he acquired the reputation of an eloquent, profound, and constitutional lawyer. It was this circumstance, together with the continued good offices of his friend Henley, which led to his future greatness; for with all his abilities and all his knowledge, he might otherwise in all probability have passed his life in obscurity unnoticed and unknown.

He became now one of the most successful pleaders at the bar, and honours and emoluments flowed thick upon him. He was chosen to represent the borough of Downton, Wilts, after the general election in 1759; recorder of Bath 1759; and the same year was appointed attorney-general; in January 1762 he was called to the degree of serjeant at law, appointed chief-justice of the common pleas, and knighted. His lordship presided in that court with a dignity, weight and impartiality, never exceeded by any of his predecessors; and when John Wilkes, Esq; was seized and committed to the Tower on an illegal general

Pratt. general warrant, his Lordship with the intrepidity of a British magistrate, and the becoming fortitude of an Englishman, granted him an *habeas corpus*; and on his being brought before the court of common pleas, discharged him from his confinement in the Tower, May 6. 1763, in a speech which did him honour. His wife and spirited behaviour on this remarkable occasion, so interesting to every true-born Briton, and in the consequent judicial proceedings between the printers of The North Briton and the messengers and others, was so acceptable to the nation, that the city of London presented him with the freedom of their corporation in a gold box, and desired his picture, which was put up in Guildhall, with this inscription :

HANC ICONEM
CAROLI PRATT, EQ.
SUMMI JUDICIS C. B.
IN HONOREM TANTI VIRI,
ANGLICÆ LIBERTATIS LEGE
ASSERTORIS,
S. P. Q. L.
IN CURIA MUNICIPALI
PONI JUSSERVNT
NONO KAL. MART. A. D. MDCCLXIV.
GULIELMO BRIDGEN, AR. PRÆ. VRB.

This portrait, painted by Reynolds, was engraved by Baire. The corporations of Dublin, Bath, Exeter, and Norwich, paid him the like compliment; and in a petition entered in the journals of the city of Dublin, it was declared, that no man appeared to have acquitted himself in his high station with such becoming zeal for the honour and dignity of the crown, and the fulfilling his majesty's most gracious intentions for preserving the freedom and happiness of his subjects, and such invincible fortitude in administering justice and law, as the Right Honourable Sir Charles Pratt, knight, the present lord-chief-justice of his majesty's court of common pleas in England, has shown in some late judicial determinations which must be remembered to his lordship's honour while and wherever British liberties are held sacred.

Higher honours, however, than the breath of popular applause awaited Sir Charles Pratt. On the 16th of July 1765 he was created a peer of Great Britain, by the style and title of Lord Camden, Baron Camden, in the county of Kent; and July 30. 1766. on the resignation of Robert earl of Northington, he was appointed lord high-chancellor of Great Britain; in which capacity he, in a speech of two hours, declared, upon the first decision of the suit against the messengers who arrested Mr Wilkes, that "it was the unanimous opinion of the whole court, that general warrants, except in cases of high treason, were illegal, oppressive, and unwarrantable. He conducted himself in this high office so as to obtain the love and esteem of all parties; but when the taxation of America was in agitation, he declared himself against it, and strongly opposing it, was removed from his station in 1770.

Upon the fall of Lord North he was again taken into the administration, and on the 27th of March 1782 appointed president of the council; an office which he resigned in March 1783. On the 13th of May 1786, he was created Viscount Bayham of Bayham abbey Kent, and Earl Camden.

Whether we consider Earl Camden as a *statesman*, called to that high situation by his talents; as a *lawyer*,

defending, supporting, and enlarging the constitution; or as a *man* sustaining both by his firmness and unshaken integrity—in all he excites our general praise; and when we contemplate his high and exalted virtue, we must allow him to have been an honour to his country. He died on the 18th of April 1794 at his house in Hill-street, Berkeley-square, being at that time president of his majesty's most honourable privy-council, a governor of the charter-house, recorder of the city of Bath, and F. R. S.

He married Elizabeth, daughter and coheir of Nicholas Jafferys, Esq; son and heir of Sir Jeffery Jafferys of Brecknock priory, knight, who died in December 1779, and by whom he had issue John Jafferys Pratt (now Lord Camden), born 1759, M. P. for Bath, commissioner of the admiralty, 1782, resigned and re-appointed 1783; and four daughters, Frances, married, 1775, Robert Stewart, Esq; of Mount Stewart, county of Down, 1779, and M. P. for that county; Elizabeth, single; Sarah, married Nicholas Saintfield, Esq; county of Down, 1779; Jane, married 1780 William Head James, Esq; son and heir of Sir F. Head of Langley, county of Bucks. His seat at Camden place, Chiffelhurst, was the residence of the great William Camden; on whose death it came by several intermediate owners to Weston, Spencer, and Pratt, and was much improved by his Lordship. His remains were interred in the family burying-place at Seal, in Kent.

PRAXAGORAS, a native of Athens, at 19 years of age composed the History of the Kings of Athens, in two books; and at 22 the Life of Constantine the Great, in which, though a pagan, he speaks very advantageously of that prince. He also wrote the History of Alexander the Great. He lived under Constantius about the year 345.

PRAXITELES, a very famous Greek sculptor, who lived 330 years before Christ, at the time of the reign of Alexander the Great. All the ancient writers mention his statues with a high commendation, especially a Venus executed by him for the city of Cnidos, which was so admirable a piece, that king Nicomedes offered to release the inhabitants from their tribute at the purchase of it; but they refused to part with it. The inhabitants of the isle of Cos requested of Praxiteles a statue of Venus; and in consequence of this application the artist gave them their choice of two; one of which represented the goddess entirely naked, and the other covered with drapery. Both of these were of exquisite workmanship; although the former was esteemed the most beautiful, nevertheless the inhabitants of Cos had the wisdom to give the preference to the latter, from a conviction that no motive whatever could justify their introducing into their city any indecent statues or paintings, which are so likely to inflame the passions of young people, and lead them to immorality and vice. What a reproach will this be to many Christians!—He was one of the gallants of Phryne the celebrated courtesan.

PRAYER, a solemn address to God, which, when it is of any considerable length, consists of *adoration*, *confession*, *supplication*, *intercession*, and *thanksgiving*.

By *adoration* we express our sense of God's infinite perfections, his power, wisdom, goodness, and mercy; and acknowledge that our constant dependence is upon Him by whom the universe was created and has been

Pratt
||
Prayer.

Prayer.

hitherto preferred. By *confession* is meant our acknowledgment of our manifold transgressions of the divine laws, and our consequent unworthiness of all the good things which we enjoy at present or expect to be conferred upon us hereafter. In *supplication* we intreat our omnipotent Creator and merciful Judge, not to deal with us after our iniquities, but to pardon our transgressions, and by his grace to enable us to live henceforth righteously, soberly, and godly, in this present world; and by Christians this intreaty is always made in the name and through the mediation of Jesus Christ, because to them it is known that there is none other name under heaven given unto men whereby they may be saved. To these supplications for mercy we may likewise add our prayers for the necessities of life; because if we seek *first* the kingdom of God and his righteousness, we are assured that such things shall be added unto us. *Intercession* signifies those petitions which we offer up for others, for friends, for enemies, for all men, especially for our lawful governors, whether supreme or subordinate. And *thanksgiving* is the expression of our gratitude to God, the giver of every good and perfect gift, for all the benefits enjoyed by us and others, for the means of grace, and for the hope of glory. Such are the component parts of a regular and solemn prayer, adapted either for the church or for the closet. But an ejaculation to God, conceived on any emergency, is likewise a prayer, whether it be uttered by the voice or suffered to remain a mere affection of the mind; because the Being to whom it is addressed discerneth the thoughts of the heart.

That prayer is a duty which all men ought to perform with humility and reverence, has been generally acknowledged as well by the untaught barbarian as by the enlightened Christian; and yet to this duty objections have been made by which the understanding has been bewildered in sophistry and affronted with jargon. "If God be independent, omnipotent, and possessed of every other perfection, what pleasure, it has been asked, can he take in our acknowledgment of these perfections? If he knows all things past, present, and future, where is the propriety of our confessing our sins unto him? If he is a benevolent and merciful Being, he will pardon our sins, and grant us what is needful for us without our supplications and intreaties; and if he be likewise possessed of infinite wisdom, it is certain that no importunities of ours will prevail upon him to grant us what is improper, or for our sakes to change the equal and steady laws by which the world is governed.

"Shall burning *Ætna*, if a sage requires,
 "Forget to thunder, and recal her fires?
 "On a r or sea new motions be imprest,
 "Oh blameless Bethel! to relieve thy breast?
 "When the loose mountain trembles from on high,
 "Shall gravitation cease, if you go by?
 "Or some old temple, nodding to its fall,
 "For Chartres' head reserve the hanging wall*?"

Such are the most plausible objections which are usually made to the practice of prayer; and though they have been set off with all the art of the metaphysical wrangler, and embellished with all the graces of the poetry of Pope, they appear to us such gross sophisms as can operate only on a very unthinking head, or on a very corrupt heart. For if God certainly ex-

ists, and there is not a mathematical theorem capable of more rigid demonstration, it is obvious that no man can think of such a being without having his mind strongly impressed with the conviction of his own constant dependence upon him; nor can he "contemplate the heavens, the work of God's hands, the moon, and the stars which he has ordained," without forming the most sublime conceptions that he can of the Divine power, wisdom, and goodness, &c. But such conviction, and such conceptions, whether clothed in words or not, are to all intents and purposes what is meant by adoration; and are as well known to the Deity while they remain the silent affections of the heart, as after they are spoken in the beginning of a prayer. Our adoration, therefore, is not expressed for the purpose of giving information to God, who understandeth our thoughts afar off; but merely, when the prayer is private, because we cannot think any more than speak without words, and because the very *sound* of words that are well chosen affects the heart, and helps to fix our attention: and as the Being who sees at once the past, present, and to come, and to whom a thousand years are but as one day, stands not in need of our information; so neither was it ever supposed by a man of rational piety, that he takes pleasure on his *own* account in hearing his perfections enumerated by creatures of yesterday; for being independent, he has no passions to be gratified, and being self-sufficient, he was as happy when existing alone as at that moment "when the morning stars sang together, and all the sons of God shouted for joy." Adoration is therefore proper only as it tends to preserve in our minds just notions of the Creator and Governor of the world, and of our own constant dependence upon him; and if such notions be useful to ourselves, who have a part to act in the scale of existence, upon which our happiness depends (a proposition which no theist will controvert), adoration must be acceptable to that benevolent God, who, when creating the world, could have no other end in view than to propagate happiness. See METAPHYSICS, n° 312.

By the same mode of reasoning, it will be easy to show the duty of *confession* and *supplication*. We are not required to confess our sins unto God, because he is ignorant of them; for he is ignorant of nothing. If he were, no reason could be assigned for our divulging to our judge actions deserving of punishment. Neither are we required to cry for mercy, in order to move him in whom there is no variableness, neither shadow of turning. The Being that made the world, governs it by laws that are inflexible, because they are the best; and to suppose that he can be induced by prayers, oblations, or sacrifices, to vary his plan of government, is an impious thought, which degrades the Deity to a level with man. One of these inflexible laws is the connection established between certain dispositions of mind and human happiness. We are enjoined to pursue a particular course of conduct under the denomination of virtue, not because our virtuous actions can in any degree be of advantage to him by whom we were created, but because they necessarily generate in our own minds those dispositions which are essential to our ultimate happiness. A man of a malignant, arrogant, or sensual disposition, would have no enjoyment in that heaven, where all are actuated by a spirit of love and purity; and it is doubtless for this reason among others, that the Christian religion prohibits

Prayer.

* Essay on
 Man.

Prayer.

prohibits malice, arrogance, and sensuality, among her votaries, and requires the cultivation of the opposite virtues. But a person who has deviated far from his duty cannot think of returning, unless he be previously convinced that he has gone astray. Such conviction, whenever he obtains it, will necessarily impress upon his mind a sense of his own danger, and fill his heart with sorrow and remorse for having transgressed the laws established by the most benevolent of all Beings for the propagation of universal felicity. This conviction of error, this sense of danger, and this compunction for having transgressed, are all perceived by the deity as soon as they take place in the mind of the sinner; and he is required to *confess* his sins, only because the act of confession tends to imprint more deeply on his mind his own unworthiness, and the necessity of returning immediately into the paths of that virtue of which all the ways are pleasantness and all the paths are peace.

In the objection, it is taken for granted, that if God be a benevolent and merciful Being, he will pardon our sins, and grant us what is needful for us, whether we supplicate him or not: but this is a gross and palpable mistake, arising from the objector's ignorance of the end of virtue and the nature of man. Until a man be sensible of his sins and his danger, he is for the reason already assigned incapable of pardon, because his disposition is incompatible with the happiness of the blessed. But whenever he acquires this conviction it is impossible for him not to form a *mental wish* that he may be pardoned; and this wish being perceptible to the all-seeing eye of his Judge, forms the sum and substance of a supplication for mercy. If he clothe it in words, it is only for a reason similar to that which makes him adore his Creator and confess his sins in words, that just notions may be more deeply imprinted on his own mind. The same reasoning holds good with respect to those prayers which we put up for temporal blessings, for protection and support in our journey through life. We are told by high authority, that "the Lord is nigh unto all them that call upon him, to all that call upon him in truth." This, however, is not because he is attracted or delighted by their prayers and intreaties, but because those prayers and intreaties fit such as offer them for receiving those benefits which he is at all times ready to pour upon all mankind. In his essence God is equally present with the righteous and with the wicked, with those who pray, and with those who pray not; for "the eyes of the Lord are in every place beholding the evil and the good." But as the atmosphere equally surrounds every person upon this globe, and yet in its state of greatest purity does not affect the asthmatic as it affects those who are whole; so the Divine presence, though essentially the same everywhere, yet does not protect the impious as it protects the devout, because the impious are not in a state capable of the Divine protection. The end for which God requires the exercise of prayer as a duty, is not his benefit but ours; because it is a mean to generate in the petitioner such a disposition of mind as must render him a special object of that love and that providential care which extend over the whole creation.

That part of the objection which results from the consideration of the fixed laws of nature, and which the poet has so finely illustrated, presents, it must be confessed, considerable difficulties; but none which to us ap-

pear insurmountable. If, indeed, we suppose that in the original constitution of things, when the laws of nature were established, a determinate duration was given to the top of the mountain and the nodding temple, without any regard to foreseen consequences, it would undoubtedly be absurd and perhaps impious to expect the law of gravitation to be suspended by the prayers of a good man, who should happen to be passing at the instant decreed for the fall of these objects. But of such a constitution there is so far from being evidence, that it appears not to be consistent with the wisdom and goodness of the Author of nature. This world was undoubtedly formed for the habitation of man and of other animals. If so, we must necessarily suppose, that in the establishing of the laws of Nature, God adjusted them in such a manner as he saw would best serve the accommodation of those sentient beings for whose accommodation alone they were to be established. Let it then be admitted, that all the human beings who were ever to exist upon this globe, with all their thoughts, words, and actions, were at that important moment present to the divine intellect, and it surely will not be impossible to conceive, that in consequence of the foreseen danger and prayers of a good man, the determinate duration of the mountain and the tower might be either lengthened or shortened to let him escape. This idea of providence, and of the efficacy of prayer, is thus illustrated by Mr W. Maistron*. "Suppose M (some man) certainly to *foreknow*, by some means or other, that, when he should come to be upon his death-bed, L would *petition* for some *particular legacy*, in a manner so earnest and humble, and with such a good disposition, as would render it proper to grant his request: and upon this, M makes his *last will*, by which he devises to L that which was to be asked, and then locks up the *will*; and all this many years before the death of M, and whilst L had yet no expectation or thought of any such thing. When the time comes, the *petition* is made and *granted*; not by making any *new will*, but by the old one already made, and without alteration: which legacy had, notwithstanding that, never been left, had the petition never been preferred. The grant may be called the effect of a future act, and depends as much upon it as if it had been made after the act. So, if it had been foreseen, that L would not *so much as ask*, and he had been therefore left out of the will, this *præterition* would have been caused by his carriage, though much later than the date of the will. In all this nothing is hard to be admitted, if M be allowed to foreknow the case. And thus the *prayers* which good men offer to the *all-knowing* God, and the *neglect of prayers* by others, may find fitting effects *already* forecasted in the course of nature."

This solution of the difficulty presents indeed to the mind a prodigious scheme, in which all things to come are, as it were, comprehended under one view, and estimated and compared together. But when it is considered what a mass of wonders the universe is in other respects; what an incomprehensibly great and perfect Being God is; that he cannot be ignorant of any thing, no not of the future wants and deportments of particular men; and that all things which derive their existence from him must be consistent with one another—it must surely be confessed that such an adjustment of physical causes to moral volitions is within the compass of infinite power and perfect wisdom.

* Religion of Nature delineated.

To

Prayer.

† Mr Paley.

To that part of a prayer which we have termed intercession, it has been objected, that "to intercede for others is to presume that we possess an interest with the Deity upon which their happiness and even the prosperity of whole communities depends." In answer to this objection, it has been observed by an ingenious and useful writer †, that "how unequal soever our knowledge of the divine economy may be to a complete solution of this difficulty, which may require a comprehension of the entire plan, and of all the ends of God's moral government, to explain it satisfactorily, we can yet understand one thing concerning it, that it is, after all, nothing more than the making of one man the instrument of happiness and misery to another; which is perfectly of a piece with the course and order that obtain, and which we must believe were intended to obtain in human affairs. Why may we not be assisted by the prayers of other men, as well as we are beholden for our support to their labour? Why may not our happiness be made in some cases to depend upon the intercession as it certainly does in many upon the good offices of our neighbours? The happiness and misery of great numbers we see oftentimes at the disposal of one man's choice, or liable to be much affected by his conduct: what greater difficulty is there in supposing, that the prayers of an individual may avert a calamity from multitudes, or be accepted to the benefit of whole communities?"

These observations may perhaps be sufficient to remove the force of the objection, but much more may be said for the practice of mutual intercession. If it be one man's duty to intercede for another, it is the duty of that other to intercede for him; and if we set aside the particular relations which arise from blood, and from particular stations in society, mutual intercession must be equally the duty of all mankind. But there is nothing (we speak from our own experience, and appeal to the experience of our readers) which has so powerful a tendency to generate in the heart of any person good-will towards another as the constant practice of praying to God for his happiness. Let a man regularly pray for his enemy with all that seriousness which devotion requires, and he will not long harbour resentment against him. Let him pray for his friend with that ardour which friendship naturally inspires, and he will perceive his attachment to grow daily and daily stronger. If, then, universal benevolence, or charity, be a disposition which we ought to cultivate in ourselves, mutual intercession is undeniably a duty, because nothing contributes so effectually to the acquisition of that spirit which an apostle terms the end of the commandment.

When it is said, that by interceding for kings, and all in authority, we seem to consider the prosperity of communities as depending upon our interest with God, the objector mistakes the nature and end of these intercessions. In the prosperity of any community consists great part of the happiness of its individual members; but that prosperity depends much upon the conduct of its governors. When, therefore, individuals intercede for their governors, the ultimate object of their prayers must be conceived to be their own good. As it is equally the duty of all the members of the community to pray for their governors, such intercessions are the prayers of the whole community for itself, and of every individual for himself. So that in this view of the case, the most just, we apprehend, that can be taken of it,

it is not true that supplications and intercessions for kings and all in authority are the prayers of one individual for another, but the prayers of many individuals for that body of which each of them knows himself to be a member.

Having evinced the duty of adoration, confession, supplication, and intercession, we need not surely waste our reader's time with a formal and laboured vindication of thanksgiving. Gratitude for benefits received is so universally acknowledged to be a virtue, and ingratitude is so detestable a vice, that no man who lays claim to a moral character will dare to affirm that we ought not to have a just sense of the goodness of God in preserving us from the numberless dangers to which we are exposed, and "in giving us rain from heaven, and fruitful seasons, filling our hearts with food and gladness." But if we have this sense, whether we express it in words or not, we offer to God thanksgiving; because every movement of the heart is open and exposed to his all-seeing eye.

In this article we have treated of prayer in general, and as the private duty of every individual; but there ought to be *public* as well as *private* prayer, which shall be considered afterwards. (See WORSHIP.) We have likewise observed, that the prayers of every Christian ought to be offered in the name and through the mediation of Jesus Christ, for which the reason will be seen in the article THEOLOGY. We shall conclude our reflections on the general duty, with observing, that nothing so forcibly restrains from ill as the remembrance of a recent address to heaven for protection and assistance. After having petitioned for power to resist temptation, there is so great an incongruity in not continuing the struggle, that we blush at the thought, and persevere lest we lose all reverence for ourselves. After fervently devoting our souls to God, we start with horror at immediate apostacy: every act of deliberate wickedness is then complicated with hypocrisy and ingratitude: it is a mockery of the Father of Mercies, the forfeiture of that peace in which we closed our address, and a renunciation of the hope which that address inspired. But if prayer and immorality be thus incompatible, surely the former should not be neglected by those who contend that moral virtue is the summit of human perfection.

PREACHING. See DECLAMATION, ART. I.—The word is derived from the Hebrew *paraſch, expofuit*, "he expounded."

PREADAMITE, a denomination given to the inhabitants of the earth, conceived, by some people, to have lived before Adam.

Isaac de la Pereyra, in 1655, published a book to evince the reality of Preadamites, by which he gained a considerable number of profelytes to the opinion: but the answer of Demarets, professor of theology at Groningen, published the year following, put a stop to its progress; though Pereyra made a reply.

His system was this: The Jews he calls *Adamites*, and supposes them to have issued from Adam; and gives the title *Preadamites* to the Gentiles, whom he supposes to have been a long time before Adam. But this being expressly contrary to the first words of Genesis, Pereyra had recourse to the fabulous antiquities of the Egyptians and Chaldeans, and to some idle rabbins, who imagined there had been another world before that described.

Prayer
|
Preada-
mite.

Preamble described by Moses. He was apprehended by the inquisition in Flanders, and very roughly used, though in the service of the dauphin. But he appealed from their sentence to Rome; whither he went in the time of Alexander VII. and where he printed a retraction of his book of Preadamites. See **PRE-EXISTENCE**.

||
Precept.

PREAMBLE, in law, the beginning of an act of a legislature, &c. which serves to open the intent of the act, and the mischiefs intended to be remedied by it.

PREBEND, the maintenance a prebendary receives out of the estate of a cathedral or collegiate church. Prebends are distinguished into simple and dignitary: a simple prebend has no more than the revenue for its support; but a prebend with dignity has always a jurisdiction annexed to it.

PREBENDARY, an ecclesiastic who enjoys a prebend.

The difference between a prebendary and a canon is, that the former receives his prebend in consideration of his officiating in the church, but the latter merely by his being received into the cathedral or college.

PRECARIUM, in Scots law. See **LAW**, N° clxxiii. 9.

PRECEDENCE, in Europe, a place of honour to which a person is entitled. This is either of courtesy or of right. The former is that which is due to age, estate, &c. which is regulated by custom and civility: the latter is settled by authority; and when broken in upon gives an action at law.

In Great Britain, the order of precedency is as follows: The king; the princes of the blood; the archbishop of Canterbury; the lord high chancellor; the archbishop of York; the lord treasurer of England; the lord president of the council; the lord privy seal; dukes; the eldest sons of dukes of the blood royal; marquesses; dukes eldest sons; earls; marquesses eldest sons; dukes younger sons; viscounts; earls eldest sons; marquesses younger sons; bishops; barons; speaker of the house of commons; lord commissioner of the great seal; viscounts eldest sons; earls younger sons; barons eldest sons; privy counsellors not peers; chancellor of the exchequer; chancellor of the duchy; knights of the garter not peers; lord chief justice of the king's bench; master of the rolls; lord chief justice of the common pleas; lord chief baron of the exchequer; puisne judges and barons; knights banneret, if made in the field; masters in chancery; viscounts younger sons; barons younger sons; baronets; knights banneret; knights of the Bath; knights bachelors; baronets eldest sons; knights eldest sons; baronets younger sons; knights younger sons; field and flag officers; doctors graduate; serjeants at law; esquires; gentlemen bearing coat armour; yeomen; tradesmen; artificers; labourers.—*Note*, The ladies, except those of archbishops, bishops, and judges, take place according to the degree of quality of their husbands; and unmarried ladies take place according to that of their fathers.

PRECEDENT, in law, a case which has been determined, and which serves as a rule for all of the same nature.

PRECENTOR, a dignity in cathedrals, popularly called the *chanter*, or *master of the choir*.

PRECEPT, in law, a command in writing sent by a chief justice or justice of the peace, for bringing a person, record, or other matter before him.

PRECEPT of *Clare Constat* in Scots law. See **LAW**, **Precept** Part III. n° clxxx. 28.

PRECEPT of *Seisin*, in Scots law. See **LAW**, Part III. **Precession**, n° clxix. 16.

PRECEPTIVE, any thing which gives or contains precepts.

PRECEPTIVE Poetry. See **POETRY** n° 146, &c.

PRECESSION OF THE EQUINOXES. The most obvious of all the celestial motions is the diurnal revolution of the starry heavens. The whole appears to turn round an imaginary **AXIS**, which passes through two opposite points of the heavens, called the *poles*. One of these is in our sight, being very near the star and in the tail of the little bear. The great circle which is equidistant from both poles divides the heavens into the northern and southern hemispheres, which are equal. It is called the *equator*, and it cuts the horizon in the east and west points, and every star in it is 12 sidereal hours above and as many below the horizon, in each revolution.

The sun's motions determine the length of day and night, and the vicissitudes of the seasons. By a long series of observations, the shepherds of Asia were able to mark out the sun's path in the heavens; he being always in the opposite point to that which comes to the meridian at midnight, with equal but opposite declination. Thus they could tell the stars among which the sun then was, although they could not see them.

They discovered that his path was a great circle of the heavens, afterward called the **ECLIPTIC**; which cuts the Equator in two opposite points, dividing it, and being divided by it, into two equal parts. They farther observed, that when the sun was in either of these points of intersection, his circle of diurnal revolution coincided with the equator, and therefore the days and nights were equal. Hence the equator came to be called the **EQUINOCTIAL LINE**, and the points in which it cuts the ecliptic were called the **EQUINOCTIAL POINTS**, and the sun was then said to be in the equinoxes. One of these was called the **VERNAL** and the other the **AUTUMNAL EQUINOX**.

It was evidently an important problem in practical astronomy to determine the exact moment of the sun's occupying these stations; for it was natural to compute the course of the year from that moment. Accordingly this has been the leading problem in the astronomy of all nations. It is susceptible of considerable precision, without any apparatus of instruments. It is only necessary to observe the sun's declination on the noon of two or three days before and after the equinoctial day. On two consecutive days of this number, his declination must have changed from north to south, or from south to north. If his declination on one day was observed to be 21' north, and on the next 5' south, it follows that his declination was nothing, or that he was in the equinoctial point about 23 minutes after 7 in the morning of the second day. Knowing the precise moments, and knowing the rate of the sun's motion in the ecliptic, it is easy to ascertain the precise point of the ecliptic in which the equator intersected it.

By a series of such observations made at Alexandria between the years 161 and 127 before Christ, Hipparchus the father of our astronomy found that the point of the autumnal equinox was about six degrees to the eastward of the star called **SPICA VIRGINIS**. Eager to determine

Precession. determine every thing by multiplied observations, he racked all the Chaldean, Egyptian, and other records, to which his travels could procure him access, for observations of the same kind; but he does not mention his having found any. He found, however, some observations of Aristillus and Timochares made about 150 years before. From these it appeared evident that the point of the autumnal equinox was then about eight degrees east of the same star. He discusses these observations with great sagacity and rigour; and, on their authority, he asserts that the equinoctial points are not fixed in the heavens, but move to the westward about a degree in 75 years or somewhat less.

5 Why called the precession of the equinoxes. This motion is called the PRECESSION OF THE EQUINOXES, because by it the time and place of the sun's equinoctial station precedes the usual calculations: it is fully confirmed by all subsequent observations. In 1750 the autumnal equinox was observed to be $20^{\circ} 21'$ westward of spica virginis. Supposing the motion to have been uniform during the period of ages, it follows that the annual precession is about $50''\frac{1}{2}$; that is, if the celestial equator cuts the ecliptic in a particular point on any day of this year, it will on the same day of the following year cut it in a point $50''\frac{1}{2}$ to the west of it, and the sun will come to the equinox $20' 23''$ before he has completed his round of the heavens. Thus the equinoctial or tropical year, or true year of seasons, is so much shorter than the revolution of the sun or the sidereal year.

6 Importance of the discovery. It is this discovery that has chiefly immortalized the name of Hipparchus, though it must be acknowledged that all his astronomical researches have been conducted with the same sagacity and intelligence. It was natural therefore for him to value himself highly for the discovery. It must be acknowledged to be one of the most singular that has been made, that the revolution of the whole heavens should not be stable, but its axis continually changing. For it must be observed, that since the equator changes its position, and the equator is only an imaginary circle, equidistant from the two poles or extremities of the axis; these poles and this axis must equally change their positions. The equinoctial points make a complete revolution in about 25745, the equator being all the while inclined to the ecliptic in nearly the same angle. Therefore the poles of this diurnal revolution must describe a circle round the poles of the ecliptic at the distance of about $23\frac{1}{2}^{\circ}$ degrees in 25745 years; and in the time of Timochares the north pole of the heavens must have been 30 degrees eastward of where it now is.

7 Hipparchus has been accused of plagiarism. Hipparchus has been accused of plagiarism and insincerity in this matter. It is now very certain that the precession of the equinoxes was known to the astronomers of India many ages before the time of Hipparchus. It appears also that the Chaldeans had a pretty accurate knowledge of the year of seasons. From their fables we deduce their measure of this year to be 365 days 5 hours 49 minutes and 11 seconds, exceeding the truth only by $26''$, and much more exact than the year of Hipparchus. They had also a sidereal year of 365 days 6 hours 11 minutes. Now what could occasion an attention to two years, if they did not suppose the equinoxes moveable? The Egyptians also had a knowledge of something equivalent to this: for they had discovered that the dog star was no longer the faithful fore-warner of the overflowing of the Nile; and they com-

bined him with the star Fomalhafet* in their mystical Precession, kalendar. This knowledge is also involved in the precepts of the Chinese astronomy, of much older date than the time of Hipparchus.

But all these acknowledged facts are not sufficient for depriving Hipparchus of the honour of the discovery, or fixing on him the charge of plagiarism. This motion was a thing unknown to the astronomers of the Alexandrian school, and it was pointed out to them by Hipparchus in the way in which he ascertained every other position in astronomy, namely, as the mathematical result of actual observations, and not as a thing deducible from any opinions on other subjects related to it. We see him, on all other occasions, eager to confirm his own observations and his deductions from them, by every thing he could pick up from other astronomers; and he even adduced the abovementioned practice of the Egyptians in corroboration of his doctrine. It is more than probable then that he did not know any thing more. Had he known the Indian precession of $54''$ annually, he had no temptation whatever to withhold him from using it in preference to one which he acknowledges to be inaccurate, because deduced from the very short period of 150 years, and from the observations of Timochares, in which he had no great confidence.

This motion of the starry heavens was long a matter of discussion, as a thing for which no physical reason could be assigned. But the establishment of the Copernican system reduced it to a very simple affair; the motion which was thought to affect all the heavenly bodies, is now acknowledged to be a deception, or a false judgment from the appearances. The earth turns round its own axis while it revolves round the sun, in the same manner as we may cause a child's top to spin on the brim of a mill-stone, while the stone is turning slowly round its axis. If the top spin steadily, without any wavering, its axis will always point to the zenith of the heavens; but we frequently see, that while it spins briskly round its axis, the axis itself has a slow conical motion round the vertical line, so that, if produced, it would slowly describe a circle in the heavens round the zenith point. The flat surface of the top may represent the terrestrial equator, gradually turning itself round on all sides. If this top were formed like a ball, with an equatorial circle on it, it would represent the whole motion very prettily, the only difference being, that the spinning motion and this wavering motion are in the same direction; whereas the diurnal rotation and the motion of the equinoctial points are in contrary directions. Even this dissimilarity may be removed, by making the top turn on a cap, like the card of a mariner's compass.

It is now a matter fully established, that while the earth revolves round the sun from west to east, in the plane of the ecliptic, in the course of a year it turns round its own axis from west to east in $23\text{h } 56' 4''$, which axis is inclined to this plane in an angle of nearly $23^{\circ} 28'$; and that this axis turns round a line perpendicular to the ecliptic in 25,745 years from east to west, keeping nearly the same inclination to the ecliptic.—By this means, its pole in the sphere of the starry heavens describes a circle round the pole of the ecliptic at the distance of $23^{\circ} 28'$ nearly. The consequence of this must be, that the terrestrial equator, when produced

* See Dupins sur le zodiaque des Egyptiens, Mem. de l'Acad. des Inscrip. 8 But falsely.

9 Heavenly motions accounted for by the Copernican system.

10 And the earth's.

Precession. ced to the sphere of the starry heavens, will cut the ecliptic in two opposite points, through which the sun must pass when he makes the day and night equal; and that these points must shift to the westward, at the rate of $50\frac{1}{2}$ seconds annually, which is the precession of the equinoxes. Accordingly this has been the received doctrine among astronomers for nearly three centuries, and it was thought perfectly conformable to appearances.

11
Bradley's attempt to discover the parallax of the earth's orbit.

But Dr Bradley, the most sagacious of modern astronomers, hoped to discover the parallax of the earth's orbit by observations of the actual position of the pole of the celestial revolution. Dr Hooke had attempted this before, but with very imperfect instruments. The art of observing being now prodigiously improved, Dr Bradley resumed this investigation. It will easily appear, that if the earth's axis keeps parallel to itself, its extremity must describe in the sphere of the starry heavens a figure equal and parallel to its orbit round the sun; and if the stars be so near that this figure is a visible object, the pole of diurnal revolution will be in different distinguishable points of this figure. Consequently, if the axis describes the cone already mentioned, the pole will not describe a circle round the pole of the ecliptic, but will have a looped motion along this circumference, similar to the absolute motion of one of Jupiter's satellites, describing an epicycle whose centre describes the circle round the pole of the ecliptic.

12
Difficulties in the attempt observed by accident.

He accordingly observed such an epicyclical motion, and thought that he had now overcome the only difficulty in the Copernican system; but, on maturely considering his observations, he found this epicycle to be quite inconsistent with the consequences of the annual parallax, and it puzzled him exceedingly. One day, while taking the amusement of sailing about on the Thames, he observed, that every time the boat tacked, the direction of the wind, estimated by the direction of the vane, seemed to change. This immediately suggested to him the cause of his observed epicycle, and he found it an optical illusion, occasioned by a combination of the motion of light with the motion of his telescope while observing the polar stars. Thus he unwittingly established an incontrovertible argument for the truth of the Copernican system, and immortalized his name by his discovery of the ABERRATION of the stars.

13
His further investigation of the subject.

He now engaged in a series of observations for ascertaining all the circumstances of this discovery. In the course of these, which were continued for 28 years, he discovered another epicyclical motion of the pole of the heavens, which was equally curious and unexpected. He found that the pole described an epicycle, whose diameter was about $18''$, having for its centre that point of the circle round the pole of the ecliptic in which the pole would have been found independent of this new motion. He also observed, that the period of this epicyclical motion was 18 years and seven months. It struck him, that this was precisely the period of the revolution of the nodes of the moon's orbit. He gave a brief account of these results to Lord Macclesfield, then president of the Royal Society, in 1747. Mr Machin, to whom he also communicated the observations, gave him in return a very neat mathematical hypothesis, by which the motion might be calculated.

Plate
CCCCXIV

Let E (fig. 1.), be the pole of the ecliptic, and SPQ
VOL. XV.

a circle distant from it $23^{\circ} 28'$, representing the circle described by the pole of the equator during one revolution of the equinoctial points. Let P be the place of this last mentioned pole at some given time. Round P describe a circle ABCD, whose diameter AC is $18''$. The real situation of the pole will be in the circumference of this circle; and its place, in this circumference, depends on the place of the moon's ascending node. Draw EPF and GPL perpendicular to it; let GL be the colure of the equinoxes, and EF the colure of the solstices. Dr Bradley's observations showed that the pole was in A when the node was in L, the vernal equinox. If the node recede to H, the winter solstice, the pole is in B. When the node is in the autumnal equinox at G, the pole is at C; and when the node is in F, the summer solstice, the pole is in D. In all intermediate situations of the moon's ascending node, the pole is in a point of the circumference ABCD, three signs or 90° more advanced.

Dr Bradley, by comparing together a great number of observations, found that the mathematical theory, and the calculation depending on it, would correspond much better with the observations, if an ellipse were substituted for the circle ABCD, making the longer axis AC $18''$, and the shorter, BD, $16''$. Mr d'Alembert determined, by the physical theory of gravitation, the axes to be $18''$, and $13''$, 4.

These observations, and this mathematical theory, must be considered as so many facts in astronomy, and we must deduce from them the methods of computing the places of all celestial phenomena, agreeable to the universal practice of determining every point of the heavens by its longitude, latitude, right ascension, and declination.

It is evident, in the first place, that this equation of the pole's motion makes a change in the obliquity of the ecliptic. The inclination of the equator to the ecliptic is measured by the arch of a great circle intercepted between their poles. Now, if the pole be in O instead of P, it is plain that the obliquity is measured by EO instead of EP. If EP be considered as the mean obliquity of the ecliptic, it is augmented by $9''$ when the moon's ascending node is in the vernal equinox, and consequently the pole in A. It is, on the contrary, diminished $9''$ when the node is in the autumnal equinox, and the pole in C; and it is equal to the mean when the node is in the colure of the solstices. This change of the inclination of the earth's axis to the plane of the ecliptic was called the NUTATION of the axis by Sir Isaac Newton; who showed, that a change of nearly a second must obtain in a year by the action of the sun on the prominent parts of the terrestrial spheroid. But he did not attend to the change which would be made in this motion by the variation which obtains in the disturbing force of the moon, in consequence of the different obliquity of her action on the equator, arising from the motion of her own oblique orbit. It is this change which now goes by the name NUTATION, and we owe its discovery entirely to Dr Bradley. The general change of the position of the earth's axis has been termed DEVIATION by modern astronomers.

The quantity of this change of obliquity is easily ascertained. It is evident, from what has been already said, that when the pole is in O, the arch ADCO is equal

Precession

21
Equation
of longi-
tude from
nutations
of the earth's
axis.

But the nutation changes also the longitudes and right ascensions of the stars and planets by changing the equinoctial points, and thus occasioning an equation in the precession of the equinoctial points. It was this circumstance which made it necessary for us to consider it in this place, while expressly treating of this precession. Let us attend to this derangement of the equinoctial points.

The great circle or meridian which passes through the poles of the ecliptic and equator is always the solstitial colure, and the equinoctial colure is at right angles to it: therefore when the pole is in P or in O, EP or EO is the solstitial colure. Let S be any fixed star or planet, and let SE be a meridian or circle of longitude; draw the circles of declination PS, OS, and the circles M'EM', mEm', perpendicular to PE, OE.

If the pole were in its mean place P, the equinoctial points would be in the ecliptic meridian M'EM', or that meridian would pass through the intersections of the equator and ecliptic, and the angle MES would measure the longitude of the star S. But when the pole is in O, the ecliptic meridian mEm' will pass thro' the equinoctial points. The equinoctial points must therefore be to the westward of their mean place, and the equation of the precession must be additive to that precession; and the longitude of the star S will now be measured by the angle mES, which, in the case here represented, is greater than its mean longitude. The difference, or the equation of longitude, arising from the

nutations of the earth's axis, is the angle OEP, or $\frac{OM}{OE}$. OM is the sine of the angle CPO, which, by what has been already observed, is equal to the longitude of the node: Therefore OM is equal to $9'' \times \text{long. node}$, and OM is equal to $\frac{9'' \times \sin. \text{long. node}}{\sin. \text{obl. eclip.}}$. This equation is

additive to the mean longitude of the star when O is in the semicircle CBA, or while the ascending node is passing backwards from the vernal to the autumnal equinox but it is subtractive from it while O is in the semicircle ADC, or while the node is passing backwards from the autumnal to the vernal equinox; or, to express it more briefly, the equation is subtractive from the mean longitude of the star, while the ascending node is in the first six signs, and additive to it while the node is in the last six signs.

This equation of longitude is the same for all the stars, for their longitude is reckoned on the ecliptic (which is here supposed invariable); and therefore is affected only by the variation of the point from which the longitude is computed.

22
Right
ascension
suffers a
double
change,

The right ascension, being computed on the equator, suffers a double change. It is computed from, or begins at, a different point of the equator, and it terminates at a different point; because the equator having

changed its position, the circles of declination also change theirs. When the pole is at P, the right ascension of S from the solstitial colure is measured by the angle SPE, contained between that colure and the star's circle of declination. But when the pole is at O, the right ascension is measured by the angle SOE, and the difference of SPE and SOE is the equation of right ascension. The angle SOE consists of two parts, GOE and GOS; GOE remains the same wherever the star S is placed, but GOS varies with the place of the star.— We must first find the variation by which GPE becomes GOE, which variation is common to all the stars. The triangles GPE, GOE, have a constant side GE, and a constant angle G; the variation PO of the side GP is extremely small, and therefore the variation of the angles may be computed by Mr Cotes's Fluxionary Theorems. See Simpson's *Fluxions*, § 253, &c. As the tangent of the side EP, opposite to the constant angle G, is to the sine of the angle EPG, opposite to the constant side EG, so is PO the variation of the side GP, adjacent to the constant angle, to the variation α of the angle GPO, opposite to the constant side EG. This gives

$\alpha = \frac{9'' \times \sin. \text{long. node}}{\tan. \text{obl. eclip.}}$ This is subtractive from the mean right ascension for the first six signs of the node's longitude, and additive for the last six signs. This equation is common to all the stars.

The variation of the other part SOG of the angle, which depends on the different position of the hour circles PS and OS, which causes them to cut the equator in different points, where the arches of right ascension terminate, may be discovered as follows. The triangles SPG, SOG, have a constant side SG, and a constant angle G. Therefore, by the same Cotesian theorem, $\tan. SP : \sin. SPG = PO : y$, and y , or the second part of the nutation in right ascension, = $\frac{9'' \times \sin. \text{diff. R. A. of star and node}}{\cotan. \text{declin. star}}$

The nutation also affects the declination of the stars: For SP, the mean declination, is changed into SO.— Suppose a circle described round S, with the distance SO cutting SP in f ; then it is evident that the equation of declin. is $Pf = PO \times \cosine OPf = 9'' \times \sin. \text{r. ascen. of star} - \text{long. of node}$.

Such are the calculations in constant use in our astronomical researches, founded on Machin's Theory. When still greater accuracy is required, the elliptical theory must be substituted, by taking (as is expressed by the dotted lines) O in that point of the ellipse described on the transverse axis AC, where it is cut by OM, drawn according to Machin's theory. All the change made here is the diminution of OM in the ratio of 18 to 13,4, and a corresponding diminution of the angle CPO. The detail of it may be seen in De la Lande's *Astronomy*, art. 2874; but is rather foreign to our present purpose of explaining the precession of the equinoxes. The calculations being in every case tedious, and liable to mistakes, on account of the changes of the signs of the different equations, the zealous promoters of astronomy have calculated and published tables of all these equations, both on the circular and elliptical hypothesis. And still more to abridge calculations, which occur in reducing every astronomical observation, when the place of a phenomenon is deduced from a comparison

for

Precession. son with known fixed stars, there have been published tables of nutation and precession, for some hundreds of the principal stars, for every position of the moon's node and of the sun.

26 **Precession of the equinoctial points, &c.** It now remains to consider the precession of the equinoctial points, with its equations, arising from the nutation of the earth's axis as a physical phenomenon, and to endeavour to account for it upon those mechanical principles which have so happily explained all the other phenomena of the celestial motions.

27 **Observations of Newton and others on this subject.** This did not escape the penetrating eye of Sir Isaac Newton; and he quickly found it to be a consequence, and the most beautiful proof, of the universal gravitation of all matter to all matter; and there is no part of his immortal work where his sagacity and fertility of resource shine more conspicuously than in this investigation. It must be acknowledged, however, that Newton's investigation is only a shrewd guess, founded on assumptions, of which it would be extremely difficult to demonstrate either the truth or falsity, and which required the genius of a Newton to pick out in such a complication of abstruse circumstances. The subject has occupied the attention of the first mathematicians of Europe since his time; and is still considered as the most curious and difficult of all mechanical problems. The most elaborate and accurate dissertations on the precession of the equinoxes are those of Sylvabella and Walmeley, in the Philosophical Transactions, published about the year 1754; that of Thomas Simpson, published in his Miscellaneous Tracts; that of Father Frisius, in the Memoirs of the Berlin Academy, and afterwards, with great improvements, in his Cosmographia; that of Euler in the Memoirs of Berlin; that of D'Alembert in a separate dissertation; and that of De la Grange on the Libration of the Moon, which obtained the prize in the Academy of Paris in 1769. We think the dissertation of Father Frisius the most perspicuous of them all, being conducted in the method of geometrical analysis; whereas most of the others proceed in the fluxionary and symbolic method, which is frequently deficient in distinct notions of the quantities under consideration, and therefore does not give us the same perspicuous conviction of the truth of the results. In a work like ours, it is impossible to do justice to the problem, without entering into a detail which would be thought extremely disproportioned to the subject by the generality of our readers. Yet those who have the necessary preparation of mathematical knowledge, and wish to understand the subject fully, will find enough here to give them a very distinct notion of it; and in the article **ROTATION**, they will find the fundamental theorems, which will enable them to carry on the investigation. We shall first give a short sketch of Newton's investigation, which is of the most palpable and popular kind, and is highly valuable, not only for its ingenuity, but also because it will give our unlearned readers distinct and satisfactory conceptions of the chief circumstances of the whole phenomena.

28 **Sketch of Newton's investigation of it.** Plate CCCCXIV Let S (fig. 2.) be the Sun, E the Earth, and M the Moon, moving in the orbit NMCDn, which cuts the plane of the Ecliptic in the line of the nodes Nn, and has one half raised above it, as represented in the figure, the other half being hid below the Ecliptic. Suppose this orbit folded down; it will coincide with the Ecliptic in the circle N m c d n. Let EX represent the

Precession. axis of this orbit, perpendicular to its plane, and therefore inclined to the Ecliptic. Since the Moon gravitates to the Sun in the direction MS, which is all above the Ecliptic, it is plain that this gravitation has a tendency to draw the Moon towards the Ecliptic. Suppose this force to be such that it would draw the Moon down from M to i in the time that she would have moved from M to t, in the tangent to her orbit. By the combination of these motions, the Moon will desert her orbit, and describe the line Mr, which makes the diagonal of the parallelogram; and if no farther action of the sun be supposed, she will describe another orbit Mdn', lying between the orbit MCDn and the Ecliptic, and she will come to the Ecliptic, and pass through it in a point n'; nearer to M than n is, which was the former place of her descending node. By this change of orbit, the line EX will no longer be perpendicular to it; but there will be another line Ex, which will now be perpendicular to the new orbit. Also the Moon, moving from M to r, does not move as if she had come from the ascending node N, but from a point N' lying beyond it; and the line of the nodes of the orbit in this new position is N' n'. Also the angle MN'm is less than the angle MNm.

Thus the nodes shift their places in a direction opposite to that of her motion, or move to the westward; the axis of the orbit changes its position, and the orbit itself changes its inclination to the ecliptic. These momentary changes are different in different parts of the orbit, according to the position of the line of the nodes. Sometimes the inclination of the orbit is increased, and sometimes the nodes move to the eastward. But, in general, the inclination increases from the time that the nodes are in the line of syzygy, till they get into quadrature, after which it diminishes till the nodes are again in syzygy. The nodes advance only while they are in the octants after the quadratures, and while the moon passes from quadrature to the node, and they recede in all other situations. Therefore the recess exceeds the advance in every revolution of the moon round the earth, and, on the whole, they recede.

What has been said of one Moon, would be true of each of a continued ring of Moons surrounding the Earth, and they would thus compose a flexible ring, which would never be flat, but waved, according to the difference (both in kind and degree) of the disturbing forces acting on its different parts. But suppose these Moons to cohere, and to form a rigid and flat ring, nothing would remain in this ring but the excess of the contrary tendencies of its different parts. Its axis would be perpendicular to its plane, and its position in any moment will be the mean position of all the axes of the orbits of each part of the flexible ring; therefore the nodes of this rigid ring will continually recede, except when the plane of the ring passes through the Sun, that is, when the nodes are in syzygy; and (says Newton) the motion of these nodes will be the same with the mean motion of the nodes of the orbit of one Moon. The inclination of this ring to the ecliptic will be equal to the mean inclination of the Moon's orbit during any one revolution which has the same situation of the nodes. It will therefore be least of all when the nodes are in quadrature, and will increase till they are in syzygy, and then diminish till they are again in quadrature.

Suppose this ring to contract in dimensions, the disturbing

Precession. disturbing forces will diminish in the same proportion, and in this proportion will all their effects diminish. Suppose its motion of revolution to accelerate, or the time of a revolution to diminish; the linear effects of the disturbing forces being as the squares of the times of their action, and their angular effects as the times, those errors must diminish also on this account; and we can compute what those errors will be for any diameter of the ring, and for any period of its revolution. We can tell, therefore, what would be the motion of the nodes, the change of inclination, and deviation of the axis, of a ring which would touch the surface of the earth, and revolve in 24 hours; nay, we can tell what these motions would be, should this ring adhere to the earth. They must be much less than if the ring were detached; For the disturbing forces of the ring must drag along with it the whole globe of the earth. The quantity of motion which the disturbing forces would have produced in the ring alone, will now (says Newton) be produced in the whole mass; and therefore the velocity must be as much less as the quantity of matter is greater: But still all this can be computed.

Now there is such a ring on the earth: for the earth is not a sphere, but an elliptical spheroid. Sir Isaac Newton therefore engaged in a composition of the effects of the disturbing force, and has exhibited a most beautiful example of mathematical investigation. He first asserts, that the earth *must* be an elliptical spheroid, whose polar axis is to its equatorial diameter as 229 to 230. Then he demonstrates, that if the sine of the inclination of the equator be called π , and if t be the number of days (sidereal) in a year, the annual motion of

a detached ring will be $360^\circ \times \frac{3\sqrt{1-\pi^2}}{4t}$. He then shows that the effect of the disturbing force on this ring is to its effect on the matter of the same ring, distributed in the form of an elliptical stratum (but still detached) as 5 to 2; therefore the motion of the nodes will be $360^\circ \times \frac{3\sqrt{1-\pi^2}}{10t}$, or $16' 16'' 24'''$ annually. He

then proceeds to show, that the quantity of motion in the sphere is to that in an equatorial ring revolving in the same time, as the matter in the sphere to the matter in the ring, and as three times the square of a quadrant arch to two squares of a diameter, jointly: Then he shows, that the quantity of matter in the terrestrial sphere is to that in the protuberant matter of the spheroid, as 52900 to 461 (supposing all homogeneous). From these premises it follows, that the motion of $16' 16'' 24'''$, must be diminished in the ratio of 10717 to 100, which reduces it to $9'' 07'''$ annually. And this (he says) is the precession of the equinoxes, occasioned by the action of the sun; and the rest of the $50\frac{1}{2}''$, which is the observed precession, is owing to the action of the moon, nearly five times greater than that of the sun. This appeared a great difficulty; for the phenomena of the tides show that it *cannot* much exceed twice the sun's force.

Nothing can exceed the ingenuity of this process. Justly does his celebrated and candid commentator, Daniel Bernoulli, say (in his Dissertation on the Tides, which shared the prize of the French Academy with M'Laurin and Euler), that Newton saw through a veil

what others could hardly discover with a microscope **Precession.** in the light of the meridian sun. His determination of the form and dimensions of the earth, which is the foundation of the whole process, is not offered as any thing better than a probable guess, *in re difficillima*; and it has been since demonstrated with geometrical rigour by M'Laurin.

His next principle, that the motion of the nodes of the rigid ring is equal to the mean motion of the nodes of the moon, has been most critically discussed by the first mathematicians, as a thing which could neither be proved nor refuted. Frisius has at least shown it to be a mistake, and that the motion of the nodes of the ring is double the mean motion of the nodes of a single moon; and that Newton's own principles should have produced a precession of $18\frac{1}{2}$ seconds annually, which removes the difficulty formerly mentioned.

His third assumption, that the quantity of motion of the ring must be shared with the included sphere, was acquiesced in by all his commentators, till D'Alembert and Euler, in 1749, showed that it was not the quantity of motion round an axis of rotation which remained the same, but the quantity of momentum or rotatory effort. The quantity of motion is the product of every particle by its velocity; that is, by its distance from the axis; while its momentum, or power of producing rotation, is as the square of that distance, and is to be had by taking the sum of each particle multiplied by the square of its distance from the axis. Since the earth differs so little from a perfect sphere, this makes no sensible difference in the result. It will increase Newton's precession about three-fourths of a second.

We proceed now to the examination of this phenomenon upon the fundamental principles of mechanics. ³⁰ Examination of the phenomenon of precession on mechanical principles. Because the mutual gravitation of the particles of matter in the solar system is in the inverse ratio of the squares of the distance, it follows, that the gravitations of the different parts of the earth to the sun or to the moon are unequal. The nearer particles gravitate more than those that are more remote.

Let PQPE (fig. 3.), be a meridional section of the terrestrial sphere, and POpq the section of the inscribed sphere. Let CS be a line in the plane of the ecliptic passing through the sun, so that the angle ECS is the sun's declination. Let NCM be a plane passing thro' the centre of the earth at right angles to the plane of the meridian PQPE; NCM will therefore be the plane of illumination. Plate CCCCXIV

In consequence of the unequal gravitation of the matter of the earth to the sun, every particle, such as B, is acted on by a disturbing force parallel to CS, and proportional to BD, the distance of the particle from the plane of illumination; and this force is to the gravitation of the central particle to the sun, as three times BD is to CS, the distance of the earth from the sun.

Let ABa be a plane passing through the particle B, parallel to the plane EQ of the equator. This section of the earth will be a circle, of which Aa is a diameter, and Qq will be the diameter of its section with the inscribed sphere. These will be two concentric circles, and the ring by which the section of the spheroid exceeds the section of the sphere will have AQ for its breadth, Pp is the axis of figure.

The cosine of ECS

It is evident, that with respect to the inscribed sphere, the disturbing forces are completely compensated, for every particle has a corresponding particle in the adjoining quadrant, which is acted on by an equal and opposite force. But this is not the case with the protuberant matter which makes up the spheroid. The segments NS *sn* and MT *tm* are more acted on than the segments NT *tn* and MS *sm*; and thus there is produced a tendency to a conversion of the whole earth, round an axis passing through the centre C, perpendicular to the plane PQ *p* E. We shall distinguish this motion from all others to which the spheroid may be subject, by the name LIBRATION. The axis of this libration is always perpendicular to that diameter of the equator over which the sun is, or to that meridian in which he is.

PROB. I. To determine the momentum of libration corresponding to any position of the earth respecting the sun, that is, to determine the accumulated energy of the disturbing forces on all the protuberant matter of the spheroid.

Let B and *b* be two particles in the ring formed by the revolution of AQ, and so situated, that they are at equal distances from the plane NM; but on opposite sides of it. Draw BD, *bd*, perpendicular to NM, and FLG perpendicular to LT.

Then, because the momentum, or power of producing rotation, is as the force and as the distance of its line of direction from the axis of rotation, jointly, the combined momentum of the particles B and *b* will be $f \cdot BD \cdot DC - f \cdot bd \cdot dc$, (for the particles B and *b*, are urged in contrary directions). But the momentum of B is $f \cdot BF \cdot DC + f \cdot FD \cdot DC$, and that of *b* is $f \cdot bG \cdot dC - f \cdot dG \cdot dC$; and the combined momentum is $f \cdot BF \cdot DC - f \cdot FD \cdot DC + dC = 2f \cdot BF \cdot LF - 2f \cdot LT \cdot TC$.

Because *m* and *n* are the sine and cosine of the angle ECS or LCT, we have $LT = m \cdot CL$, and $CT = n \cdot CL$, and $LF = m \cdot BL$, and $BF = n \cdot BL$. This gives the momentum $= 2fmn \cdot BL^2 - CL^2$.

The breadth AQ of the protuberant ring being very small we may suppose, without any sensible error, that all the matter of the line AQ is collected in the point Q; and, in like manner, that the matter of the whole ring is collected in the circumference of its inner circle, and that B and *b* now represent, not single particles, but the collected matter of lines such as AQ, which terminate at B and *b*. The combined momentum of two such lines will therefore be $2mnf \cdot AQ \cdot BL^2 - CL^2$.

Let the circumference of each parallel of latitude be divided into a great number of indefinitely small and equal parts. The number of such parts in the circumference, of which Q \cdot g is the diameter, will be $\pi \cdot QL$. To each pair of these there belongs a momentum $2mnf \cdot AQ \cdot BL^2 - CL^2$. The sum of all the squares of BL,

which can be taken round the circle, is one half of as many squares of the radius CL: for BL is the sine of an arch, and the sum of its square and the square of its corresponding cosine is equal to the square of the radius. Therefore the sum of all the squares of the sines, together with the sum of all the squares of the cosines is equal to the sum of the same number of squares of the radius; and the sum of the squares of the sines is equal to the sum of the squares of the corresponding cosines: therefore the sum of the squares of the radius is double of either sum. Therefore $\int \pi \cdot QL \cdot BL^2 = \frac{1}{2} \pi \cdot QL \cdot CL^2$. In like manner the sum of the number $\pi \cdot QL$ of CL^2 s will be $= \pi \cdot QL \cdot CL^2$. These sums, taken for the semicircle, are $\frac{1}{4} \pi \cdot QL \cdot CL^2$, and $\frac{1}{2} \pi \cdot QL \cdot CL^2$, or $\pi \cdot QL \cdot \frac{1}{4} CL^2$, and $\pi \cdot QL \cdot \frac{1}{2} CL^2$: therefore the momentum of the whole ring will be $2mnf \cdot AQ \cdot QL \cdot \pi (\frac{1}{4} CL^2 - \frac{1}{2} CL^2)$: for the momentum of the ring is the combined momenta of a number of pairs, and this number is $\frac{1}{2} \pi \cdot QL$.

By the ellipse we have $OC : QL = EO : AQ$, and

$$AQ = QL \frac{EO}{OC}, = QL \frac{d}{b}; \text{ therefore the momentum of}$$

the ring is $2mnf \frac{d}{b} QL^2 \pi (\frac{1}{4} CL^2 - \frac{1}{2} CL^2), = mnf \frac{d}{b} QL^2 \pi (\frac{1}{2} CL^2 - CL^2)$: but $QL^2 = b^2 - x^2$; therefore

$$\frac{1}{2} QL^2 - CL^2 = \frac{1}{2} b^2 - \frac{1}{2} x^2 - x^2, = \frac{1}{2} b^2 - \frac{3}{2} x^2, = \frac{b^2 - 3x^2}{2};$$

therefore the momentum of the ring is $mnf \frac{d}{b} \pi (b^2 - x^2)$.

$$\left(\frac{b^2 - 3x^2}{2} \right) = mnf \frac{d}{b} \pi \left(\frac{b^4 - 4b^2 x^2 + 3x^4}{2} \right), = mnf \frac{d}{2b} \pi (b^4 - 4b^2 x^2 + 3x^4).$$

If we now suppose another parallel extremely near to Aa, as represented by the dotted line, the distance L \cdot l between them being x , we shall have the fluxion of the momentum of the spheroid

$$mnf \frac{d}{2b} \pi (b^4 x - 4b^2 x^3 + 3x^4 x), \text{ of which the fluent is}$$

$$mnf \frac{d}{2b} \pi \left(\frac{b^4 x^2}{2} - \frac{4b^2 x^4}{4} + \frac{3x^5}{5} \right).$$

This expresses the momentum of the zone EA aQ, contained between the equator and the parallel of latitude Aa. Now let x become $= b$, and we shall obtain the momentum of the

$$\text{hemispheroid} = mnf \frac{d}{2b} \pi (b^5 - \frac{4}{3} b^5 + \frac{3}{5} b^5), \text{ and that of}$$

$$\text{the spheroid} = mnf \frac{d}{b} \pi (b^5 - \frac{4}{3} b^5 + \frac{3}{5} b^5) = \frac{4}{15} mnf \frac{d}{b} \pi b^5.$$

This formula does not express any motion, but only a pressure tending to produce motion, and particularly tending to produce a libration by its action on the cohering matter of the earth, which is affected as a number of levers. It is similar to the common mechanical formula $w \cdot d$, where w means a weight, and d its distance from the fulcrum of the lever.

It is worthy of remark, that the momentum of this protuberant matter is just $\frac{4}{15}$ of what it would be if it were all collected at the point O of the equator: for the matter in the spheroid is to that in the inscribed sphere as a^2 to b^2 , and the contents of the inscribed sphere is $\frac{4}{15} \pi b^3$. Therefore $a^2 : a^2 - b^2 = \frac{4}{15} \pi b^3 : \frac{4}{15} \pi b^3 \frac{a^2 - b^2}{a^2}$, which is the quantity of protuberant matter.

We may, without sensible error, suppose $\frac{a^2 - b^2}{a} = 2d$,

Precession, $= 2d$; then the protuberant matter will be $\frac{4}{3}\pi n b^2 d$. If all this were placed at O, the momentum would be $\frac{4}{3}\pi d b^2 f \cdot OH \cdot HC$, $= \frac{4}{3}\pi n f d b^4$, because $OH \cdot HC = m n b^2$; now $\frac{4}{3}$ is 5 times $\frac{1}{3}$.

Also, because the sum of all the rectangles $OH \cdot HC$ round the equator is half of as many squares of OC , it follows that the momentum of the protuberant matter placed in a ring round the equator of the sphere or spheroid is one half of what it would be if collected in the point O or E; whence it follows that the momentum of the protuberant matter in its natural place is two fifths of what it would be if it were disposed in an equatorial ring. It was in this manner that Sir Isaac Newton was enabled to compare the effect of the sun's action on the protuberant matter of the earth, with his effect on a rigid ring of moons. The preceding investigation of the momentum is nearly the same with his, and appears to us greatly preferable in point of perspicuity to the fluxionary solutions given by later authors. These indeed have the appearance of greater accuracy, because they do not suppose all the protuberant matter to be condensed on the surface of the inscribed sphere: nor were we under the necessity of doing this, only it would have led to very complicated expressions had we supposed the matter in each line AQ collected in its centre of oscillation or gyration. We made a compensation for the error introduced by this, which may amount to $\frac{1}{15}$ of the whole, and should not be neglect-

ed, by taking d as equal to $\frac{a^2 - b^2}{2a}$, instead of $\frac{a^2 - b^2}{a \times b}$.

The consequence is, that our formula is the same with that of the later authors.

Thus far Sir Isaac Newton proceeded with mathematical rigour; but in the application he made two assumptions, or, as he calls them, hypotheses, which have been found to be unwarranted. The first was, that when the ring of protuberant matter is connected with the inscribed sphere, and subjected to the action of the disturbing force, the same quantity of motion is produced in the whole mass as in the ring alone. The second was, that the motion of the nodes of a rigid ring of moons is the same with the mean motion of the nodes of a solitary moon. But we are now able to demonstrate, that it is not the quantity of motion, but of momentum, which remains the same, and that the nodes of a rigid ring move twice as fast as those of a single particle. We proceed therefore to

Prob. 2. To determine the deviation of the axis, and the retrograde motion of the nodes which result from this libratory momentum of the earth's protuberant matter.

But here we must refer our readers to some fundamental propositions of rotatory motions which are demonstrated in the article *ROTATION*.

If a rigid body is turning round an axis A , passing through its centre of gravity with the angular velocity a , and receives an impulse which alone would cause it to turn round an axis B , also passing through its centre of gravity, with the angular velocity b , the body will now turn round a third axis C , passing through its centre of gravity, and lying in the plane of the axes A and B , and the sine of the inclination of this third axis to the axis A will be to the sine of inclination to the axis B as the velocity b to the velocity a .

When a rigid body is made to turn round any axis by the action of an external force, the quantity of

momentum produced that is, the sum of the products of every particle by its velocity and by its distance from the axis) is equal to the momentum or similar product of the moving force or forces.

If an oblate spheroid, whose equatorial diameter is a and polar diameter b , be made to librate round an equatorial diameter, and the velocity of that point of the equator which is farthest from the axis of libration be v , the momentum of the spheroid is $\frac{4}{15}\pi a^2 b^2 v$.

The two last are to be found in every elementary book of mechanics.

Let AN (fig. 4.) be the plane of the earth's equator, cutting the ecliptic CNK in the line of the nodes or equinoctial points Nn . Let OAS be the section of the earth by a meridian passing through the sun, so that the line OCS is in the ecliptic, and CA is an arch of an hour-circle or meridian, measuring the sun's declination. The sun not being in the plane of the equator, there is, by prop. 1. a force tending to produce a libration round an axis ZOz at right angles to the diameter Aa of that meridian in which the sun is situated, and the momentum of all the disturbing forces is $\frac{4}{15}\pi m n f d b^4$. The product of any force by the moment i of its action expresses the momentary increment of velocity; therefore the momentary velocity, or the velocity of libration generated in the time t is $\frac{4}{15}\pi m n f d b^4 t$. This is the absolute velocity of a point at the distance i from the axis, or it is the space which would be uniformly described in the moment t , with the velocity which the point has acquired at the end of that moment. It is double the space actually described by the libration during that moment; because this has been an uniformly accelerated motion, in consequence of the continued and uniform action of the momentum during this time. This must be carefully attended to, and the neglect of it has occasioned very faulty solutions of this problem.

Let v be the velocity produced in the point A , the most remote from the axis of libration. The momentum excited or produced in the spheroid is $\frac{4}{15}\pi a^2 b^2 v$ (as above), and this must be equal to the momentum of the moving force, or to $\frac{4}{15}\pi m n f d b^4 t$; therefore we obtain $v = \frac{\frac{4}{15}\pi m n f d b^4 t}{\frac{4}{15}\pi a^2 b^2}$, that is, $v = m n f d t \frac{b^2}{a^2}$, or very nearly $m n f d t$, because $\frac{b^2}{a^2} = 1$ very nearly. Also, because the product of the velocity and time gives the space uniformly described in that time, the space described by A in its libration round Zz is $m n f d t^2$, and the angular velocity is $\frac{m n f d t}{a}$.

Let r be the momentary angle of diurnal rotation. The arch Ar , described by the point A of the equator in this moment t will therefore be ar , that is, $a \times r$, and the velocity of the point A is $\frac{ar}{t}$ and the angular velocity of rotation is $\frac{r}{t}$.

Here then is a body (fig. 5.) turning round an axis OP , perpendicular to the plane of the equator xyz , and therefore situated in the plane ZPz ; and it turns round this

31
Effects of
the libra-
tory mo-
mentum of

rant mat-
ter,

Precession.

this axis with the angular velocity $\frac{r}{t}$. It has received an impulse, by which alone it would librate round the axis Zz , with the angular velocity $\frac{mnfd\dot{t}}{a}$. It will therefore turn round neither axis ($n^{\circ} 31.$), but round a third axis OP' , passing through O , and lying in the plane ZPz , in which the other two are situated, and the sine $P'n$ of its inclination to the axis of libration Zz will be to the sine $P'p$ of its inclination to the axis OP of rotation as $\frac{r}{t}$ to $\frac{mnfd\dot{t}}{a}$.

Now A , in fig. 4. is the summit of the equator both of libration and rotation; $mnfd\dot{t}^2$ is the space described by its libration in the time \dot{t} ; and $a\dot{r}$ is the space or arch Ar (fig. 4.) described in the same time by its rotation: therefore, taking Ar to Ac (perpendicular to the plane of the equator of rotation, and lying in the equator of libration), as $a\dot{r}$ to $mnfd\dot{t}^2$, and completing the parallelogram $Armc$, Am will be the compound motion of A ($n^{\circ} 31.$), and $a\dot{r} : mnfd\dot{t}^2 = 1 : \frac{mnfd\dot{t}^2}{a\dot{r}}$, which will be the tangent of the angle

mAr , or of the change of position of the equator. But the axes of rotation are perpendicular to their equator; and therefore the angle of deviation \dot{w} is equal to this angle rAm . This appears from fig. 5.; for $\Pi P : P'p = Op : P'p = OP : \tan. POP$; and it is

evident that $a\dot{r} : mnfd\dot{t}^2 = \frac{r}{t} : mnfd\frac{\dot{t}}{a}$, as is required by the composition of rotations.

In consequence of this change of position, the plane of the equator no longer cuts the plane of the ecliptic in the line Nn . The plane of the new equator cuts the former equator in the line AO , and the part AN of the former equator lies between the ecliptic and the new equator AN' , while the part $A'n$ of the former equator is above the new one $A'n'$; therefore the new node N' , from which the point A was moving, is removed to the westward, or farther from A ; and the new node n' , to which A is approaching, is also moved westward, or nearer to A ; and this happens in every position of A . The nodes, therefore, or equinoctial points, continually shift to the westward, or in a contrary direction to the rotation of the earth; and the axis of rotation always deviates to the east side of the meridian which passes through the sun.

This account of the motions is extremely different from what a person should naturally expect. If the earth were placed in the summer solstice, with respect to us who inhabit its northern hemisphere, and had no rotation round its axis, the equator would begin to approach the ecliptic, and the axis would become more upright; and this would go on with a motion continually accelerating, till the equator coincided with the ecliptic. It would not stop here, but go as far on the other side, till its motion were extinguished by the opposing forces; and it would return to its former position, and again begin to approach the ecliptic, playing up and down like the arm of a balance. On this account this motion is very properly termed *libration*; but this very slow libration, compounded with the incomparably swifter motion of diurnal rotation, produces a third mo-

Precession.

tion extremely different from both. At first the north pole of the earth inclines forward toward the sun; after a long course of years it will incline to the left hand, as viewed from the sun, and be much more inclined to the ecliptic, and the plane of the equator will pass through the sun. Then the south pole will come into view, and the north pole will begin to decline from the sun; and this will go on (the inclination of the equator diminishing all the while) till, after a course of years, the north pole will be turned quite away from the sun, and the inclination of the equator will be restored to its original quantity. After this the phenomena will have another period similar to the former, but the axis will now deviate to the right hand. And thus, although both the earth and sun should not move from their places, the inhabitants of the earth would have a complete succession of the seasons accomplished in a period of many centuries. This would be prettily illustrated by an iron ring poised very nicely on a cap like the card of a mariner's compass, having its centre of gravity coinciding with the point of the cap, so that it may whirl round in any position. As this is extremely difficult to execute, the cap may be pierced a little deeper, which will cause the ring to maintain a horizontal position with a very small force. When the ring is whirling very steadily, and pretty briskly, in the direction of the hours of a watch-dial, hold a strong magnet above the middle of the nearer semicircle (above the 6 hour point) at the distance of three or four inches. We shall immediately observe the ring rise from the 9 hour point, and sink at the 3 hour point, and gradually acquire a motion of precession and nutation, such as has been described.

If the earth be now put in motion round the sun, or the sun round the earth, motions of libration and deviation will still obtain, and the succession of their different phases, if we may so call them, will be perfectly analogous to the above statement. But the quantity of deviation, and change of inclination, will now be prodigiously diminished, because the rapid change of the sun's position quickly diminishes the disturbing forces, annihilates them by bringing the sun into the plane of the equator, and brings opposite forces into action.

We see in general that the deviation of the axis is always at right angles to the plane passing through the sun, and that the axis, instead of being raised from the ecliptic, or brought nearer to it, as the libration would occasion, deviates sidewise; and the equator, instead of being raised or depressed round its east and west points, is twisted sidewise round the north and south points; or at least things have this appearance: but we must now attend to this circumstance more minutely.

The composition of rotation, shows us that this change of the axis of diurnal rotation is by no means a translation of the former axis (which we may suppose to be the axis of figure) into a new position, in which it again becomes the axis of diurnal motion; nor does the equator of figure, that is, the most prominent section of the terrestrial spheroid, change its position, and in this new position continue to be the equator of rotation. This was indeed supposed by Sir Isaac Newton; and this supposition naturally resulted from the train of reasoning which he adopted. It was strictly true of a single moon, or of the imaginary orbit attached to it; and therefore Newton supposed that the whole earth did in this manner deviate from its former position, still, however, turning round its axis of figure. In this he has been followed by Walmesley, Simpson, and most

Precession. most of his commentators. D'Alembert was the first who entertained any suspicion that this might not be certain; and both he and Euler at last showed that the new axis of rotation was really a new line in the body of the earth, and that its axis and equator of figure did not remain the axis and equator of rotation. They ascertained the position of the real axis by means of a most intricate analysis, which obscured the connection of the different positions of the axis with each other, and gave us only a kind of momentary information. Father Frisius turned his thoughts to this problem, and fortunately discovered the composition of rotations as a general principle of mechanical philosophy. Few things of this kind have escaped the penetrating eye of Sir Isaac Newton. Even *this* principle had been glanced at by him. He affirms it in express terms with respect to a body that is perfectly spherical (cor. 22. prop. 66. B. I.) But it was reserved for Frisius to demonstrate it to be true of bodies of any figure, and thus to enrich mechanical science with a principle which gives simple and elegant solutions of the most difficult problems.

But here a very formidable objection naturally offers itself. If the axis of the diurnal motion of the heavens is not the axis of the earth's spheroidal figure, but an imaginary line in it, round which even the axis of figure must revolve; and if this axis of diurnal rotation has so greatly changed its position, that it now points at a star at least 12 degrees distant from the pole observed by Timochares, how comes it that the equator has the very same situation on the surface of the earth that it had in ancient times? No sensible change has been observed in the latitudes of places.

The answer is very simple and satisfactory: Suppose that in 12 hours the axis of rotation has changed from the position PR (fig. 6.) to pr , so that the north pole, instead of being at P, which we may suppose to be a particular mountain, is now at p . In this 12 hours the mountain P, by its rotation round pr , has acquired the position π . At the end of the next 12 hours, the axis of rotation has got the position πp , and the axis of figure has got the position pr , and the mountain P is now at p . Thus, on the noon of the following day, the axis of figure PR is in the situation which the real axis of rotation occupied at the intervening midnight. This goes on continually, and the axis of figure follows the position of the axis of rotation, and is never further removed from it than the deviation of 12 hours, which does not exceed $\frac{1}{750}$ th part of one second, a quantity altogether imperceptible. Therefore the axis of figure will always sensibly coincide with the axis of rotation, and no change can be procured in the latitudes of places on the surface of the earth.

34
Applica-
tion of this
reasoning
to nuta-
tion and
precession.

We have hitherto considered this problem in the most general manner; let us now apply the knowledge we have gotten of the deviation of the axis or of the momentary action of the disturbing force to the explanation of the phenomena: that is, let us see what precession and what nutation will be accumulated after any given time of action.

For this purpose we must ascertain the precise deviation which the disturbing forces are competent to produce. This we can do by comparing the momentum of libration with the gravitation of the earth to the sun, and this with the force which would retain a body on the equator while the earth turns round its axis.

Precession. The gravitation of the earth to the sun is in the proportion of the sun's quantity of matter M directly, and to the square of the distance A inversely, and may therefore be expressed by the symbol $\frac{M}{A^2}$. The disturbing force

at the distance 1 from the plane of illumination is to the gravitation of the earth's centre to the sun as 3 to A, (A being measured on the same scale which measures the distance from the plane of illumination). Therefore $\frac{3M}{A^3}$ will be the disturbing force f of our formula.

Let p be the centrifugal force of a particle at the distance 1 from the axis of rotation; and let t and T be the times of rotation and of annual revolution, viz. sidereal day and year. Then $p : \frac{M}{A^2} = \frac{1}{t^2} : \frac{A}{T^2}$. Hence we derive $\frac{3M}{A^3} = 3p \frac{t^2}{T^2}$. But since r was the angular velocity of rotation, and consequently $1 \times r$ the space described, and $\frac{1 \times r}{t}$ the velocity; and since the

centrifugal force is as the square of the velocity divided by the radius, (this being the measure of the generated velocity, which is the proper measure of any accelerating force), we have $p = \frac{1^2 \times r^2}{1^2 \times t^2} = \frac{r^2}{t^2}$, and $f = \frac{3r^2}{t^2}$.

$\times \frac{t^2}{T^2}$. Now the formula $f m n d \frac{i^2}{a}$ expressed the sine of the angle. This being extremely small, the sine may be considered as equal to the arc which measures the angle. Now, substitute for it the value now found, viz.

$\frac{3r^2}{t^2} \times \frac{t^2}{T^2}$, and we obtain the angle of deviation $\dot{\omega} = r \frac{3t^2}{T^2} m n \frac{d}{a}$, and this is the simplest form in which it

can appear. But it is convenient, for other reasons, to express it a little differently: d is nearly equal to $\frac{a^2 - b^2}{2a^2}$, therefore $\dot{\omega} = r \times \frac{3}{2} \frac{t^2}{T^2} m n \frac{a^2 - b^2}{a^2}$, and this is the form in which we shall now employ it.

The small angle $r \frac{3t^2}{2T^2} m n \frac{a^2 - b^2}{a^2}$ is the angle in which the new equator cuts the former one. It is different at different times, as appears from the variable part mn , the product of the sine and cosine of the sun's declination. It will be a maximum when the declination is in the solstice, for mn increases all the way to 45° , and the declination never exceeds $23\frac{1}{2}^\circ$. It increases, therefore, from the equinox to the solstice, and then diminishes.

Let ESL (fig. 7.) be the ecliptic, EAC the equator, BAD the new position which it acquires by the momentary action of the sun, cutting the former in the angle BAE $= r \frac{3}{2} \frac{t^2}{T^2} m n \frac{a^2 - b^2}{a^2}$. Let S be the sun's place in the ecliptic, and AS the sun's declination, the meridian AS being perpendicular to the equator. Let $\frac{a^2 - b^2}{a^2}$ be k . The angle BAE is then $= r \frac{3t^2}{2T^2} k m n$. In

the

Precession. the spherical triangle BAE we have $\sin. B : \sin. AE = \sin. A : \sin. BE$, or $= A : BE$, because very small angles and arches are as their sines. Therefore BE, which is the momentary precession of the equinoctial point E, is equal to $A \frac{\sin. AE}{\sin. B} = r \times \frac{3t^2}{2T^2} k m n$, $\sin. R. ascens.$
 $\sin. obl. ecl.$

35
Various
modes of
applica-
tion.

The equator EAC, by taking the position BAD, recedes from the ecliptic in the colure of the solstices CL, and CD is the change of obliquity or the nutation. For let CL be the solstitial colure of BAD, and $c l$ the solstitial colure of EAC. Then we have $\sin. B : \sin. E = \sin. LD : \sin. lc$; and therefore the difference of the arches LD and lc will be the measure of the difference of the angles B and E. But when BE is indefinitely small, CD may be taken for the difference of LD and lc , they being ultimately in the ratio of equality. Therefore CD measures the change of the obliquity of the ecliptic, or the nutation of the axis with respect to the ecliptic.

The real deviation of the axis is the same with the change in the position of the equator, Pp being the measure of the angle EAB. But this not being always made in a plane perpendicular to the ecliptic, the change of obliquity generally differs from the change in the position of the axis. Thus when the sun is in the solstice, the momentary change of the position of the equator is the greatest possible; but being made at right angles to the plane in which the obliquity of the ecliptic is computed, it makes no change whatever in the obliquity, but the greatest possible change in the precession.

36 In order to find CD the change of obliquity, observe that in the triangle CAD, $R : \sin. AC$, or $R : \cos. AE = \sin. A : \sin. CD$, $= A : CD$ (because A and CD are exceedingly small). Therefore the change of obliquity (which is the thing commonly meant by nutation) $CD = A \times \cos. AE = \frac{3t^2}{2T^2} kmn \cos. AE = \frac{3t^2}{2T^2} k \times \sin. declin. \times \cos. declin. \times \cos. R. ascens.$

37 But it is more convenient for the purposes of astronomical computation to make use of the sun's longitude SE. Therefore make

The sun's longitude ES	-	-	=	z
Sine of sun's long.	-	-	=	x
Cofine	-	-	$\sqrt{1-x^2}$	y
Sine obliq. eclipt.	-	-	$23\frac{1}{2}$	p
Cofine obliq.	-	-	-	q

38 In the spherical triangle EAS, right angled at A (because AS is the sun's declination perpendicular to the equator), we have $R : \sin. ES = \sin. E : \sin. AS$, and $\sin. AS = p x$. Also $R : \cos. AS = \cos. AE : \cos. ES$, and $\cos. ES$ or $y = \cos. AS \times \cos. AE$. Therefore $p x y = \sin. AS \times \cos. AS \times \cos. AE = mn \times \cos. AE$. Therefore the momentary nutation $CD = r \times \frac{3t^2}{2T^2} k p x y$.

39 We must recollect that this angle is a certain fraction of the momentary diurnal rotation. It is more convenient to consider it as a fraction of the sun's annual motion, that so we may directly compare his motion on the ecliptic with the precession and nutation corresponding to his situation in the heavens. This change is easily made, by augmenting the fraction in the ratio of the sun's angular motion to the motion of

VOL. XV.

rotation, or multiplying the fraction by $\frac{T}{t}$; therefore **Precession.**

the momentary nutation will be $r \times \frac{3t^2}{2T^2} k p x y$. In this value $\frac{3tkp}{2T}$ is a constant quantity, and the momentary nu-

tation is proportional to $x y$, or to the product of the sine and cosine of the sun's longitude, or to the sine of twice the sun's longitude; for $x y$ is equal to half the sine of twice z .

If therefore we multiply this fraction by the sun's momentary angular motion, which we may suppose, with abundant accuracy, proportional to z , we obtain the fluxion of the nutation, the fluent of which will express the whole nutation while the sun describes the arch z of the ecliptic, beginning at the vernal equinox. Therefore, in place of y put $\sqrt{1-x^2}$, and in place of z put $\frac{x}{\sqrt{1-x^2}}$, and we have the fluxion of the nu-

tation for the moment when the sun's longitude is z and the fluent will be the whole nutation. The fluxion resulting from this process is $\frac{3tkp}{2T} x \dot{x}$, of which the

fluent is $\frac{3tkp}{4T} x^2$. This is the whole change produced on the obliquity of the ecliptic while the sun moves along the arch z ecliptic, reckoned from the vernal equinox. When this arch is 90° , x^2 is 1, and therefore $\frac{3tkp}{4T}$ is the nutation produced while the sun moves from the equinox to the solstice.

The momentary change of the axis and plane of the equator (which is the measure of the changing force) is $\frac{3tk}{2T} mn$.

The momentary change of the obliquity of the ecliptic is $\frac{3tkp}{2T} x \dot{x}$ 41
The real and momentary changes greatest at the solstices and at the equinoxes, nothing.

The whole change of obliquity is $\frac{3tkp}{4T} x^2$.

Hence we see that the force and the real momentary change of position are greatest at the solstices, and diminish to nothing in the equinoxes.

The momentary change of obliquity is greatest at the octants, being proportional to $x \dot{x}$ or to $x y$.

The whole accumulated change of obliquity is greatest at the solstices, the obliquity itself being then smallest.

We must in like manner find the accumulated quantity of the precession after a given time, that is, the arch BE for a finite time. 42
Quantity of precession in a given time.

We have $ER : CD = \sin. EA : \sin. CA$ (or $\cos. EA$) $= \tan. EA : 1$, and $EB : ER = 1 : \sin. B$. Therefore $EB : CD = \tan. EA : \sin. B$. But $\tan. EA = \cos. E \times \tan. ES = \cos. E \times \frac{\sin. long.}{\cos. long.} = \frac{q x}{\sqrt{1-x^2}}$.

Therefore $EB : CD = \frac{q x}{\sqrt{1-x^2}} p$, and $CD = EB : \frac{\sin. obliq. eclipt.}{\tan. long.}$ ☉

If we now substitute for CD its value found in no 40. viz. $\frac{3tkp}{2T} x \dot{x}$, we obtain $EB = \frac{3t}{2T} \times \frac{k q x^2 \dot{x}}{\sqrt{1-x^2}}$, the fluxion of the precession of the

3 N

equis

Precession, equinoxes occasioned by the action of the sun. The fluent of the variable part $\frac{x^2 x}{\sqrt{1-x^2}} = xy$, of which the fluent is evidently a segment of a circle whose arch is z and sine x , that is, $= \frac{z-x\sqrt{1-x^2}}{2}$ and the whole precession, while the sun describes the arch z , is $\frac{3t}{2T} \times \frac{kq}{2} (2-x\sqrt{1-x^2})$. This is the precession of the equinoxes while the sun moves from the vernal equinox along the arch z of the ecliptic.

In this expression, which consists of two parts, $\frac{3tkq}{4T}$ z , and $\frac{3tkq}{4T} (-x\sqrt{1-x^2})$, the first is incomparably greater than the second, which never exceeds $1''$, and is always compensated in the succeeding quadrant. The precession occasioned by the sun will be $\frac{3tkq}{4T} z$, and from this expression we see that the precession increases uniformly, or at least increases at the same rate with the sun's longitude z , because the quantity $\frac{3tkq}{4T}$ is constant.

43
Mode of
using the
formulæ.

In order to make use of these formulæ, which are now reduced to very great simplicity, it is necessary to determine the values of the two constant quantities $\frac{3tkp}{4T}$, $\frac{3tkq}{4T}$, which we shall call N and P , as factors of the nutation and precession. Now t is one sidereal day, and T is $366\frac{1}{4}$. k is $\frac{a^2-b^2}{a^2}$, which according to Sir Isaac Newton is $\frac{231^2-230^2}{231^2} = \frac{1}{115}$; p and q are the sine and cosine of $23^\circ 28'$, viz. 0.39822 and 0.91729.

These data give $N = \frac{1}{141030}$ and $P = \frac{1}{61224}$ of which the logarithms are 4.85069 and 5.21308, viz. the arithmetical complements of 5.14931 and 4.78692.

44
Example of
the utility
of the in-
vestigation.

Let us, for an example of the use of this investigation, compute the precession of the equinoxes when the sun has moved from the vernal equinox to the summer solstice, so that z is 90° , or $324000''$.

Log 324000'' = z	-	-	5.51055
Log P	-	-	5.21308
Log $5''$, 292	-	-	0.72363

The precession therefore in a quarter of a year is 5,292 seconds; and, since it increases uniformly, it is $21''$, 168 annually.

45
Assump-
tions on
which the
computa-
tion pro-
ceeds.

We must now recollect the assumptions on which this computation proceeds. The earth is supposed to be homogeneous, and the ratio of its equatorial diameter to its polar axis is supposed to be that of 231 to 230. If the earth be more or less protuberant at the equator, the precession will be greater or less in the ratio of this protuberance. The measures which have been taken of the degrees of the meridian are very inconsistent among themselves; and although a comparison of them all indicates a smaller protuberancy, nearly $\frac{1}{115}$ instead of $\frac{1}{115}$, their differences are too great to leave much confidence in this method. But if this

figure be thought more probable, the precession will be reduced to about $17''$ annually. But even though the figure of the earth were accurately determined, we have no authority to say that it is homogeneous. If it be denser towards the centre, the momentum of the protuberant matter will not be so great as if it were equally dense with the inferior parts, and the precession will be diminished on this account. Did we know the proportion of the matter in the moon to that in the sun, we could easily determine the proportion of the whole observed annual precession of $50\frac{1}{4}''$ which is produced by the sun's action. But we have no unexceptionable data for determining this; and we are rather obliged to infer it from the effect which the produces in disturbing the regularity of the precession, as will be considered immediately. So far, therefore, as we have yet proceeded in this investigation, the result is very uncertain. We have only ascertained unquestionably the law which is observed in the solar precession. It is probable, however, that this precession is not very different from $20''$ annually; for the phenomena of the tides show the disturbing force of the sun to be very nearly $\frac{1}{4}$ of the disturbing force of the moon. Now $20''$ is $\frac{1}{2}$ of $50''$.

But let us now proceed to consider the effect of the moon's action on the protuberant matter of the earth; and as we are ignorant of her quantity of matter, and consequently of her influence in similar circumstances with the sun, we shall suppose that the disturbing force of the moon is to that of the sun as m to 1 . Then (*ceteris paribus*) the precession will be to the solar precession π in the ratio of the force and of the time of its action jointly. Let t and T therefore represent a periodical month and year, and the lunar precession will be $= \frac{m \pi t}{T}$. This precession must be reckoned on the

46
Effect of
the moon's
action on
the protu-
berant
matter of
the earth,

plane of the lunar orbit, in the same manner as the solar precession is reckoned on the ecliptic. We must also observe, that $\frac{m \pi t}{T}$ represents the lunar precession

only on the supposition that the earth's equator is inclined to the lunar orbit in an angle of $23\frac{1}{2}^\circ$ degrees. This is indeed the mean inclination; but is sometimes increased to above 28° , and sometimes reduced to 18° . Now in the value of the solar precession the cosine of the obliquity was employed. Therefore whatever is the angle E contained between the equator and the lu-

nar orbit, the precession will be $= \frac{m \pi t}{T} \cdot \frac{\text{Cos. } E}{\text{Cos. } 23\frac{1}{2}^\circ}$, and it must be reckoned on the lunar orbit.

Now let γB (fig. 8.) be the immoveable plane of the ecliptic, $\gamma ED \triangleq F$ the equator in its first situation, before it has been deranged by the action of the moon, $AGRDBH$ the equator in its new position, after the momentary action of the moon. Let $EGNFH$ be the moon's orbit, of which N is the ascending node, and the angle $N = 5^\circ 8' 46''$.

Let $N\gamma$ the long. of the node be z
 Sine $N\gamma$ $-$ $-$ $-$ $-$ x
 Cosine $N\gamma$ $-$ $-$ $-$ $-$ y
 Sine $\gamma = 23\frac{1}{2}$ $-$ $-$ $-$ $-$ a

Revolution of $\oplus = 366\frac{1}{4}$
Revolution of $N = 18$ years 7 months

while the node continually changes its place, and in the space of 18 years makes a complete tour of the heavens.

We must, therefore, take the motion of the node as the fluent of comparison, or we must compare the fluxions of the node's motion with the fluxions of the precession and nutation; therefore, let the longitude of the node be z , and its monthly change $= z$; we shall then have

48
Lunar precession in a month reduced to the ecliptic.

In order to reduce the lunar precession to the ecliptic, we must recollect that the equator will have the same inclination at the end of every half revolution of the sun or of the moon, that is, when they pass through the equator, because the sum of all the momentary changes of its position begins again each revolution. Therefore if we neglect the motion of the node during one month, which is only $1\frac{1}{2}$ degrees, and can produce but an insensible change, it is plain that the moon produces, in one half revolution, that is, while she moves from H to G, the greatest difference that she can in the position of the equator. The point D, therefore, half-way from G to H, is that in which the moveable equator cuts the primitive equator, and DE and DF are each 90° . But S being the solstitial point, γS is also 90° . Therefore $DS = \gamma E$. Therefore, in the triangle DGE, we have $\sin. ED : \sin. G = \sin. EG : \sin. D$, $= EG : D$. Therefore $D = EG \times \sin. G = EG \times \sin. E$ nearly. Again, in the triangle γDA we have $\sin. A : \sin. \gamma D$ (or $\cos. \gamma E$) $= \sin. D : \sin. \gamma A$, $= D : \gamma A$. Therefore $\gamma A = \frac{D \cdot \text{Cof. } \gamma E}{\sin. A} = \frac{EG \cdot \sin. E \cdot \text{Cof. } \gamma E}{\sin. 23\frac{1}{4}}$, $= \frac{m \pi t \sin. E \cdot \text{Cof. } E \cdot \text{Cof. } \gamma E}{T \sin. \gamma \cdot \text{Cof. } \gamma}$.

49 This is the lunar precession produced in the course of one month, estimated on the ecliptic, not constant like the solar precession, but varying with the inclination or the angle E or F, which varies both by a change in the angle N, and also by a change in the position of N on the ecliptic.

50
Nutation in the same time,

We must find in like manner the nutation SR produced in the same time, reckoned on the colure of the solstices RL. We have $R : \sin. DS = D : RS$, and $RS = D \cdot \sin. DS = D \cdot \sin. a h E$. But $D = EG \cdot \sin. E$.

Therefore $RS = EG \cdot \sin. E \cdot \sin. \gamma E$, $= \frac{m \pi t \text{ Cof. } E}{T \cdot \text{Cof. } \gamma} \times \sin. E \times \sin. \gamma E$. In this expression we must substitute the angle N, which may be considered as constant during the month, and the longitude γN , which is also nearly constant, by observing that $\sin. E : \sin. \gamma N = \sin. N : \sin. \gamma E$. Therefore $RS = \frac{m \pi t}{T} \times \frac{\sin. N \cdot \sin. \gamma N \cdot \text{Cof. } E}{\text{Cof. } \gamma}$.

But we must exterminate the angle E, because it changes by the change of the position of N. Now, in the triangle EN γ we have $\cos. E = \cos. \gamma N \cdot \sin. N \cdot \sin. \gamma$ — $\cos. N \cdot \cos. \gamma$, $= yca - db$. And because the angle E is necessarily obtuse, the perpendicular will fall without the triangle, the cosine of E will be negative, and we shall have $\cos. E = bd - acy$. Therefore the nutation for one month will be $= \frac{m \pi t}{T} \times \frac{\cos. (bd - acy)}{b}$, the node being supposed all the while in N.

51
May be considered as momentary parts of the moon's action.

These two expressions of the monthly precession and nutation may be considered as momentary parts of the moon's action, corresponding to a certain position of the node and inclination of the equator, or as the fluxions of the whole variable precession and nutation,

$t : n :: z : e$, and $t = \frac{n z}{e}$, $= \frac{n z}{e \sqrt{1-x^2}}$. Let T be = 1,

in order that n may be 18,6, and substitute for t its value in the fluxion of the nutation, by putting $\sqrt{1-x^2}$

in place of y . By this substitution we obtain $m \pi n \frac{c}{e b}$

$\left(\frac{d b x}{\sqrt{1-x^2}} - a c x \right)$. The fluent of this is $m \pi n \frac{c}{e b}$

$\left(-d b \sqrt{1-x^2} - \frac{a c x^2}{2} \right)$. (Vide Simpson's Fluxions,

§ 77). But when x is = 0, the nutation must be = 0, because it is from the position in the equinoctial points that all our deviations are reckoned, and it is from this point that the periods of the lunar action recommences.

But if we make $x=0$ in this expression, the term $\frac{a c x^2}{2}$ vanishes, and the term $-d b \sqrt{1-x^2}$ becomes $= -d b$; therefore our fluent has a constant part $+d b$;

and the complete fluent is $m \pi n \frac{c}{e b} \left(d b - d b \sqrt{1-x^2} - \frac{a c x^2}{2} \right)$. Now this is equal to $m \pi n \frac{c}{e b} (d b \times \text{versed}$

fine, $z - \frac{1}{2} a c \times \text{versed fine } 2 z)$: For the versed fine of z is equal to $(1 - \cos. z)$; and the square of the fine of an arch is $\frac{1}{2}$ the versed fine of twice that arch.

This, then, is the whole nutation while the moon's ascending node moves from the vernal equinox to the longitude $\gamma N = z$. It is the expression of a certain number of seconds, because π , one of its factors, is the solar precession in seconds; and all the other factors are numbers, or fractions of the radius 1; even e is expressed in terms of the radius 1.

The fluxion of the precession, or the monthly precession, is to that of the nutation as the cotangent of γE is to the sine of γ . This also appears by considering figure 7. Pp measures the angle A, or change of position of the equator; but the precession itself, reckoned on the ecliptic, is measured by Po, and the nutation by pa; and the fluxion of the precession is equal to the fluxion of

nutations $\times \frac{\cot. \gamma E}{\sin. \gamma}$, but $\cot. \gamma E = \frac{a d + b c y}{c x}$;

therefore $\frac{\cot. \gamma E}{\sin. \gamma} = \frac{a d + b c \sqrt{1-x^2}}{c x}$: This, multiplied into

the fluxion of the nutation, gives $\frac{m \pi n}{a b e} \left(\frac{a b d^2}{\sqrt{1-x^2}} + (b^2 - a^2) d c - a b c^2 \cdot \sqrt{1-x^2} \right) x$ for the monthly precession. The fluent of this $\frac{m \pi n}{a b e} (a d^2 b z + (b^2 - a^2)$

$d c x - \frac{1}{2} a b c^2 z - \frac{1}{2} a b c^2 x \sqrt{1-x^2})$, or it is equal to $\frac{m \pi n}{a b e} \left((d^2 - \frac{1}{2} c^2) a b z + (b^2 - a^2) d c x - \frac{1}{2} a b c^2 \right.$

Precession.

55

Let us now express this in numbers: When the node has made a half revolution, we have $z = 180^\circ$, whose versed sine is 2, and the versed sine of $2z$, or 360° , is $= 0$; therefore, after half a revolution of the node, the nutation ($n^\circ 52$.) becomes, $\frac{m \pi n c}{e b} 2 b d$. If, in this expression, we suppose $m = 2\frac{1}{2}$, and $\pi = 14\frac{1}{2}''$, we shall find the nutation to be $19\frac{1}{2}''$.

56

Now the observed nutation is about $18''$. This requires m to be $2\frac{1}{5}$, and $\pi = 16\frac{1}{4}''$. But it is evident, that no astronomer can pretend to warrant the accuracy of his observations of the nutation within $1''$.

To find the lunar precession during half a revolution of the node, observe, that then z becomes $= \frac{e}{2}$, and the sine of z and of $2z$ vanish, d^2 becomes $1 - c^2$, and the precession becomes $\frac{m \pi n}{2} (d^2 - \frac{1}{2} c^2)$, $= \frac{m \pi n}{2} (1 - \frac{3}{2} c^2)$, and the precession in 18 years is $m \pi n \frac{1 - \frac{3}{2} c^2}{2}$.

57

We see, by comparing the nutation and precession for nine years, that they are as $\frac{4 c d}{e}$ to $1 - \frac{3}{2} c^2$ nearly as 1 to $17\frac{1}{2}$. This gives $313''$ of precession, corresponding to $18''$, the observed nutation, which is about $35''$ of precession annually produced by the moon.

58

Gives the disturbing force and matter of the moon.

And thus we see, that the inequality produced by the moon in the precession of the equinoxes, and, more particularly, the nutation occasioned by the variable obliquity of her orbit, enables us to judge of her share in the whole phenomenon; and therefore informs us of her disturbing force, and therefore of her quantity of matter. This phenomenon, and those of the tides, are the only facts which enable us to judge of this matter: and this is one of the circumstances which has caused this problem to occupy so much attention. Dr Bradley, by a nice comparison of his observations with the mathematical theory, as it is called, furnished him by Mr Machin, found that the equation of precession computed by that theory was too great, and that the theory would agree better with the observations, if an ellipse were substituted for Mr Machin's little circle. He thought that the shorter axis of this ellipse, lying in the colure of the solstices, should not exceed $16''$. Nothing can more clearly show the astonishing accuracy of Bradley's observations than this remark: for it results from the theory, that the pole must really describe an ellipse, having its shorter axis in the solstitial colure, and the ratio of the axes must be that of 18 to 16,8; for the mean precession during a half revolution of the node is $\frac{m \pi n}{2} (d^2 - \frac{c^2}{2})$; and therefore, for the longi-

tude z , it will be $\frac{m \pi n}{e} (d^2 - \frac{c^2}{2})$; when this is taken from the true precession for that longitude ($n^\circ 54$.), it leaves the equation of precession $\frac{m \pi n}{a b e} ((b^2 - a^2) d c \text{ sine } z - \frac{1}{4} a b c \text{ sine } 2z)$; therefore, when the node is in the solstice, and the equation greatest, we have it $= \frac{m \pi n c d}{a b e} (b^2 - a^2)$. We here neglect the second term as insignificant.

59

Greatest equation of precession.

This greatest equation of precession is to $\frac{2 m \pi n c d}{6}$

the nutation of $18''$, as $b^2 - a^2$ to $2 a b$; that is, as radius to the tangent of twice the obliquity of the ecliptic. This gives the greatest equation of precession $16''$, 8, not differing half a second from Bradley's observations.

Precession
||
Predestination.

Thus have we attempted to give some account of this curious and important phenomenon. It is curious, because it affects the whole celestial motions in a very intricate manner, and received no explanation from the more obvious application of mechanical principles, which so happily accounted for all the other appearances. It is one of the most illustrious proofs of Sir Isaac Newton's sagacity and penetration, which caught at a very remote analogy between this phenomenon and the libration of the moon's orbit. It is highly important to the progress of practical and useful astronomy, because it has enabled us to compute tables of such accuracy, that they can be used with confidence for determining the longitude of a ship at sea. This alone fixes its importance: but it is still more important to the philosopher, affording the most incontestable proof of the universal and mutual gravitation of all matter to all matter. It left nothing in the solar system unexplained from the theory of gravity but the acceleration of the moon's mean motion; and this has at last been added to the list of our acquisitions by Mr de la Place.

Quæ toties animos veterum torfere Sophorum,
Quæque scholas frustra rauco certamine vexant,
Obvia conspicimus, nube pellente Mathesi,
Jam dubios nulla caligine prægravat error
Queis superum penetrare domos, atque ardua cœli
Scandere sublimis genii concessit acumen.
Nec fas est propius mortali attingere divos.

Holley.

PRECIE, (*precus*, "early," the name of the 21st order in Linnæus's fragments of a natural method; consisting of primrose, an early flowering plant, and a few genera which agree with it in habit and structure, though not always in the character or circumstance expressed in the title. See BOTANY, p. 461 col. 2.

PRECIPITANT, in chemistry, is applied to any liquor, which, when poured on a solution, separates what is dissolved, and makes it precipitate, or fall to the bottom of the vessel.

PRECIPITATE, in chemistry, a substance which, having been dissolved in a proper menstruum, is again separated from its solvent, and thrown down to the bottom of the vessel, by pouring some other liquor upon it.

PRECIPITATION. See CHEMISTRY-INDEX.

PRECOGNITION, in Scots law. See LAW, Part III. n^o CLXXXVI. 43.

PRECORDIA, in anatomy, a general name for the parts situated about the heart, in the forepart of the thorax: as the diaphragm, pericardium, and even the heart itself, with the spleen, lungs, &c.

PREDECESSOR, properly signifies a person who has preceded or gone before another in the same office or employment; in which sense it is distinguished from ancestor.

PREDESTINATION, the decree of God, whereby he hath from all eternity unchangeably appointed *trine* whatsoever comes to pass; and hath more especially fore-ordained certain individuals of the human race to everlasting

Fig. 1. PRECESSION of the EQUINOXES Plate CCC CXIV.

**Predestina-
tion.** everlasting happiness, and hath passed by the rest, and fore-ordained them to everlasting misery. The former of these are called the *elect*, and the latter are called the *reprobate*.

2
**Not pecu-
liar to
Christiani-
ty.** This doctrine is the subject of one of the most perplexing controversies that has occurred among mankind. But it is not altogether peculiar to the Christian faith. The opinion, that whatever occurs in the world at large, or in the lot of private individuals, is the result of a previous and unalterable arrangement by that Supreme Power which presides over nature, has always been a favourite opinion among the vulgar, and has been believed by many speculative men. Thus, in that beautiful scene in the sixth book of the Iliad, Hector, taking leave of his wife and his child, speaks thus :

Andromache ! my soul's far better part,
Why with untimely sorrows heaves thy heart ?
No hostile hand can antedate my doom,
Till fate condemns me to the silent tomb.
Fix'd is the term to all the race of earth,
And such the hard condition of our birth.
No force can then resist, no flight can save,
All sink alike, the fearful and the brave. 1. 624.

The ancient Stoics, Zeno and Chrysippus, whom the Jewish Essenes seem to have followed, asserted the existence of a Deity that, acting wisely, but necessarily, contrived the general system of the world ; from which, by a series of causes, whatever is now done in it unavoidably results. This series, or concatenation of causes, they held to be necessary in every part ; and that God himself is so much the servant of necessity, and of his own decrees, that he could not have made the smallest object in the world otherwise than it now is, much less is he able to alter any thing.

According to the words of Seneca, *Eadem necessitas et Deos alligat. Irrevocabilis divina pariter atque humana cursus vehit. Ille ipse omnium conditor ac rector scripsit quidem fata sed sequitur. Semper parat, semel jussit.* "The same chain of necessity constrains both gods and men. Its unalterable course regulates divine as well as human things. Even he who wrote the Fates, the Maker and Governor of all things, submits to them. He did but once command, but he always obeys." The stoical fate differs, however, from the Christian predestination in several points. They regarded the divine nature and will as a necessary part of a necessary chain of causes ; whereas the Christians consider the deity as the Lord and Ruler of the Universe, omnipotent and free, appointing all things according to his pleasure. Being doubtful of the immortality of the soul, the Stoics could have no idea of the doctrine of election and reprobation ; nor did they ever doubt their own freedom or will, or power of doing good as well as evil, as we shall presently see the Christian predestinarians have done.

Mahomet introduced into his Koran the doctrine of an absolute predestination of the course of human affairs. He represented life and death, prosperity and adversity, and every event that befalls a man in this world, as the result of a previous determination of the one God who rules over all ; and he found this opinion the best engine for inspiring his followers with that contempt of danger which, united to their zeal, has extend-

ed the empire of their faith over the fairest portion of the habitable globe.

The controversy concerning predestination first made its appearance in the Christian church about the beginning of the fifth century †. Pelagius a British, and Cœlestius an Irish, monk, both lived at Rome during that period, and possessed great celebrity on account of their piety and learning. They taught that the opinion is false, which asserts, that human nature is necessarily corrupted by a depravity derived from our first parents.— They contended, that men are born at present in a state as pure as that in which Adam was originally created ; and that they are not less qualified than he was for fulfilling all righteousness, and for reaching the most sublime eminence of piety and virtue : that the external grace of God, which is given unto all, and attends the preaching of the gospel, is necessary to call forth the attention and exertions of men ; but that we do not want the assistance of any internal grace to purify the heart, and to give it the first impulse towards what is good. Having fled into Africa on account of the Goths, who at that time invaded Italy, A. D. 410, Cœlestius remained at Carthage as a Presbyter ; but Pelagius went into the East, where he settled, and prospered under the patronage of John bishop of Jerusalem, to whom his sentiments were agreeable. On the contrary, the celebrated Augustine, bishop of Hippo, strenuously asserted the depravity of human nature since the fall of the first man, the necessity of a special interposition of divine grace to enable us to do any one good action ; and consequently, that none could obtain salvation excepting those whom God has thought fit to elect, and upon whom he bestows this grace. The dispute was carried on with great zeal. Zozimus bishop of Rome decided at first in favour of Pelagius and Cœlestius, whose followers were called *Pelagians* ; but he afterwards altered his opinion : and by the activity of Augustine, the council of Ephesus was called, at which the opinion of his antagonists was formally condemned.

In the course of the same century, these opinions assumed a variety of forms and modifications. One party, called *Predestinarians*, carried Augustine's doctrine fully farther than he himself had ventured to do in express words ; and asserted, that God had not only predestinated the wicked to *punishment*, but also that he had decreed that they should commit those very *sins* on account of which they are hereafter to be punished.— Another party moderated the doctrine of Pelagius, and were called *Semipelagians*. Their peculiar opinion is expressed in a different manner by different writers ; but all the accounts sufficiently agree. Thus, some represent them as maintaining that inward grace is not necessary to the first beginning of repentance, but only to our progress in virtue. Others say, that they acknowledged the power of grace, but said that faith depends upon ourselves, and good works upon God ; and it is agreed upon all hands, that these Semipelagians held that predestination is made upon the foresight of good works. The assistance of Augustine, though then far advanced in life, was called in to combat these tenets, and he wrote several treatises upon the subject. In all these he strenuously maintained, that the predestination of the elect was independent of any foresight

narian.

of

Predestina-
tion.

of their good works, but was according to the good pleasure of God only; and that perseverance comes from God, and not from man. Thereafter the doctrine of Augustine, or St Austin as he is often called, became general. He was the oracle of the schoolmen. They never ventured to differ from him in sentiment; they only pretended to dispute about the true sense of his writings.

5
And all the
earliest re-
formers,
but more
especially
Calvin.

The whole of the earliest reformers maintained these opinions of Augustine. They assumed under Luther a more regular and systematic form than they had ever formerly exhibited. But as the Lutherans afterwards abandoned them, they are now known by the name of *Calvinistic Doctrines*, from John Calvin of Geneva. He asserted, that the everlasting condition of mankind in a future world was determined from all eternity by the unchangeable decree of the Deity, arising from his sole good pleasure or free will. Being a man of great ability, industry, and eloquence, Geneva, where he taught, and which was a free state, soon became the resort of all the men of letters belonging to the reformed churches, and was a kind of seminary from which missionaries issued to propagate the Protestant doctrines through Europe. Their success was such, that, excepting a part of Germany, the principles of all the reformed churches are professedly Calvinistic or predestinarian.

6
Rise of the
Arminians

* Relatio
Historica
de Origine
et Pro-
gressu Con-
trover-
siarum in
Præde-
stinatione
Philippi a
Limborch.

The opponents of the doctrine of predestination among the Protestants usually receive the appellation of *Arminians* or *Remonstrants*. They derive the first of these appellations from James Arminius, who was, A. D. 1602, appointed * professor of theology at Leyden. He was violently opposed by Gomer his colleague, and died A. D. 1609. After his death, the controversy was conducted with great eagerness on both sides. The Calvinists, however, gradually prevailed. A synod was called at Dort, A. D. 1618, to which the most celebrated divines of different countries were invited. There, in a great measure by the authority and influence of Maurice prince of Orange, the Arminians were condemned as heretics; for by this time ambitious and powerful men found themselves politically interested in this religious contest. The Arminians presented to this synod a remonstrance, containing a statement of their faith upon the subjects in dispute; and from this they derived the appellation of *Remonstrants*. This statement contained the following five articles: 1. That God from all eternity predestinated those to everlasting salvation whom he foresaw would believe in Christ unto the end of their lives; and predestinated obstinate unbelievers to everlasting punishment. 2. Jesus Christ died for the whole human race, and for every individual of it, but believers alone reap the benefit of his death. 3. No man can produce faith in his mind by his own free will, but it is necessary that man, who is by nature wicked and unfit for acting or thinking aright, should be regenerated by the grace of the Holy Spirit, imparted by God for Christ's sake. 4. This divine grace constitutes the source, the progress, and the fulfilment, of all that is good in man; but it is not irresistible in its operation. 5. Believers, by the assistance of the Holy Spirit, are abundantly fitted for every good work; but whether it is possible for those who have once been truly such to fall away, and to perish finally, is not clear,

and must be better inquired into by searching the fa-
cred scriptures.

Predestina-
tion.

In opposition to these, a counter-remonstrance was presented, containing the opinions of the Calvinists, which was approved of by the synod. The substance of it was afterwards adopted, and in nearly the same expressions, into the Confession of Faith compiled by the assembly of divines which met at Westminster, A. D. 1643, and which every clergyman and probationer for the ministry in Scotland is at present required to subscribe previous to his admission. To give as clear and as fair an idea as possible of the Calvinistic doctrine upon this head, we transcribe the following passage from that Confession: "God from all eternity did, by the most wise and holy counsel of his own will, freely and unchangeably ordain whatsoever comes to pass; yet so, as thereby neither is God the author of sin, nor is violence offered to the will of the creatures, nor is the liberty or contingency of second causes taken away, but rather established. Although God knows whatsoever may or can come to pass upon all supposed conditions; yet hath he not decreed any thing because he foresaw it as future, or that which would come to pass upon such conditions. By the decree of God, for the manifestation of his glory, some men and angels are predestinated unto everlasting life, and others are fore-ordained to everlasting death. These angels and men, thus predestinated and fore-ordained, are particularly and unchangeably designed; and their number is so certain and definite, that it cannot be either increased or diminished. Those of mankind that are predestinated unto life, God, before the foundation of the world was laid, according to his eternal and immutable purpose, and the secret council and good pleasure of his will, hath chosen, in Christ, unto everlasting glory, out of his mere free grace and love, without any foresight of faith, or good works, or perseverance in either of them, or any other thing in the creature, as conditions or causes moving him thereunto; and all to the praise of his glorious grace. As God hath appointed the elect unto glory, so hath he, by the eternal and most free purpose of his will, fore-ordained all the means thereunto. Wherefore, they who are elected, being fallen in Adam, are redeemed by Christ, are effectually called unto faith in Christ, by his spirit working in due season; are justified, adopted, sanctified, and kept, by his power through faith unto salvation. Neither are any other redeemed by Christ, effectually called, justified, adopted, sanctified, and saved, but the elect only. The rest of mankind, God was pleased, according to the unsearchable council of his own will, whereby he extendeth or withholdeth mercy as he pleaseth, for the glory of his sovereign power over his creatures, to pass by, and to ordain them to dishonour and wrath for their sin, to the praise of his glorious justice."

Calvinistic
doctrine of
predestina-
tion.

There are two kinds of Calvinists or Predestinarians, viz. the *Supralapsarians*, who maintain that God did originally and expressly decree the fall of Adam, as a foundation for the display of his justice and mercy; while those who maintain that God only *permitted* the fall of Adam, are called *Sublapsarians*, their system of decrees concerning election and reprobation being, as it were, subsequent to that event. But, as Dr Priestley justly remarks, if we admit the divine prescience, there

Predestina-
tion.9
Disputes in
the church
of Rome
on the
subje&.

is not, in fact, any difference between the two schemes; and accordingly that distinction is now seldom mentioned.

Nor is the church of Rome less agitated by the contest about predestination than the first Protestants were. The council of Trent was much perplexed how to settle the matter without giving offence to the Dominicans, who were much attached to the doctrine of Augustine, and possessed great influence in the council. After much dispute, the great object came to be, how to contrive such a decree as might give offence to nobody, although it should decide nothing. Upon the whole, however, they seem to have favoured the Semi-pelagian scheme. Among other things, it was determined, that good works are of themselves meritorious to eternal life; but it is added, by way of softening, that it is through the goodness of God, that he makes his own gifts to be merits in us. Catin revived at that council an opinion of some of the schoolmen, that God chose a small number of persons, such as the blessed virgin, the apostles, &c. whom he was determined to save without any foresight of their good works; and that he also wills that all the rest should be saved, providing for them all necessary means, but they are at liberty to use them or not. This is called the *Baxterian* scheme in England, from one of its promoters there. But at all events, the council of Trent seems to have been extremely anxious that any opinions entertained among them concerning predestination might have as little influence as possible upon practical morality. "Let no man (say they), while he remains in this mortal state, presume that he is among the number of the elect, and that therefore he cannot sin, or sin without repentance; for it cannot be known who are elected without a special revelation from God." Sess. 6. c. 13.

The Jesuits at first followed the opinion of Augustine; but they afterwards forsook it. *Molina*, one of their order, was the author of what is called the *middle scheme*, or the doctrine of a *grace sufficient for all men*, but subject to the freedom of the human will. *Janse-
nius*, a doctor of Louvain, opposed the Jesuits with great vigour, and supported the doctrine of Augustine. He wrote in a very artful manner. He declared, that he did not presume to state his own sentiments upon

he subject; he pretended only to explain and publish the sentiments of that great father of the church St Augustine. But the Jesuits, in consequence of that inviolable submission to the authority of the pope which they always maintained, had sufficient interest at Rome to procure the opinions of Janse-
nius to be condemned there; but with this addition subjoined, that nothing was thereby intended to be done in prejudice of the doctrine of St Augustine. This produced an absurd dispute about the pope's infallibility in matters of fact. The Janse-
nists affirmed, that the Pope had made a mistake in condemning the opinions of Janse-
nius as different from those of Augustine; whereas in truth they are the same, and the one cannot be condemned without the other. But the Jesuits affirmed, that the pope is no less infallible in points of fact than he is in questions of faith; and he having decided, that the opinions of Janse-
nius are different from those of St Augustine, every good Catholic is bound to believe accordingly that they are different. These disputes have never been fully settled, and still divide the Roman Catholic churches. Some of the ablest supporters of predestination have appeared among the Janse-
nists, and particularly among the gentlemen of Port-Royal.

With regard to Great Britain, the earliest English reformers were in general Sublapsarians, although some of them were Supralapsarians. But the rigid Predestinarians have been gradually declining in number in that church, although they still subscribe the 39 articles of their faith, which are unquestionably Calvinistic. The celebrated Scotch reformer John Knox having been educated at Geneva, established in his country the doctrine of predestination in its strictest form: and it has probably been adhered to with more closeness in Scotland than in any country in Europe.

Of late years, however, the dispute concerning predestination has assumed a form considerably different from that which it formerly possessed. Instead of being considered as a point to be determined almost entirely by the sacred scriptures, in the hands of a number of able writers, it has in a great measure resolved itself into a question of natural religion, under the head of the philosophical liberty or necessity of the will (A); or, whether all human actions are or are not necessarily determined

Predestina-
tion.10
English and
Scotch re-
formers
predestina-
rians.

(A) Dr Priestley, the most celebrated Necessarian of the age, has written a whole section of his *Illustrations*, with a view to show, that between "the two schemes of Calvinistic predestination and philosophical necessity, there is no sort of resemblance, except that the future happiness or misery of all men is certainly foreknown and appointed by God. In all other respects (says he) they are most essentially different; and even where they agree in the end, the difference in the manner by which that end is accomplished is so very great, that the influence of the two systems on the minds of those that adopt and act upon them is the reverse of one another."

The Calvinistic doctrine of predestination, according to a very authentic statement of that doctrine*, is, that * Shorter
"God, for his own glory, hath fore-ordained whatsoever comes to pass." The scheme of philosophical necessity, as stated by an intimate friend and warm admirer of Dr Priestley's, is, "That every thing is predetermined by the Divine Being; that whatever has been, must have been; and that whatever will be, must be; that all events are pre-ordained by infinite wisdom and unlimited goodness; that the will, in all its determinations, is governed by the state of mind; that this state of mind is in every instance determined by the Deity; and that there is a continued chain of causes and effects, of motives and actions inseparably connected, and originating from the condition in which we are brought into existence by the Author of our being." The author or compiler of the same book affirms. "That all motion indeed originates in the Deity; that the Deity is self-moved; that he possesses the singular attribute underived of moving himself." But it is added in the very same paragraph from which this last sentence is quoted, that "the very argument we employ to prove one underived source of motion, and

Catechism

minster.

**Predestina-
tion.** terminated by motives arising from the character which God has impressed on our minds, and the train of circumstances amidst which his providence has placed us? We have already discussed this point (See METAPHYSICS) by giving a candid statement of the arguments on both sides of the question. We shall treat the subject of predestination in the same manner, avoiding as far as possible any recapitulation of what has been advanced under the head of *NECESSITY and Liberty*.

11
**Points at
issue be-
tween the
predestina-
rians and
their oppo-
nents.** From what has been already said, it will appear that the points chiefly at issue between the parties are the following: First, With what views and purposes did God create the world and frame his decrees concerning mankind? Did he contrive a great unalterable scheme of creation and providence only for the sake of manifesting his own glory and perfections? Or did he first consider the free motions of those rational agents whom he intended to create, and frame his decrees upon the consideration of what they might choose or do in all the various circumstances in which he intended to place them?—The second and following questions are branches of this leading one. Did Christ die for a particular portion of the human race, who shall therefore certainly be saved? or was his death intended as a benefit to all, from which none are excluded excepting those who willingly reject it? Is the divine grace certainly and irresistibly efficacious in all those minds to which it is given? or does its effect depend upon the good use which men may or may not make of it? Can any good action be done without it? Do those who have once received it certainly persevere and obtain eternal salvation? or is it possible for any of them to fall away and perish finally?

12
**Arguments
for the doc-
trine.** We shall begin by stating the argument on the side of the predestinarians, and in the language which they commonly use. But it is necessary to make this previous remark, that the general * objections to their doctrine are, that it is hostile to all our ideas of the justice of God, representing him as a partial being, rewarding without merit, and punishing without sin; that it renders him the author of evil, destroys moral distinctions, makes useless every effort on our part, makes every prayer absurd, and even the preaching of the gospel vain; seeing that all things are immutably fixed, and none can believe or be saved excepting the elect, and they must certainly and at all events be safe. Against all this they reason thus.

The great and everlasting Author of all things existed from eternity alone, independent and essentially perfect. As there was no other, he could only consider himself and his own glory. He must therefore have designed all things in and for himself. To make him stay his determinations till he should see what free creatures would do, is to make him decree with uncer-

2

ainty, and dependently upon them, which falls short of infinite perfection. He existed alone, and his councils could have no object excepting himself; he could only then consider the display of his own attributes and perfection. In doing this, as the end is more important than the means, Divine Wisdom must begin its designs with that which is to come last in the execution of them; but the conclusion of all things at the last judgment will be the complete manifestation of the wisdom, the goodness, and justice, of God: we must therefore suppose, that, in the order of things, he decreed that first, although with him, in the order of time, there is no first nor second, but all is from eternity. When this great design was laid, the means were next designed. Creation, and its inhabitants of every order, form the means by which the author and disposer of all things accomplishes his will. But creatures in his sight are nothing, and are figuratively said to be less than nothing. We may entertain proud and elevated conceptions of our own dignity if we please; but if we in our designs regard not the dust on which we tread, or the lives of ants and insects, the omnipotent Lord of all, from whom we are more infinitely distant, must regard us as at least equally inconsiderable, and only valuable as we serve the accomplishment of his great and mysterious purposes, which cannot be us or our aggrandisement, but himself and his own glory.

13
**As necessa-
ry to ex-
plain the
Divine at-
tributes.** It is only by this view of the divine conduct that some of the attributes of God can be explained, or their existence rendered possible. In the scriptures he claims the attribute of *prescience* as his distinguishing prerogative: but there can be no prescience of future contingencies; for it involves a contradiction to say, that things which are not certainly to be should be certainly foreseen. If they are certainly foreseen, they *must* certainly be, and can therefore be no longer contingent. An uncertain foresight is also an imperfect act, as it may be a mistake, and is therefore inconsistent with divine perfection. On the other side the difficulty is easily explained. When God decrees that an event shall take place, its existence becomes thenceforth certain, and as such is certainly foreseen. For it is an obvious absurdity to say, that a thing happens freely, that is to say, that it may be or may not be, and yet that it is certainly foreseen by God. He cannot foresee things but as he decrees them, and consequently gives them a future certainty of existence; and therefore any prescience antecedent to his decree must be rejected, as impossible. Conditional decrees are farther absurd, inasmuch as they subject the purposes of God to the will and the actions of his creatures. Does he will, or wish that all mankind should be saved, and shall they not all be saved? Infinite perfection can wish nothing but what it can execute; and if it is fit to wish, it is also fit to execute its wishes. We are indeed certainly informed by the scrip-

and existence; is a gross solecism in logic; and that the ascription of this power to the Divine Being is in fact nothing else than the less of two palpable *absurdities* or rather *impossibilities*, if these could admit of degrees.†

The pety of these assertions will be obvious, we are persuaded, to every one of our readers; but to some it is possible that their consistency may not be apparent. We would advise all such “to peruse once and again Dr Priestley’s *Illustrations*,” which, we have the best authority to say, will remove from their minds all libertarian prejudices, convince them “that the hypothesis of necessity is incontrovertibly true,” and show them that all the defenders of that hypothesis are in perfect harmony with themselves and with one another!

tion.

14
Christ died
only for
the elect.

scriptures, that all shall not be saved; and we therefore as certainly conclude, that God never intended that they should be so; *for the counsel of the Lord standeth fast, and the thoughts of his heart, to all generations.*

We conclude upon the same principles, that although the blessings resulting from the death of Christ are offered to all, yet that intentionally and actually he only died for those whom the Father had chosen and given to him to be saved by him. That Christ should have *died in vain* is represented by the apostle Paul as a great absurdity (Gal. ii. 21.): but if he died for all, he must have died in vain with regard to the greater part of mankind who are not to be saved by him. In so far as some inferior blessings are concerned, which through him are communicated, if not to all men, at least to all Christians, he may perhaps justly be said to have died for all: but with regard to eternal salvation, his design, to avoid rendering it fruitless, could go no farther than the secret purpose and election of God. This is implied in these words, *all that are given me of my Father, thine they were, and thou gavest them me.* To these his intercession is limited; *I pray not for the world, but for those that thou hast given me; for they are thine, and all thine are mine, and mine are thine* (Jo. xvii. 9, 10.) Universal words are indeed used with regard to the death of Christ: but the reason is obvious, the Jewish religion was confined to the family and descendants of Abraham. In contradiction to this, the gospel is said to be preached to *every creature, and to all the world*; because it is not limited to any one race or nation, and because the apostles received a general commission to teach it unto all who should be willing to receive it. These extensive expressions can only be understood in this manner, because in their strict acceptance they have never been verified. Nor can their meaning be carried farther without an imputation upon the justice of God: for if he has received a sufficient satisfaction for the sins of the whole world, it is not just that all should not be saved by it, or at least have the offer of salvation made to them, that they may accept of it if they please.

But to return to the divine purposes and attributes in general: it is in vain to assert that God is partial and unjust while he prefers without merit, and predestinates to punishment those who have not yet offended. The same error misleads men here that has so often seduced them from the true path of scientific research. Instead of submitting to the patient and humble observation of nature, they boldly form some plausible hypothesis of their own, and vainly attempt to reconcile every appearance to their favourite system. This mode of procedure never has proved, and never will prove, successful in any branch of true philosophy. We are not entitled to frame to ourselves certain notions of the justice of God, and from these to decide that thus he must act and in no other manner. He takes no counsel from us concerning his conduct, and we have no right to rejudge his judgments. What he regards as just or unjust between himself and his creatures, is a question of fact not to be known by ingenious conjectures, but by the cautious observations of the manner in which he acts in the course of his providence, and by attending to what he has declared concerning himself in the sacred scriptures. If from these it shall appear that he does prefer where there is no merit, and reject where there is no crime; it will

VOL. XV.

be in vain thereafter to assert that such conduct is unjust: the fact will be on our side of the question, and we shall leave those to account for it who insist that their limited reason is capable of comprehending all the mysterious ways of an Infinite Being.

In the course of providence, then, we see the greatest inequalities take place, and such as appear altogether contradictory to our ideas of justice. We see the sins of the fathers punished in the persons of the children, who often derive debilitated bodies from the intemperance of their parents, and corrupted manners from the example of their vices. God frequently afflicts good men in this life for a great length of time, as in the case of Job, only for the manifestation of his own glory, that their faith and patience may be made manifest. Some sins are punished with other sins, and often with a course of severe miseries in the persons of those who never committed them. We may transfer this from time to eternity; for if God may do for a little time what is inconsistent with our notions, and with our rules of justice, he may do it for a longer duration: since it is as impossible that he can be unjust for a day as for all eternity: and the same inequality of management appears in the great as in the private affairs of this world. During many ages almost the whole human race were lost in the darkness of idolatry: even since the Christian religion came into the world, how few nations have received it; and of these few, the number is still smaller of those who have enjoyed it in tolerable purity. If we consider how many great nations remain under the delusion contrived by Mahomet; if we reflect upon the idolatry of the Indies and of China, and the superstition of the Greek church, and of the church of Rome—we shall find that very few nations have possessed the most ordinary means of grace. Even the blessings of civilization, of science, and of liberty, are so rarely scattered over the face of the earth, that it is to be regarded as a melancholy truth, that with a very few favoured exceptions the whole human race have hitherto been sunk in the depth of barbarism, ignorance, slavery, and idolatry. When the Arminians think fit to assert, then, that the doctrine of absolute decrees is contrary to their ideas of the impartiality and justice of God, we can only answer that we are sorry for them if they have formed ideas of the character of God which are contrary to the truth. We presume not * like them to call his attributes before the tribunal of our understandings; we only observe the ways of his providence, and declare that thus stands the fact. If he leaves whole nations in darkness and corruption, and freely chooses others to communicate the knowledge of himself to them, we need not be surprised if he act in the same manner with individuals. For surely the rejecting immense empires for so many ages is much more unaccountable than the selection of a few individuals, and the leaving others in ignorance and depravity. It is in vain to allege that he extends his mercy to those who make the best use of the dim light which they have. This does not remove the difficulty of a choice and a preference; as it cannot be denied that their condition is very deplorable, and that the condition of others is much more hopeful: so that the mysterious doctrine of election and reprobation is an unquestionable truth under the government of God, seeing that great numbers of men are born in such circumstances that it is morally impossible they should not pe-

swered.

† Ubi supra.

Nor are we left to common observation upon this point. The language of the sacred scriptures is positive and clear. The whole reasoning in the ninth chapter to the Romans resolves all the acts of God's justice and mercy, his *hardening* as well as his *pardonning*, into an absolute freedom and an unsearchable depth. More pointed expressions for this purpose can scarcely be conceived than those actually made use of. *For the children being not yet born, neither having done any good or evil, that the purpose of God according to election might stand, not of works, but of him that calleth, it was said, The elder shall serve the younger. As it is written, Jacob have I loved, but Esau have I hated. What shall we say then? Is there unrighteousness with God? God forbid. For he saith to Moses, I will have mercy on whom I will have mercy, and I will have compassion on whom I will have compassion, So then it is not of him that willeth, nor of him that runneth, but of God that sheweth mercy; for the scripture saith unto Pharaoh, Even for this same purpose have I raised thee up, that I might show my power in thee, and that my name might be declared throughout all the earth. Therefore hath he mercy on whom he will have mercy, and whom he will he hardeneth.* If any man shall still be sufficiently bold to declare that all this is contrary to what he is pleased to consider as just and impartial, we can only reply to him in the words of the celebrated John Calvin of Geneva†. *Tibi molestum est ac odiosum, Deum plus posse et facere, quam mens tua capiat; equali autem tuo interdum concedes, ut suo judicio fruatur. Et tu in tanto furere, Dei mentionem ullam facere audes?* "Is it painful to thee that the power and the works of God exceed thy limited capacity? Thou sometimes sufferest thine equal to judge of his own conduct for himself, and darest thou in thy folly to censure the ways of God?" Or rather we may reply in those words of the apostle Paul which immediately follow the passage already quoted. *Thou wilt say then to me, Why doth he yet find fault? for who hath resisted his will? Nay but, O man, who art thou that resistest against God? Shall the thing formed say to him that formed it, Why hast thou made me thus? Hath not the potter power over the clay; of the same lump to make one vessel unto honour, and another unto dishonour?* Let these passages, and even the whole of the chapter now alluded to, be explained in any manner that is judged proper, still their import with regard to the present argument will remain the same. If God loved Jacob so as to chuse his posterity to be his people, and rejected or hated Esau and his posterity, and this without regard to them or their future conduct, but merely in consequence of the purpose and design of his election; if by the same purpose the Gentiles were to be grafted upon that stock from which the once favoured Jews were cut off; it will follow, not only that the great and mysterious decree of final election is unsearchably free and absolute, but also that all the means of grace are granted or withheld in the same unlimited and free manner according to the sovereign will and good pleasure of God, independent of any foresight of merit on our part. The words of our Saviour express this: *I thank thee O Father, Lord of heaven and earth, because thou hast hid these things from the wise and prudent, and hast revealed them unto babes:* The reason of which is given in the following words, *Even so, Father, for so it seemed good in thy sight,* (Mat. xi. 26). The passage immediately preceding this, shows clearly that the

means of grace are not bestowed upon those who, it is foreseen, will make a good use of them; nor denied to those who will make a bad use of them. *Wo unto thee Chorazin, wo unto thee Bethsaida: for if the mighty works which were done in you had been done in Tyre and Sidon, they would have repented long ago in sackcloth and ashes.* But the passages in scripture are innumerable, which declare that the whole character and destiny of every man is the result of the counsel and uncontrouled determination of God. The expression is often repeated in the book of Exodus; *God hardened the heart of Pharaoh, so that he would not let his people go,* (Exod. iv. 21), &c. It is said, that *God has made the wicked man for the day of evil* (Prov. xvi. 4). On the other hand, it is said, *as many believed the gospel as were appointed to eternal life,* (Acts i. 48). Some are said to be *written in the book of life, of the Lamb slain from the foundation of the world* (Rev. xiii. 8). Every prayer that is used, or directed to be used, in scripture, is for a grace that opens our eyes, that turns the heart, that makes us to go, that leads us not into temptation, but delivers us from evil. All these expressions denote that we desire more than a power or capacity to act, such as is given to all men. Indeed we do not, and we cannot, pray earnestly for that which we know all men as well as ourselves possess at all times.

18
Sure effi-
cacy of
grace.

The *grace of God* is the medium by which his sovereign will and absolute decrees are accomplished. Accordingly, it is set forth in scripture by such expressions as clearly denote its sure efficacy; and that it does not depend upon us to use it or not at our pleasure. It is said to be a creation; *we are created unto good works, and we become new creatures:* It is called a regeneration, or a new birth; it is called a quickening and a resurrection, as our former state is compared to a feebleness, a blindness, and a death. God is said to *work in us both to will and to do:* *His people shall be willing in the day of his power: He will write his laws in their hearts, and make them to walk in them.* In a passage already quoted, the human race are compared to a mass of clay in the hands of the potter, who of the same lump makes at his pleasure vessels of honour and dishonour. These passages, and this last more particularly, prove that there is an absolute and a conquering power in divine grace; and that the love of God constrains us, as St Paul expresses himself. Our Saviour compares the union and influence that he communicates to believers to the union of an head with the members, and of a root with the branches, which imparts an internal, a vital, and an efficacious influence. The outward means may indeed be rejected, but this overcoming grace never returns empty: these outward means coming from God, the resisting of them is said to be the *resisting of God, the grieving or quenching of his spirit;* and in that sense we may resist the grace or favour of God; but we can never withstand him when he intends to overcome us; *For the foundation of God standeth sure, having this seal, The Lord knoweth them that are his,* (2 Tim. ii. 19). *Having predestinated us unto the adoption of children by Jesus Christ himself, according to the good pleasure of his will,* (Eph. i. 5).

19
Perseve-
rance of
the saints.

That the saints shall certainly persevere unto the end is a necessary consequence of absolute decrees and of efficacious grace: all depends on God. *He of his own will begat us;* and with him *there is no variableness nor shadow of turning: whom he loves, he loves to the end:* and he has promised that he will never leave nor forsake those to whom he becomes a God. Our Lord hath

Predestina-
tion.

hath said, *I give unto them eternal life, and they shall never perish; neither shall any pluck them out of my hand,* (Jo. x. 28.) Hence we must conclude, that *the purpose and calling of God is without repentance,* (Heb. xiii. 5.) And therefore, although good men may fall into great sins, yet of all those who are given by the father to the Son to be saved by him, none are lost: The conclusion from the whole is, that God did in himself, and for his own glory, foreknow a determinate number in whom he would be both sanctified and glorified. These he *predestinated* to be holy, conformable to the image of his son: they are to be *called*, not by a general calling in the sense of these words, *many are called, but few are chosen*; but to be *called according to his purpose*. He *justified* them upon their obeying that calling, and in the conclusion he will *glorify* them; for nothing can separate us from the love of God in Christ, (Rom. ix. 19.) And he is not less absolute in his decree of reprobation than he is in his election: for *ungodly men* are said to be *of old ordained to condemnation, and to be given up by God unto vile affections, and to be given over by him to a reprobate mind*.

20
Arguments
against the
doctrine
from the
attributes
of God.

THUS far we have defended the doctrine of predestination: we proceed next to state the arguments usually adduced in favour of the Arminian system.

God is just, holy and merciful. In speaking of himself in scripture, he is pleased to make appeals to the human understanding, and to call upon men to reason with him concerning his ways. The meaning of this is, that men may examine his actions and his attributes with that measure of intelligence which they possess, and they will be forced to approve of them; nay, he proposes himself to us as a pattern for our imitation. We are required to be holy as he is holy, and merciful as he is merciful: which is a proof that he accounts us not incapable of forming just notions at least of these attributes. What then can we think of a justice that shall condemn us for a fact that we never committed? that designs first of all to be glorified by our being eternally miserable, and which afterwards decrees that we shall commit sins to justify this previous decree of our reprobation? For if God originally designs and determines all things, and if all his decrees are certainly effected, it is inconceivable how there should be a justice in punishing that which he himself, by an antecedent and irreversible decree, appointed to be done. Or, setting justice aside, is it possible that a being of infinite holiness, and who is *of purer eyes than to behold iniquity*, would by an antecedent decree fix our committing so many sins, in such a manner that it is not possible to avoid them? He represents himself in the scriptures as *gracious, merciful, slow to anger, and abundant in goodness and truth*. It is often said, that *he desires that no man should perish, but that all should come to the knowledge of the truth*: this is even said with the solemnity of an oath, *As I live, saith the Lord, I take no pleasure in the death of sinners*. What sense can these words bear if we believe that God did by an absolute decree doom so many of them to everlasting misery? If all things that happen arise out of the absolute decree of God as their first cause, then we must believe that God takes pleasure both in his own decrees and in the execution of them, consequently that *he doth take pleasure in the death of sinners*; and this in express contradiction to the most positive language of scrip-

ture. Besides all this what are we to think of the truth of God, and of the sincerity of those offers of grace and mercy, with the exhortations and exhortations upon them that occur so frequently in scripture, if we can imagine that by antecedent acts he determined that all these should be ineffectual? In one word, are we to regard our existence as a blessing, and to look up with gratitude to that paternal goodness which has placed us in a land of hope, which formed our nature, weak indeed and exposed to many imperfections, but capable of rising by virtuous efforts and by a patient continuance in well-doing to excellence and to high and immortal felicity? or, are we to curse the hour in which we were born under the dominion of a master, who is not only severe, but absurd, and even adds insult to cruelty; who, after placing us in a goodly habitation, binds us hand and foot, locks the door, blocks up the windows, sets fire to the fabric, and then very mercifully calls upon us to come forth lest we perish?

It is not true that rational beings are nothing in the sight of their maker. Compared to his Almighty strength and uncreated existence, our powers do indeed diminish into weakness, and our years into a moment: yet although our interests may be unimportant in themselves, the attributes of God with which they are connected are far from being so. There was no necessity for his calling us into existence; but the instant he bestowed upon us that gift, and conferred upon us faculties capable of rising to happiness by the contemplation of himself and of his works, he became our parent, and granted to us a right to look up to him for protection and mercy, and to hope that our existence and our faculties were not bestowed in vain. Nor will he trample upon the just and reasonable hopes of the meanest of his creatures. He is watchful over our interests; he hath sent his Son to die for us; his providence has been exerted for no other purpose but to promote our welfare; and there is joy in heaven even over one sinner that repenteth. Let it be allowed, that the universe was formed for no other purpose but to promote the glory of God; that glory can surely be little promoted by the exertion of undistinguishing and blind acts of power, in the arbitrary appointment to eternal reprobation of millions of unresisting and undeserving wretches*. It is not more honourable to the Deity to conceive of him as the parent, guide, governor, and judge of free beings, formed after the likeness of himself, with powers of reason and self-determination, than to conceive of him, as the former and conductor of a system of conscious machinery, or the mover and controulor of an universe of puppets, many of whom he is pleased to make completely miserable? The most important and fundamental point of religion, considered as a speculative science, consists in our forming high and just ideas of God and of his attributes, that from them we may understand the maxims of true and perfect morality. But were we to attempt to form our own natures upon the idea of the divine character that is given us by the doctrine of absolute decrees, we would certainly become imperious, partial, and cruel; at least we should not readily learn the virtues of kindness, mercy, and compassion.

It is true that, setting aside predestination, it is not easy to show how future contingencies should be

* Corre-
spondence

Priestley.

21
The diffi-
culty of
preference
certainly
solved.

Predestina-
tion.

certainly foreseen; but it is obvious that such foresight involves no contradiction, (see METAPHYSICS, n° 308); and if the actions of men be free, we know from the train of prophecies, which in the sacred scriptures appear to have been made in one age and fulfilled in another, that contingencies are foreseen by that infinite Being who inhabiteth eternity, and to whom a thousand years are but as one day. The prophecies concerning the death and sufferings of Christ were fulfilled by the free acts of the Jewish priests and people: These men sinned in accomplishing that event, which proves that they acted with their natural liberty. From these and all the other prophecies both in the old and new Testament, it must be confessed that future contingencies were certainly foreknown, but where to found that certainty cannot be easily resolved. We doubt not, however, that we may safely refer it to the infinite perfection of the Divine mind. And it ought to be observed that this difficulty is of a very different nature from that to which our antagonists are reduced on their side of the argument. They are compelled to confess that they cannot reconcile their doctrine with the justice of God, an attribute the nature of which we clearly understand, and which is held forth to our imitation; whereas we are only at a loss how to explain the mode in which the divine prescience is exerted; an attribute which God claims as peculiarly his own, and which it is not to be expected that we should be able in the smallest degree to comprehend. We can go farther than this. Heaven hath given to man two revelations of itself. The one consists in the knowledge which we procure by the right use of our rational faculties; and the other is bestowed by means of the sacred scriptures. Without intending to derogate from the authority of inspiration, it is fair to assert, that we are *more certain* that God is the author and bestower of our reason, than that he is the author of the scriptures; at least it is certain that the last cannot contradict the first, because God cannot contradict himself. By the primary revelation from heaven then, that is, by our reason, we are informed that God is true, and just, and good. If an angel from heaven should preach a doctrine contrary to this, we are entitled to say with the apostle, *let him be accursed*. If our antagonists then should succeed in proving that the doctrine of absolute decrees, which represents the Deity as cruel and unjust, is contained in scripture, the consequence would be, not that we would believe it, for that is impossible, but that we should be reduced to the necessity of rejecting the authority of the scriptures, because they contradict the previous sure revelation of God, our reason. We believe that the doctrines contained in the scriptures are certainly true, because they were taught by those who wrought miracles and foretold future events in proof of their being inspired by the God of truth. But miracles and prophecy are *direct* evidences of nothing but the *power* and *wisdom* of their Author; and unless we know by other evidence, that this powerful and wise Being is likewise the father of truth and justice, we cannot be sure that the scriptures, notwithstanding their source, are any thing better than a tissue of falsehoods. The very arguments therefore by which predestination is supported, tend to sap the foundation of that revelation from which its advocates pretend to draw them. The case is very different when no doctrine is asserted that is not con-

22
Scripture
cannot con-
tradict the
clear dic-
tates of
reason.

tradictory to our reason, but only above it. For example, when we are told that God can create rational beings, that he attends without distraction to the minutest affairs that pass in a thousand worlds, that he knows all things, the past, the present, and the future, we do not presume that we comprehend how he can do all this: but there is nothing in it that contradicts our reason; we ourselves possess a certain degree of power, can attend at once to a certain number of objects, can in some cases form very sure conjectures about futurity, and we resolve all the rest into the infinite nature and perfections of God.

It is farther to be observed, that prescience does not make effects certain because they are foreseen; but they are foreseen because they are to be: so that the certainty of the prescience is not the cause, but the consequence of the certainty of the event. The Roman republic has fallen; but our knowledge or ignorance of that event does not render it more or less true and certain. That it was to fall, was as surely true before it happened as it is now; and had we known it beforehand, as many men of sense probably did, it would neither have fallen sooner nor later on that account. This shows that the knowledge which an intelligent being has of a past or future event need not have any influence upon the circumstances that produce that event.

On some occasions the scripture takes notice of a conditional prescience*. God answered David, that Saul would come to Keilah, and that the men of Keilah would deliver him up: yet both the one and the other rested upon the condition of his staying there; and he going from thence, neither of them ever happened. Such also was the † prophecy of Jonah, at the failure of which he was so absurdly offended: and such was Christ's saying, That those of Tyre and Sidon, Sodom and Gomorrah would have turned to him, if they had seen the miracles that he wrought in the towns of Galilee. Since, then, this prescience may be so certain that it can never err nor mislead the exertions of providence, and since by this, both the attributes of God are vindicated, and the due freedom of man is asserted, all difficulties seem to be thus easily removed.

With regard to the purpose of Christ's death, he is said to be the *propitiation for the sins of the whole world*; and the wicked are said to *deny the Lord that bought them*. His death, as to its extent, is set in opposition to the sins of Adam; so that as by the offence of one judgment came upon all men to condemnation, so by the righteousness of one the free gift came upon all men to justification of life, (Rom. v. 18.) The *all* on the one side must be as extensive as the *all* on the other: so, since *all* are concerned in Adam's sin, *all* must likewise be concerned in the death of Christ. To this we may add, that *all* men are commanded and required to believe that Christ died for their sins; but no man can be obliged to believe what is not true: he must therefore have died for *all*. The following passages express clearly the universality of the object of Christ's death. *If any man sin, we have an advocate with the Father, Jesus Christ the righteous: and he is the propitiation for our sins: and not for ours only, but also for the sins of the whole world, (1 Jo. ii. 1, 2.) The love of Christ constraineth us; because we thus judge, that if one died for all, then were all dead: and that he died for all, that they which live should*

tion. *God so loved the world that he gave his only begotten Son that whosoever believeth in him might not perish, but might have everlasting life. (Jo. iii. 16.)* tions, exhortations, reproofs, expostulations, encourage-
ments, and terrors. But to what purpose is it to speak

25
Freedom
essential to
moral a-
gents.

But a proper attention to the nature of man will set the justice of our argument in a still stronger point of view. It is obvious, that such an inward freedom as renders a man the master of his own conduct, and able to do or not do what he pleases, is so necessary to the morality of our actions, that without it they are neither good nor evil, neither capable of rewards nor punishments. Madmen, or men asleep, are not to be charged with the good or evil of what they do; therefore at least some small degree of liberty must be left us, otherwise why are we praised or blamed for our conduct? All virtue and religion, all discipline and industry, arise out of this as their first principle, that there is a power in us to govern our own thoughts and actions, and to raise and improve our faculties. If this is denied, all efforts, all education, all attention bestowed upon ourselves or others, become fruitless and vain. If a man accounts himself under an inevitable decree, as he will have little remorse for the evil he does while he imputes it to that inevitable force that constrains him, so he will naturally conclude that it is to no purpose for him to struggle with impossibilities. Men are sufficiently inclined to throw all censure off from themselves, and to indulge in indolence; and upon the doctrine of absolute predestination who can blame them, seeing that their efforts can be of no value?

26
Liberty or
necessity a
question
of fact.

Matter is inactive of itself, and only moves in consequence of its being acted upon by some other being. Man is possessed of a power to begin motion, and to determine it in any direction that he may judge proper. This power and this intelligence constitute his liberty, and form that image of God that is stamped upon his nature. Whether man possesses this power of acting originally and of himself, or whether he is incapable of forming any resolution, or making any effort, without being acted upon by a foreign cause, is not a point to be reasoned on or disputed about: it is a question of fact, which, as far as it can possibly be known, every man has it in his power to determine by the evidence of his own consciousness. We do aver, then, that every man is conscious that he is a free agent, and that it is not possible for the most staunch predestinarian that has ever yet appeared seriously and practically to convince himself of the contrary. It is not possible for a man in his senses to believe, that in all those crimes which men charge *themselves* with, and reproach *themselves* for, God is the agent; and that, properly speaking, they are no more agents than a sword is when employed to commit murder. We do indeed, on some occasions, feel ourselves hurried on so impetuously by violent passions, that we seem for an instant to have lost our freedom; but on cool reflection we find, that we both might and ought to have restrained that heat in its first commencement. We feel that we can divert our thoughts, and overcome ourselves in most instances, if we set seriously about it. We feel that knowledge, reflection, and proper society, improve the temper and disposition; and that ignorance, negligence, and the society of the worthless and abandoned, corrupt and degrade the mind. From all this we conclude, that man is free, and not under inevitable fate, or irresistible motions to good or

evil. This conclusion is confirmed by the whole style of scripture, which upon any other supposition becomes a solemn and unworthy mockery. It is full of persuasions, exhortations, reproofs, expostulations, encouragements, and terrors. But to what purpose is it to speak to dead men, to persuade the blind to see, or the lame to run? If we are under impotence till the irresistible grace comes, and if, when it comes, nothing can withstand it, what occasion is there for these solemn discourses which can have no effect? They cannot render us inexcusable, unless it were in our power to be improved by them; and to imagine that God gives light and blessings, which can do no good, to those whom he before intended to damn, only to make them more inexcusable, and for the purpose of aggravating their condemnation, gives so strange an idea of his character as it is not fit to express in the language that naturally arises out of it.

Our antagonists seem to have formed ideas of the divine perfection and sovereignty that are altogether false. There is no imperfection implied in the supposition that some of the acts of God may depend upon the conduct of his creatures. Perfection consists in forming the wisest designs, and in executing them by the most suitable means. The author of nature conducts the planets in their orbits with immutable precision according to fixed rules: but it would be absurd to pretend to manage free agents, or their affairs, in the same manner by mathematical or mechanical principles. The providence that is exerted over material objects is fixed and steady in its operations, because it is fit that material objects which cannot move of themselves should be moved in a regular manner: but free and intelligent beings enjoy a wider range, and ought not to be confined to a prescribed train of exertions; it may therefore be necessary that the providence which superintends them should accommodate itself to circumstances. This, however, is not injurious to the divine sovereignty; for God himself is the author of that freedom of agency which he is pleased to watch over. He is not less the Lord of the universe; and surely his wisdom and benevolence are more conspicuous when he brings good out of evil, and renders the perverse wanderings of the human heart subservient to purposes of mercy, than when he hurls into the immensity of space the most enormous mass of dead and passive matter subjected to unerring laws.

As for the inequalities of moral situation that are to be observed in the world, and the giving to some nations and persons the means of improvement, and the denying them to others, the scriptures do indeed ascribe these wholly to the riches and freedom of God's grace. And, we confess, that the ways of Providence are often dark and mysterious. In this world there are many things which are hard to be understood, and many which appear altogether unaccountable; we see the wicked man prospering in his wickedness, though it impose misery upon thousands; we see truth hiding its head, and the world governed by fraud and absurdity. Still, however, we can venture to assert, that God bestows upon all what is necessary to enable them to fulfil the obligations expected from the state in which they are placed; and it is elsewhere shown, that physical evil is among men the parent of moral good. (See PROVIDENCE). God winketh at the times of ignorance;

much is required of them to whom much is given; and it shall be more tolerable in the day of judgment for the inhabitants of Sodom and Gomorrah than for the enlightened cities of Galilee. Thus God will be just when he judges; none will meet with condemnation excepting those who are inexcusable. For although he grants more to some than may be absolutely necessary, yet he grants less to none; and where he grants little, he will suit his judgments to the little which he gave. There is no injustice in this. If it was the intention of the great Creator that his creation should contain within its ample bosom every possible variety of intelligent natures, it was necessary that there should be somewhere such a being as man; and, in forming all possible varieties of human minds and situations, it was necessary that every particular individual should exist. Hence a man may as well complain that he was not formed one of the flaming seraphims that furround the throne of the Eternal, as that he is not placed in other circumstances in life than those which he now occupies; for if little is given, little will be required from him. Thus the designs of Providence go on according to the goodness and mercy of God. None can complain, though some have more cause for joy than others. What happens to individuals may happen to nations in a body; some may have higher privileges, and be placed in happier circumstances than others; but none can complain of the wise and just disposer of all, who has given enough, although we may have good reason to complain of ourselves, for not using what was sufficient.

As to the case of those who are not blessed with the light of the gospel, we may consider, that if they have fewer and less advantages than others, their nature and capacities must likewise be inferior; to which their future state may be proportioned. God is not obliged to make all men equally perfect in the next world any more than in this; and if their capacity be rendered less than that of an ordinary *Christian*, a lower degree of happiness may fill it. However, we need not be extremely solicitous about their state, much less cast any ungrateful imputations on the Governor of the world for not having dealt so bountifully with them as he has with ourselves; since we know that Christ died for the whole race of mankind; that every one will at length be accepted according to that he has, and not according to that he has not; and that to whomsoever much is given, of him shall much be required? (B).

29
Scriptural
expressions
explained.

Upon these principles, we can easily explain all the passages in the New Testament concerning the *purpose*, the *election*, the *foreknowledge*, and the *predestination* of God. They relate to the design of calling the Gentile world to the knowledge of the Messiah: This was kept secret, though hints had been given of it by several of the prophets, so that it was a mystery; but it was revealed when the apostles, in consequence of Christ's commission, *to go and teach all nations*, went about preaching the gospel to the Gentiles. This was a stumbling-block to the Jews, and it was the chief subject of dispute betwixt them and the apostles at the

time when the Epistles were written: so that it was necessary for them to clear up this point very fully, and to mention it frequently. But in the beginning of Christianity there was no need of amusing men with high and unsearchable speculations concerning the decrees of God; the apostles therefore take up the point in dispute, the calling of the Gentiles in a general manner. They show, that Abraham at first, and Isaac and Jacob afterwards, were chosen by a discriminating favour, that they and their posterity should be in covenant with God; but that, nevertheless, it always was the intention of Providence to call in the Gentiles, though it was not executed till these later times.

With this key we can explain coherently the whole of St Paul's discourses upon this subject, without asserting antecedent and special decrees as to particular persons. Things that happen under a permissive and directing Providence, may, by a largeness of expression, be ascribed to the will and counsel of God; for a permissive will is really a will, though it is not the agent or cause of the effect. The *hardening of Pharaoh's heart* may be ascribed to God, though it is said that his *heart hardened itself*, because he took advantage of the respites which God granted him from the plagues, to encourage himself to longer resistance. Besides this, he was a cruel and bloody tyrant, and deserved such judgments for his other sins; so that he may be considered as at that time under final condemnation, and only preserved from the first plagues, to afford a striking instance of the avenging justice of God. That this is the meaning of the passage, appears extremely probable from the manner in which Exod. ix. 16. is rendered in the Vatican and Aldus's edit. of the LXX. Instead of saying, as in our translation, "And in very deed for this cause have I raised thee up, for to show in thee my power, &c." God is represented in that version as saying, "And in very deed for this cause have I kept thee alive till now, for to show," &c. *Whom he will he hardeneth*, is an expression that can only be applied to such persons as this tyrant was. It is obvious that the words of our Saviour concerning those *whom his Father had given him*, are only meant of a dispensation of Providence, and not of a decree; since he adds, *And I have lost none of them except the son of perdition*: for it cannot be said that Judas Iscariot was in the decree, and yet was lost. And in the same passage in which God is said *to work in us both to will and to do*, we are required *to work out our own salvation with fear and trembling*. The word *ordained* to eternal life also signifies fitted and disposed to eternal life. The question, *Who made thee to differ?* (1 Cor. iv. 7.) refers to those extraordinary gifts which, in different degrees and measures, were bestowed upon the first Christians, in which they were unquestionably passive.

If the decrees of God are not absolute, neither can³⁰ his grace be so efficacious as absolutely and necessarily irresistible. to determine our conduct, else why are we required *not to grieve God's spirit?* why is it said, *ye do always resist the Holy Ghost; as your fathers did, so do ye?* How often

(B) See Bishop Law's *Considerations on the Theory of Religion*, where this question is treated in a very masterly manner. The work, though less known than it ought to be, has great merit, and of the author we have given a biographical sketch in our ninth volume.

Predestina-
tion.

often would I have gathered you under my wings, and ye would not? What could I have done in my vineyard that has not been done in it? These expressions indicate a power in us, by which we not only can, but often do, resist the motions of grace. But if the determining efficacy of grace is not acknowledged, it will be much harder to believe that we are efficaciously determined to sin. This supposition is so contrary both to the holiness of God, and to the whole style of the sacred writings, that it is unnecessary to accumulate proofs of it. *O Israel, thou hast destroyed thyself, but in me is thy help: ye will not come unto me that ye may have life: Why will you die, O house of Israel?*

31
The great-
est saint on
earth may
fall.

As for perseverance, we may remark, that the many promises made in the sacred scriptures to them that overcome, that continue stedfast and faithful to the death, do certainly insinuate that a man may fall from a good state. The words of the apostle to the Hebrews are very clear and pointed: *For it is impossible for those who were once enlightened, and have tasted of the heavenly gift, and were made partakers of the Holy Ghost, and have tasted the good word of God, and the powers of the world to come, if they shall fall away, to renew them again unto repentance* (Heb. vi. 4.) It is also said, *The just shall live by faith: but if he draw (c) back, my soul shall have no pleasure in him*, (Heb. x. 38.) and it is said by the prophet, *When the righteous turneth away from his righteousness and committeth iniquity, all his righteousness that he hath done shall not be mentioned; in his sin that he hath sinned shall he die*, (Ezek. viii. 24). These passages, with many others, give us every reason to believe that a good man may fall from a good state, as well as that a wicked man may turn from a bad one.

32
All diffi-
culties
solved at
the day of
judgment.

We conclude the whole by observing, that the only difficulty which attends the question arises from the mysterious, and apparently partial and unequal, course of the divine government in our present state; but there is an important day approaching, when God will condescend to remove these obscurities, and to vindicate the ways of his providence to man. On that great day, we are well assured, that the question will be decided in our favour; for we know that judgment will be given, not according to any absolute decree, but, according to the deeds which we ourselves shall have freely done in the body, whether they have been good, or whether they have been evil.

Thus have we stated, we hope with fairness and impartiality, a summary of the arguments on both sides of this long agitated question. We need hardly add, that it is a question involved in considerable difficulties.—Milton, who was an eminent philosopher and divine, as well as the first of poets, when he wished to exhibit the fallen angels themselves as perplexed by questions above their comprehension, set them to dispute about predestination.

They reason'd high, of knowledge, will, and fate,
Fixed fate, free-will, fore-knowledge absolute;
And found no end, in wand'ring mazes lost.

Paradise Lost.

The weak side of the Calvinistic doctrine consists in the impossibility of reconciling the absolute and unconditional decree of reprobation with our ideas of the justice and goodness of God. The weak side of the Arminian scheme consists in the difficulty of accounting for the certainty of the divine foreknowledge, upon the supposition of a contingency of events, or an absolute freedom of will in man.

Predestina-
tion
||
Predial.

33
The weak
side of each
doctrine.

To elude the former of these difficulties, some of the late writers upon philosophical necessity, and Dr Priestly is among the number, have given up the doctrine of reprobation, and asserted, that this world is only a state of preparation for another, in which all men, of every description and character, shall attain to final and everlasting happiness, when God *shall be all, and in all*.—On the other side, some of the supporters of free agency, and Montesquieu * is among the number, have been disposed to deny the divine attribute of presci-

* Lettres
Perf.

ence. Whatever may be thought of the practical tendency of the two opinions, there is one remark which we think ourselves bound in justice to make, although it appears to us to be somewhat singular. It is this, that from the earliest ages down to our own days, if we consider the character of the ancient Stoics, the Jewish Essenes, the modern Calvinists, and Jansenists, when compared with that of their antagonists the Epicureans, the Sadducees, Arminians, and the Jesuits, we shall find that they have excelled in no small degree in the practice of the most rigid and respectable virtues, and have been the highest honour of their own ages, and the best models for imitation to every age succeeding. At the same time, it must be confessed, that their virtues have in general been rendered unamiable by a tinge of gloomy and severe austerity.

So far as the speculative foundation of their principles is considered, however, neither party seems liable to censure in a moral point of view. Each of them wishes to support, though in a different manner from the other, the honour of the divine character. The Calvinists begin their argument with the notion of infinite perfection, independency, and absolute sovereignty, and thence deduce their opinions; making every difficulty yield to these first and leading ideas. Their opponents are more jealous of the respect due to the divine attributes of justice, truth, holiness, and mercy, and deduce their sentiments from the idea which they have formed of these. Each party lays down general maxims that are admitted by the other, and both argue plausibly from their first principles. Dr Burnet, whom we have here followed very closely, justly observes †, that “these are great grounds for mutual charity and forbearance.”

† Exposi-
tion of the
39 articles.

(c) In our translation we read, “If any man draw back,” &c. &c.; but the words *any man* are not in the original and if they do do not make nonsense of the text, they must at least be acknowledged to obscure its meaning.

Predial
||
Pre exist-
ence.

PREDIAL-Tithes, are those that are paid of things arising and growing from the ground only; as corn, hay, fruit, &c.

PREDICABLE, among logicians, denotes a general quality which may be predicated, or asserted of several things: thus animal is predicable of mankind, beasts, birds, fishes, &c.

PREDICAMENT, among logicians, the same with category. See CATEGORY and PHILOSOPHY.

PREDICATE, in logic, that which, in a proposition, is affirmed or denied of the subject. In these propositions, *snow is white, ink is not white*; whiteness is the predicate, which is affirmed of snow, and denied of ink.

PRE-EMPTION, a privilege anciently allowed the king's purveyor, of having the choice and first buying of corn and other provisions for the king's house; but taken away by the statute 19 Car. II.

PREENING, in natural history, the action of birds cleaning, composing, and dressing their feathers, to enable them to glide more easily through the air. For this purpose they have two peculiar glands on their rump, which secrete an unctuous matter into a bag that is perforated, out of which the bird occasionally draws it with its bill.

PRE-EXISTENCE, a priority of being, or the being of one thing before another. Thus a cause, if not in time, is yet in nature pre-existent to its effect. Thus God is pre-existent to the universe. Thus a human father is pre-existent to his son. The Peripatetics, though they maintained the eternity of the world, were likewise dogmatical in their opinion, that the universe was formed, actuated, and governed, by a sovereign intelligence. See *Aristotle on the Soul*, and our articles CREATION and EARTH. See also the *Philosophical Essays of Dr. Isaac Watts*, and the *Principles of natural and revealed Religion*, by the Chevalier Ramsay, where the subject of the world's eternity is discussed. Mr Hume's speculations also, on this abstruse and arduous subject, had a greater tendency to dissipate its gloom than that philosopher himself could imagine.

The Peri-
patetics
maintained
the eternity
of the
world.

Pre-existence The pre-existence of the human soul to its corporeity of the real vehicle had been from time immemorial a prevailing opinion among the Asiatic sages, and from them was perhaps transferred by Pythagoras to the philosophy of the Greeks; but his metempsychosis, or transmigration of souls, is too trivial either to be seriously proposed or refuted. Nevertheless, from the sentiments of Socrates concerning the immortality of the soul, delivered in his last interview with his friends, it is obvious that the tenet of pre-existence was a doctrine of the Platonic school. If at any period of life, say these philosophers, you should examine a boy, of how many ideas, of what a number of principles, of what an extent of knowledge, will you find him possessed: these without doubt could neither be self-derived nor recently acquired. With what avidity and promptitude does he attain the knowledge of arts and sciences, which appear entirely new to him! these rapid and successful advances in knowledge can only be the effects of reminiscence, or of a fainter and more indistinct species of recollection. But in all the other operations of memory, we find retrospective impressions attending every object or idea which emerges to her view; nor does she ever suggest any thought, word, or action, without

informing us, in a manner equally clear and evident, that those impressions have been made upon our senses, mind, or intellect, on some former occasion. Whoever contemplates her progress, will easily discover, that association is her most faithful and efficacious auxiliary; and that by joining impression with impression, idea with idea, circumstance with circumstance, in the order of time, of place, of similarity or dissimilarity, she is capacitated to accumulate her treasures and enlarge her province even to an indefinite extent. But when intuitive principles, or simple conclusions, are elicited from the puerile understanding by a train of easy questions properly arranged, where is the retrospective act of memory, by which the boy recognises those truths as having formerly been perceived in his mind? Where are the crowds of concomitant, antecedent, or subsequent ideas, with which those recollections ought naturally to have been attended? In a word, where is the sense of personal identity, which seems absolutely inseparable from every act of memory? This hypothesis, therefore, will not support pre-existence. After the Christian religion had been considerably diffused, and warmly combated by its philosophical antagonists, the same doctrine was resumed and taught at Alexandria, by Platonic proselytes, not only as a topic constituent of their matter's philosophy, but as an answer to those formidable objections which had been deduced from the doctrine of original sin, and from the vices which stain, and from the calamities which disturb, human life: hence they strenuously asserted, that all the human race were either introduced to being prior to Adam, or pre-existent in his person; that they were not, therefore, represented by our first parents, but actually concurred in their crime, and participated their ruin.

4
Pre-exist-
ence taught
by Christi-
an Plato-
nists.

The followers of Origen, and such as entertained the notion of Pre-adamites*, might argue from the doctrine of pre-existence with some degree of plausibility, For the human beings introduced by them to the theatre of probation had already attained the capacity or dignity of moral agents; as their crime therefore was voluntary, their punishment might be just. But those who believe the whole human race created in Adam to be only pre-existent in their germs or stamina, were even deprived of this miserable subterfuge; for in these homunculi we can neither suppose the moral nor rational constitution unfolded. Since, therefore, their degeneracy was not spontaneous, neither could their sufferings be equitable. Should it be said that the evil of original sin was penal, as it extended to our first parents alone, and merely consequential as felt by their posterity, it will be admitted that the distinction between penal and consequential evil may be intelligible in human affairs, where other laws, assortments, and combinations than those which are simply and purely moral, take place. But that a moral government, at one of the most cardinal periods of its administration, should admit gratuitous or consequential evil, seems to us irreconcilable with the attributes and conduct of a wise and just legislator. Consequential evil, taken as such, is misery sustained without demerit; and cannot result from the procedure of wisdom, benignity, and justice; but must flow from necessity, from ignorance, from cruelty, or from caprice, as its only possible sources. But even upon the supposition of those who pretend that

istence re-
futed.

Preexist-
ence
Prefect.

that man was mature in all his faculties before the commission of original sin, the objections against it will still remain in full force: for it is admitted by all except the Samian sage, that the consciousness of personal identity which was felt in the pre-existence, is obliterated in a subsequent state of being.

Now it may be demanded, whether agents thus refuted for punishment have not the same right to murmur and complain as if they had been perfectly innocent, and only created for that dreadful catastrophe? It is upon this principle alone that the effects of punishment can be either exemplary or disciplinary; for how is it possible, that the punishment of beings unconscious of a crime should ever be reconciled either to the justice or beneficence of that intention with which their sufferings are inflicted? Or how can others be supposed to become wise and virtuous by the example of those who are neither acquainted with the origin nor the tendency of their miseries, but have every reason to think themselves afflicted merely for the sake of afflicting? To us it seems clear, that the nature and *rationale* of original sin lie inscrutably retired in the bosom of Providence; nor can we, without unpardonable presumption and arrogance, form the most simple conclusion, or attempt the minutest discovery, either different from or extraneous to the clear and obvious sense of revelation. This sense indeed may with propriety be extracted from the whole, or from one passage collated with another; but independent of it, as reason has no premises, she can form no deductions. The boldness and temerity of philosophy, not satisfied with contemplating pre-existence as merely relative to human nature, has dared to try how far it was compatible with the glorious and omniscient God. The Arians, who allowed the subordinate divinity of our Saviour, believed him pre-existent to all time, and before all worlds; but the Socinians, who esteemed his nature as well as his person merely human, insisted, that before his incarnation he was only pre-existent in the divine idea, not in nature or person. But when it is considered, that children do not begin to deduce instructions from nature and experience, at a period so late as we are apt to imagine; when it is admitted, that their progress, though insensible, may be much more rapid than we apprehend; when the opportunities of sense, the ardour, of curiosity, the avidity of memory, and the activity of understanding, are remarked—we need not have recourse to a pre-existent state for our account of the knowledge which young minds discover. It may likewise be added, that moral agents can only be improved and cultivated by moral discipline. Such effects therefore of any state, whether happy or miserable, as are merely mechanical, may be noxious or salutary to the patient, but can never enter into any moral economy as parts of its own administration. Pre-existence, therefore, in this view of it, whether rewarded or punished, without the continued impression of personal identity, affords no solution of original sin.

PREFACE, something introductory to a book, to inform the reader of the design, method, &c. observed therein, and generally whatever is necessary to the understanding of a book.

PREFECT, in ancient Rome, one of the chief magistrates who governed in the absence of the kings, consuls, and emperors.

This power was greatest under the emperors. His chief care was the government of the city, taking cog-

nizance of all crimes committed therein and within 100 miles. He judged capitally and finally, and even presided in the senate. He had the superintendence of the provisions, building, and navigation.

The prefect of modern Rome differs little from the ancient *præf. Eus.*, his authority only extending to 40 miles round the city.

PREFECT of the Prætorium, the leader of the pretorian bands destined for the emperor's guards, consisting, according to Dion, of 10,000 men. This officer, according to Suetonius, was instituted by Augustus, and usually taken from among the knights.

By the favour of the emperors his power grew very considerable; to reduce which, Constantine divided the prefecture of the prætorium into four prefectures, and each of these again he subdivided into civil and military departments, though the name was only reserved to him, who was invested with the civil authority, and that of *comes belli* given him who commanded the cohorts.

PREGADI, in history, a denomination given to the senate of Venice, in which resides the whole authority of the republic. At its first institution it was composed of 60 senators, to whom 60 more have been added. See **VENICE**.

PREGNANCY, the state of a woman who has conceived, or is with child. See **MIDWIFERY**.

PREHNITE, a stone so named by Mr Werner, inspector of the mines of Freyburg, brought by Colonel Prehn from the Cape of Good Hope. In the first volume of *Chemical Annals* there is a chemical analysis of this stone extracted from the *Acta Naturæ Curiosorum*, Berlin, tom. viii. p. 211. an. 1788, part 2. by Klaproth; from which it appears, that 100 parts of prehnite contain filice

			43½ grains.
Alumine	-	-	30½
Lime	-	-	18½
Oxyd of iron	-	-	5½
Water and air	-	-	1½
Total			100

Colonel Prehn gave it the name of emerald, and Mr Bruckmann adopted that denomination, but changed his opinion on considering that it had neither the hardness, the bright green colour, nor the property of crystallizing in hexagonal prisms like the emerald. The Dutch dealers call it *chrysoprasus* of the Cape; but chrysoprasus is nothing but quartz tinged green by the oxyd of nickel. Professor Haquet, in the 4th volume of the Berlin Transactions, has named it *crystallized prasus*. In the 8th volume, however, Mr Bruckmann considers it as a crystallized felspar. Mr Sage calls it *chrysolite*. Mr Rome de l'Isle classes it among the schoerls. To this classification Mr Klaproth objects, and is rather disposed with Mr Werner to consider it as a zeolite; on the whole, he thinks it may be conveniently ranked between zeolite and schoerl. Mr Haftenratz published in the *Journal de Physique* for February 1788 an analysis of the same stone, under the title of *Pierre Silice, ca'caire, d'amineuse, &c. &c. de couleur verte, &c.* And according to his results, which are somewhat different from those of Mr Klaproth, and obtained by a different process, it contains, filice 50, lime 23.4, alumine 20.4, oxyd of iron 4.9, water 0.9, magnesia 0.5=100. The specific gravity of this stone, according to the experiments of Mr Briffon, is 2.9423. The dissection of its crystals, made by Abbé Haüy and Mr Haftenratz, discovered

Prefect
Prehnite.

Prejudice. one angle of 60 degrees, as in schoerls; but it has hitherto been impossible to determine the others. The Abbé Haüy has convinced himself, that it bears no resemblance to zeolite in its crystals. This stone scratches glass, and is itself scratched by rock crystal.

1
Definition. PREJUDICE, or PREJUDGMENT, from *præ* and *judicium*, means a judgment formed beforehand, without examination; the preposition *præ* expressing an anticipation, not so much of time as of knowledge and due attention: thence the schoolmen have called it *anticipation* and a *preconceived opinion*.

2
Origin of Prejudice. Prejudice arises from the associating principle, which we have explained at large in another article (see METAPHYSICS, Part I. chap. 5.), and it is a weakness from which no human mind can be wholly free. Some are indeed much more than others under its influence; but there is no man who does not occasionally act upon principles, the propriety of which he never investigated; or who does not hold speculative opinions, into the truth of which he never seriously inquired. Our parents and tutors, yea our very nurses, determine a multitude of our sentiments: our friends, our neighbours, the custom of the country where we dwell, and the established opinions of mankind, form our belief; the great, the pious, the learned, and the ancient, the king, the priest, and the philosopher, are characters of mighty efficacy to persuade us to regulate our conduct by their practice, and to receive as truth whatever they may dictate.

The case cannot indeed be otherwise. The occasions of acting are so frequent, and the principles of action are so various, that were a man to investigate accurately the value of every single motive which presents itself to his mind, and to balance them fairly against each other, the time of acting would in most instances pass away long before he could determine what ought to be done; and life would be wasted in useless speculation. The great laws of religion and morality, which ought to be the general and leading principles of action, no man of science will take upon trust; but in the course of a busy life a thousand circumstances will occur in which we must act with such rapidity, that, after being satisfied of the lawfulness of what we are about to do, we must, for the prudence of it, confide entirely in the general customs of our country, or in the practice of other individuals placed in circumstances similar to ours. In all such cases, though we may act properly, we act from *prejudice*.

3
Its extensive dominion. But the dominion of prejudice is not confined to the actions of the man of business: it extends over the speculations of the philosopher himself, one half of whose knowledge rests upon no other foundation. All human sciences are related to each other (see PHILOSOPHY, n° 2), and there is hardly one of them in which a man can become eminent unless he has some general acquaintance with the whole circle; but no man could ever yet investigate for himself all those propositions which constitute the circle of the sciences, or even comprehend the evidence upon which they rest, though he admits them perhaps as truths uncontroversial. He must therefore receive many of them upon the authority of others, or, which is the same thing, admit them by *prejudice*.

To this reasoning it may be objected, that when a man admits as true abstract propositions, which, though

not self-evident, he cannot demonstrate, he admits them not by prejudice, but upon testimony, which has been elsewhere shown to be a sufficient foundation for human belief (see METAPHYSICS, n° 138.) The objection is plausible, but it is not solid; for testimony *commands* belief only concerning *events* which, falling under the cognizance of the senses, preclude all possibility of mistake; whereas abstract propositions, not self-evident, can be proved true only by a *process of reasoning* or by a *series of experiments*; and in conducting both these, the most vigorous mind is liable to mistake. When Sir Isaac Newton told the world that it was the fall of an apple which first suggested to him the general law of gravitation, he bore testimony to a fact concerning which he could not be mistaken; and we receive his testimony for the reasons assigned in the article referred to. When he lays down the method of obtaining the fluxion or momentum of the rectangle or product of two indeterminate quantities, which is the main point in his doctrine of fluxions, he labours to establish that method on the basis of demonstration; and whoever makes use of it in practice, without understanding that demonstration, receives the whole doctrine of the modern geometrical analysis, not as a matter of *fact* upon the credit of Sir Isaac's testimony, but as a system of abstract *truth* on the credit of his *understanding*: in other words, he is a fluxionist by *prejudice*.

In vain will it be said, that in mathematical demonstration there is no room for mistake; and that therefore the man who implicitly adopts the method of fluxions may be considered as relying upon the *veracity* of its author, who had no inducement to deceive him, and whose comprehension was confessedly greater than his. In fluxionary mathematics, which treat of matters of which it is extremely difficult, if not impossible, to have adequate and steady conceptions, the most comprehensive mind is liable to mistake: and it is well known that the celebrated bishop of Cloyne wrote his *Analyst* to prove that the incomparable author of the method of fluxions had committed *two mistakes* in his fundamental proposition, which balancing one another, produced a true conclusion by false reasoning. One or other of these great men, of whom the least was an eminent mathematician, must have been bewildered in his reasoning, and have fallen into error; and therefore whoever follows either of them implicitly without perceiving the error of the other, is unquestionably under the influence of prejudice. This is the case with the writer of the present article. He perceives not the error of Bishop Berkeley's reasoning, and yet he admits the doctrine of fluxions on the authority of Sir Isaac's demonstration. That demonstration, however, he pretends not to understand; and therefore he admits the doctrine through *prejudice*.

4
We have made these observations to point out the absurdity of the fashionable cry against the harbouring of any prejudices. To eradicate all prejudices from the human mind is impossible; and if it were possible, it would be very unwise: for we see that prejudice may exist on the side of truth as well as on that of falsehood; and that principles professed and believed by any individual may be useful and true, though he was brought to them not by a train of fair and candid reasoning, but through the medium of prepossession or authority. Indeed such is our nature, and such are the laws of association,

Impossible to eradicate all prejudices from the mind.

Prejudice. fociation, that many of our best principles, and our obligation to perform many of the most amiable of our duties in common life, must evidently be acquired in this way. From endearing associations, and authoritative instruction, we acquire a knowledge of our duty to our parents, and a facility in performing it, together with the first principles of religion, without a single effort of our own reason. Even when reason has begun to assert its power, and shows us the propriety of such duties, we are wonderfully assisted in performing them by the amiable prejudices which we had before acquired, and which now appear to be natural to us. He who has never had the advantage of such associations, and who acquires a knowledge of the duties suggested by them after he has come to years of discretion, and chiefly by the efforts of his own reason, will seldom, *cæteris paribus*, perform those duties with an energy and delight equal to that of the person who has. This remark appears to be confirmed by experience; for it is often found, that the children of the great, who have been given out to nurse in their infancy, and who have seldom been in the company of their parents till their reasoning faculties have been far advanced, are much less dutiful and affectionate than those in the middle or lower stations of life, who have scarcely ever been out of their parents company.

5
Which would not be wise if it were possible.

Would it then be wise, even if it were practicable, to dissolve all those associations which tend so powerfully to increase the mutual affections of parents and children? We cannot think that it would; as we believe it might be easily shown that public spirit springs out of private affection. Plato indeed held an opinion very different from ours; for in order to extend that affection which is usually lavished at home to the whole state, he proposed that children should be educated at the public expence, and never be permitted to know the authors of their being. But this is only one of the many visionary projects of that great man, of which daily experience shows the absurdity. In modern times, we are certain that less dependence is to be had upon the *patriotism* of the man who, for the love which he pretends to his country, can overlook or forget his own partial connections in it, than on him who, at the same time that he wishes his country well, is feelingly alive to all the endearments of kindred affection.

Such affection may be called *partial*, and very probably has its foundation in that which is the source of all our prejudices: but if it be properly trained in early life, it will gradually extend from our nearest relations to the persons with whom we associate, and to the place which not only gave us birth, but also furnished our youthful and most innocent enjoyments. It is thus that the *amor patriæ* is generated (see PASSION and PATRIOTISM), which in minds unseduced by false principles is exceedingly strong; and though a partial affection, is of the most general utility. It is this prejudice which reconciles the Laplander to his freezing snows, and the African to his burning sun; which attaches the native of the Highlands or of Wales as much to his mountains and rocks, as the apparently happier inhabitant of the southern counties of England is to the more fertile and delightful spot where he drew his first breath. And we find in fact, that when a native of Kent and a Scotch Highlander have in some distant corner of the world gained a competent fortune without

6
Good effects of some prejudices.

being corrupted by luxury, they return, the one to his hop-gardens, and the other to his mountains. Were this prejudice, for such it surely is, wholly eradicated from the human mind, it is obvious that large tracts of country which are now full of inhabitants would be totally deserted; and that the hungry barbarians, to make room for themselves, would exterminate the proprietors of more favourable climes. From an affection to our friends and to our country, we naturally contract an affection for that mode of government under which we live; and unless it be particularly oppressive to ourselves or any order of citizens, we come as naturally to prefer it to all other modes, whether it deserve that preference or not. This no doubt is prejudice, but it is a beneficial prejudice; for were the multitude, who are wholly incapable of estimating the excellencies and defects of the various modes of government, to become dissatisfied with their own, and rise in a mass to change it for the better, the most horrible consequences might justly be dreaded. Of this truth the present state of Europe affords too melancholy and convincing a proof. The man therefore who, under the pretence of enlightening the public mind and extirpating prejudices, paints to the illiterate vulgar, in aggravated colours, the abuse of that government which has hitherto protected them from the ferocity of each other, is one of the greatest criminals if his views be selfish, and one of the worst reasoners if they be disinterested, that human imagination can easily conceive.

With the selfish patriot we have at present no concern: but we may with propriety ask the disinterested lover of truth, whether he thinks it possible, that in a large community, of which nine-tenths of the members are necessarily incapable of taking comprehensive views of things, or feeling the force of political reasonings, any form of government can be acceptable to the people at large, which does not gain their affections through the medium of prejudice? It has been shown by Mr Hume with great strength of argument, that government is founded on *opinion*, which is of two kinds, viz. opinion of interest, and opinion of right. By opinion of interest, he understands the sense of the general advantage which is reaped from government, together with the persuasion that the particular government which is established is equally advantageous with any other that could easily be settled. The opinion entertained of the *right* of any government is always founded in its antiquity; and hence arises the passionate regard which under ancient monarchies the people have for the heir of their royal family. These opinions, as held by the philosopher conversant with the history of nations, are founded upon reasoning more or less conclusive; but it is obvious, that in the minds of the multitude they can have no other foundation than prejudice. An illiterate clown or mechanic does not *see how* one form of government promotes the general interest more than another; but he may *believe* that it does, upon no other evidence than the declamation of a demagogue, who, for selfish purposes, contrives to flatter his pride. The same is the case with respect to the rights of hereditary monarchy. The anatomist finds nothing more in the greatest monarch than the meanest peasant, and the moralist may perhaps frequently find less; but the true philosopher acknowledges his right to the sovereignty: and though he be weak in understanding, or infirm in years, would, for

Prejudice.

7
Danger of improper attempts to remove them.

Prejudice.

the sake of public peace and the stability of government, maintain him in his throne against every competitor of the most shining talents. The vulgar, however, who would act with this philosopher, are influenced by no such views, but merely by their prejudices in favour of birth and family; and therefore it is ridiculous to think of changing the public mind with respect to any form of government by pure reasoning. In France a total change in the minds of the people has indeed been effected, and from the most violent prejudices in favour of royalty, they have now become more violently prejudiced in favour of republicanism. Bad as their government unquestionably was, the change that has now taken place is not the effect of calm reasoning and accurate inquiry (for of that the bulk of mankind appears to be incapable), nor are their prejudices less violent than they were before. They are changed indeed; but no one will deny that prejudice, and that of the most violent kind, leads them on at present; nor can any one assert that their new prejudices have rendered them more happy, or their country more flourishing, than their former ones, which made them cry *Vive le Roi* under the tyrannic government of Louis XIV.

The influence of prejudice is not more powerful in fixing the political opinions of men, than in dictating their religious creed. Every child of a religious father receives his faith by inheritance long before he be capable of judging whether it be agreeable or disagreeable to the word of God and the light of reason. This experience shows to be the fact; and sound philosophy declares that it cannot be otherwise. Parents are appointed to judge for their children in their younger years, and to instruct them in what they should believe, and what they should practise in the civil and religious life. This is a dictate of nature, and doubtless would have been so in a state of perfect innocence. It is impossible that children should be capable of judging for themselves before their minds are furnished with a competent number of ideas, and before they are acquainted with any *principles* and *rules* of just reasoning; and therefore they can do nothing better than run to their parents, and receive their directions what they should believe and what they should practise.

This mode of tutoring the infant mind, and giving to our instructions the force of prejudice, before reason can operate with much effect, will, we know, be highly displeasing to many who challenge to themselves alone the epithet of liberal. With them it will be cramming the genius and perverting the judgment: but we cannot help thinking that such an objection, if it should be made, would be the offspring of ignorance; for it requires but very little knowledge of human nature to be able to see, that if children be not restrained by authority, and if we do not insinuate a love of good principles into their minds, bad ones will insinuate themselves, and a little time will give *them* the force of inveterate prejudice, which all the future efforts of reason and philosophy will find it difficult to eradicate. The idea of keeping a child ignorant of the being of a God, and the grand duties of morality and religion, till he shall come to years of discretion, and then allowing him to reason them out for himself, is an absurd chimera: it is an experiment which never has been tried, which to us it appears impossible to try, and which, if it could be tried, could not possibly produce any good effect. For sup-

pose we had a youth just arrived at years of discretion, totally ignorant of all these things, and unbiassed to any system of opinions, or rather possessed of no opinions at all—it would, in the first place, we suspect, be absolutely necessary to direct his thoughts into a particular train, and for some person to lead him on from one idea to another, till he should arrive at some conclusion: but in all this there is the influence of authority, association, and of prejudice.

It being therefore absolutely necessary that sentiments of religion be instilled into the minds of children before they be capable of discovering by the use of their reason whether those sentiments be just or not, it need not excite wonder, nor is it any reflection upon religion, that most men adhere with bigotry to the creed of their fathers, and support that creed by arguments which could carry conviction to no minds but their own. The love and veneration which they bear to the memory of those from whom they imbibed their earliest opinions, do not permit them to perceive either the falsehood of those opinions, or their little importance, supposing them true. Hence the many frivolous disputes which have been carried on amongst Christians; and hence the zeal with which some of them maintain tenets which are at once contrary to scripture, to reason, and to common sense. A due reflection, however, on the source of all prejudices ought to moderate this zeal; for no man is wholly free from that bias which he is so ready to condemn in others: and indeed a man *totally free from prejudice*, would be a more unhappy being than the most violent bigot on earth. In science, he would admit nothing which he could not himself demonstrate; in business, he would be perpetually at a stand for want of motives to influence his conduct: he could have no attachment to a particular country; and therefore must be without patriotism, and without the solaces of friendship; and his religion, we are afraid, would be cold and lifeless.

What, it will be said, are the authors of a work which professes to enlighten the public mind by laying before it a general view of science and literature, become at last the advocates of *prejudice*, which is the *bane* of science, and the *prop* of *superstition*? No, we are advocates for no prejudice which is either inimical to science or friendly to absurdity; but we do not think that the moralist would act wisely who should desert his proper business to make himself master of the higher mathematics, merely that he might not be obliged to trust occasionally to the demonstrations of others. The writer of this article is not skilled in trade; but it is not his opinion that the merchant would soon grow rich, who should never make a bargain till he had previously calculated with mathematical exactness all the probabilities of his gain or loss. That to dissolve all the associations which are the source of partial attachments of kindred, affection, and private friendship, would tend to promote the public happiness, we cannot possibly believe. And whether or not the experience of the present day confirms Mr Hume's opinion, that far from endeavouring to extirpate the people's prejudices in favour of birth and family, we should cherish such sentiments, as being absolutely requisite to preserve a due subordination in society, we pretend not to determine; but that men should be better Christians if they were to receive no religious instruction till they should be able by their own reason

Prejudice.

9
Origin of
bigotry.

10
An objec-
tion an-
swered.

Prejudice. to judge of its truth, daily observation does not warrant us to conclude; for we see those who have seldom heard of God when children, "live without him in the world" when they are men.

Pernicious prejudices we have traced to their source elsewhere, and shown how they may be best prevented by proper attention in the education of children. See METAPHYSICS, n^o 98). We shall only add here, that the earlier such attention is paid, the more effectual it will be found; and that it is much easier to keep prejudices out of the mind than to remove them after they have been admitted. This however must be sometimes attempted; and where prejudices are strong, several methods have been recommended for rendering the attempt successful. The following are taken mostly from Dr Watts's improvement of the mind.

II
Proper methods of removing prejudices,

1. Never attack the prejudice *directly*, but lead the person who is under its influence step by step to the truth. Perhaps your neighbour is under the influence of *superstition and bigotry in the simplicity of his soul*; you must not immediately run upon him with violence, and show him the absurdity or folly of his own opinions, though you might be able to set them in a glaring light; but you must rather begin at a distance, and establish his assent to some familiar and easy propositions, which have a tendency to refute his mistakes, and to confirm the truth; and then silently observe what impression this makes upon him, and proceed by slow degrees as he is able to bear, and you must carry on the work perhaps at distant seasons of conversation. The tender or diseased eye cannot bear a deluge of light at once.

Overbassiness and vehemence in arguing is oftentimes the effect of *pride*; it blunts the poignancy of the argument, breaks its force, and disappoints the end. If you were to convince a person of the falsehood of the doctrine of *transubstantiation*, and you take up the consecrated bread before him and say, "You may see, and taste, and feel, *this is nothing but bread*"; therefore whilst you assert that God commands you to believe *it is not bread*, you most wickedly accuse God of commanding you to tell a lie." This sort of language would only raise the indignation of the person against you, instead of making any impressions upon him. He will not so much as think at all on the argument you have brought, but he rages at you as a *profane wretch*, setting up your own sense and reason above sacred authority; so that though what you affirm is a truth of great evidence, yet you lose the benefit of your whole argument by an ill management, and the unreasonable use of it.

2. Where the prejudices of mankind cannot be conquered at once, but will rise up in arms against the evidence of truth, there we must make some allowances, and yield to them for the present, as far as we can safely do it without real injury to truth; and if we would have any success in our endeavours to convince the world, we must practise this complaisance for the benefit of mankind. Take a student who has deeply imbibed the principles of the *Peripatetics*, and imagines certain immaterial beings, called *substantial forms* to inhabit every herb, flower, mineral, metal, fire, water, &c. and to be the spring of all its properties and operations; or take a Platonist, who believes an *anima mundi*, "an universal soul of the world," to pervade all bodies, to act in and by them according to their nature, and indeed to give them their nature and their special

powers; perhaps it may be very hard to convince these persons by arguments, and constrain them to yield up those fancies. Well then, let the one believe his *universal soul*, and the other go on with his notion of *substantial forms*, and at the same time teach them how by certain original laws of motion, and the various sizes, shapes, and situations of the parts of matter, allowing a continued divine concurrence in and with all, the several appearances in nature may be solved, and the variety of effects produced, according to the corpuscular philosophy, improved by *Descartes*, *Mr Boyle*, and *Sir Isaac Newton*; and when they have attained a degree of skill in this science, they will see these airy notions of theirs, these imaginary powers, to be so useless and unnecessary, that they will drop them of their own accord. The *Peripatetic forms* will vanish from the mind like a dream, and the *Platonic soul of the world* will expire.

We may give another instance of the same practice, where there is a prejudicate fondness of particular words and phrases. Suppose a man is educated in an *unhappy form of speech*, whereby he explains some *great doctrine of the gospel*, and by the means of this phrase he has imbibed a very false idea of that doctrine; yet he is so bigotted to his form of words, that he imagines if those words are omitted the form is lost. Now, if we cannot possibly persuade him to part with his improper terms, we will indulge them a little, and try to explain them in a scriptural sense, rather than let him go on in his mistaken ideas. A person who has been bred a *Papist*, knows but little of religion, yet he resolves never to depart from the *Roman Catholic faith*, and is obstinately bent against a change. Now it cannot be unlawful to teach such an one the true Christian, *i. e.* the *Protestant religion*, out of the *Epistle to the Romans*, and show him that the same doctrine is contained in the *Catholic Epistles of St Peter, James, and Jude*; and thus let him live and die a good Christian in the belief of the religion taught him out of the New Testament, while he imagines he is a *Roman Catholic* still, because he finds the doctrine he is taught in the *Catholic Epistles* and in that to the *Romans*. Sometimes we may make use of the very prejudices under which a person labours, in order to convince him of some particular truth, and argue with him upon his own professed principles as though they were true. Suppose a *Jew* lies sick of a fever, and is forbid flesh by his physician; but hearing that rabbits were provided for the dinner of the family, desired earnestly to eat of them; and suppose he became impatient, because his physician did not permit him, and he insisted upon it that it could do him no hurt—surely rather than let him persist in that fancy and that desire, to the danger of his life, we might tell him that these animals were strangled, a sort of food forbidden by the Jewish law, though we ourselves might believe that law to be abolished.

Where we find any person obstinately persisting in a mistake in opposition to all reason, especially if the mistake be very injurious or pernicious, and we know this person will hearken to the sentiment or authority of some favourite name; it is needful sometimes to urge the *opinion and authority* of that favourite person, since that is likely to be regarded much more than *reason*. We are almost ashamed indeed to speak of using any *influence of authority* in reasoning or argument; but in some cases

Prejudice.

Prejudice
||
Præmon-
strantes.

cases it is better that poor, silly, perverse, obstinate creatures, should be persuaded to judge and act right, by a veneration for the sense of others, than to be left to wander in pernicious errors, and continue deaf to all argument, and blind to all evidence. They are but children of a larger size; and since they persist all their lives in their minority, and reject all true reasoning, surely we may try to persuade them to practise what is for their own interest by such childish reasons as they will hearken to. We may overaw them from pursuing their own ruin by the terrors of a solemn shadow, or allure them by a sugar plum to their own happiness. But after all, we must conclude, that wheresoever it can be done, it is best to *remove and root out those prejudices* which obstruct the entrance of truth into the mind, rather than to palliate, humour, or indulge them; and sometimes this must necessarily be done, before you can make a person part with some beloved error, and lead him into better sentiments.

12
Mutual
forbear-
ance recom-
mended.

On the whole, we would recommend more mutual forbearance and less acrimony than is commonly found among writers on disputed subjects, as the only means by which our differences in religion, politics, and science, ever can be healed, and truth certainly discovered. If men were less violent in defending their particular opinions, they would always gain a more patient hearing, they would be less suspected of, and less liable to, prejudice, and of course more apt either to convince or to be convinced. They would likewise by so doing show, in the most unequivocal manner, their attention to sound philosophy, and above all to genuine Christianity; which, though it is far from encouraging scepticism, or a temporizing spirit, recommends, in the strongest terms, among all its professors, *universal charity and mutual forbearance*. See PROBABILITY, TRUTH, and SUPERSTITION.

PRELATE, an ecclesiastic raised to some eminent and superior dignity in the church; as bishops, archbishops, patriarchs, &c.

PRELIMINARY, in general, denotes something to be examined and determined before an affair can be treated of to the purpose.

PRELUDE, in music, is usually a flourish or irregular air, which a musician plays off-hand, to try if his instrument be in tune, and so lead him into the piece to be played.

PREMISSSES, in logic, an appellation given to the two first propositions of a syllogism. See LOGIC.

PREMISSES, in law, properly signifies the land, &c. mentioned in the beginning of a deed.

PREMIUM, or PRÆMIUM, properly signifies a reward or recompense: but it is chiefly used in a mercantile sense for the sum of money given to an insurer, whether of ships, houses, lives, &c. See INSURANCE.

PREMNA, in botany; a genus of the angiospermia order, belonging to the didynamia class of plants. The calyx is bilobed; the corolla quadrifid; the berry quadrilocular; the seeds solitary.

PREMONSTRANTES, or PRÆMONSTRATENSES, a religious order of regular canons instituted in 1120, by S. Norbert; and thence also called *Norbertines*.

The first monastery of this order was built by Norbert in the Isle of France, three leagues to the west of Laon; which he called *Præmonstre, Præmonstratum*, and

hence the order itself derived its name; though as to the occasion of that name, the writers of that order are divided. At first the religious of this order were so very poor, that they had only a single ass, which served to carry the wood they cut down every morning, and sent to Laon in order to purchase bread. But they soon received so many donations, and built so many monasteries, that in 30 years after the foundation of the order, they had above 100 abbeys in France and Germany: and in process of time the order so increased, that it had monasteries in all parts of Christendom, amounting to 1000 abbeys, 300 provostships, a vast number of priories, and 500 nunneries. But they are now greatly diminished. The rule they followed was that of St Augustine, with some slight alterations, and an addition of certain severe laws, whose authority did not long survive their founder.

The order was approved by Honorius II. in 1126, and again by several succeeding popes. At first the abstinence from flesh was rigidly observed. In 1245, Innocent IV. complained of its being neglected to a general chapter. In 1288, their general, William, procured leave of pope Nicholas IV. for those of the order to eat flesh on journeys. In 1460, Pius II. granted them a general permission to eat meat, excepting from Septuagesima to Easter. The dress of the religious of this order is white, with a scapulary before the cassock. Out of doors they wear a white cloak and white hat; within, a little camail; and at church, a surplice, &c.

In the first monasteries built by Norbert, there was one for men and another for women, only separated by a wall. In 1137, by a decree of a general chapter, this practice was prohibited, and the women removed out of those already built, to a greater distance from those of the men.

The Præmonstratenses, or monks of Premontre, vulgarly called *white canons*, came first into England, A. D. 1146. Their first monastery, called *New-house*, was erected in Lincolnshire, by Peter de Saulia, and dedicated to St Martial. In the reign of Edward I. this order had 27 monasteries in England.

PRENANTHES, in botany: A genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is naked; the calyx calyculated; the pappus is simple, and almost sessile; the florets are placed in a single series.

PRENOMEN, PRÆNOMEN, among the ancient Romans, a name prefixed to their family name, and answering to our Christian name: such are Caius, Lucius, Marcus, &c.

PRENOTION, PRÆNOTIO, or *Præcognitio*, is a notice or piece of knowledge preceding some other in respect of time. Such is the knowledge of the antecedent, which must precede that of the conclusion. It is used by Lord Bacon for breaking of an endless search, which he observes to be one of the principal parts of the art of memory. For when one endeavours to call any thing to mind, without some previous notion or perception of what is sought for, the mind exerts itself and strives in an endless manner: but if it hath any short notion before-hand, the infinity of the search is presently cut off, and the mind hunts nearer home, as in an inclosure. Thus verse is easier remembered than prose; because if we stick at any word in a verse, we have

Præmon-
strantes
||
Prenotion.

Prepara-
tion.

have a previous notion that it is such a word as must stand in a verse. Hence also, order is a manifest help to memory; for here is a previous notion, that the thing sought for must be agreeable to order. Bacon's *Works Abr.* vol. i. p. 136. and vol. ii. p. 473.

PREPARATION, in a general sense, the act of disposing things in such a manner as to render any foreseen event more advantageous or less hurtful according to its nature.

PREPARATION of *Dissonances*, in music, is their disposition in harmony in such a manner, that, by something congenial in what precedes, they may be rendered less harsh to the ear than they would be without that precaution; according to this definition, every discord ought to be prepared. But when, in order to prepare a dissonance, it is exacted that the sound which forms it should before have formed a consonance, then there is fundamentally but one single dissonance which is prepared, viz. the seventh. Nor is even this preparation necessary in the chord which contains the sensible note, because then the dissonance being characteristic, both in its chord and in its mode, the ear has sufficient reason to expect it: it accordingly does expect it, and recognise it; nor is either deceived with respect to its chord nor its natural progress. But when the seventh is heard upon a fundamental sound which is not essential to the mode, it ought then to be prepared, in order to prevent all ambiguity; to prevent the ear, whilst listening to this note, from losing its train: and as this chord of the seventh may be inverted and combined in several different manners, from this arise likewise a number of different ways by which it may seem to be prepared, which, in the main, always issue however in the same thing.

In making use of dissonances, three things are to be considered; viz. the chord which precedes the dissonance, that in which it is found, and that which is immediately subsequent to it. Preparation only respects the two first; for the third see RESOLUTION.

When we would regularly prepare a discord in order to arrive at its chord, we must choose such a career of the fundamental bass, that the sound which forms the dissonance may be a protraction into the perfect time of the same note which formed a consonance formerly struck in the imperfect in the preceding chord; this is what we call *syncopation*. See SYNCOPATION.

From this preparation two advantages result; viz. 1. That there is necessarily an harmonical connection between the two chords, since that connection is formed by the dissonance itself; and, 2. That this dissonance, as it is nothing else but the continuation of the same sound which had formed a consonance, becomes much less harsh to the ear than it would have been with any sound recently struck. Now this is all that we expect to gain by preparation. See CADENCE, DISCORD, and HARMONY.

By what has been just said, it will appear that there is no other part peculiarly destined for preparing the dissonance, except that in which it is heard; so that if the treble shall exhibit a dissonance, that must be syncopated; but if the dissonance is in the bass, the bass must be syncopated. Though there is nothing here but what is quite simple, yet have masters of music miserably embroiled the whole matter.

Some dissonances may be found which are never prepared: such is the sixth superadded: some which are very unfrequently prepared; such is the diminished seventh.

PREPARATIONS, in pharmacy, the medicines when mixed together in such a manner as to be fit for the use of the patient. See PHARMACY, Part II.

PREPARATIONS, in anatomy, the parts of animal bodies prepared and preserved for anatomical uses.

The manner of preserving anatomical preparations, is either by drying them thoroughly in the air, or putting them into a proper liquor.

In drying parts which are thick, when the weather is warm, care must be taken to prevent putrefaction, fly-blows, insects, &c. This is easily done by the use of a solution of corrosive sublimate in spirit of wine, in the proportion of two drams of sublimate to a pound of spirit: the part should be moistened with this liquor as it dries, and by this method the body of a child may be kept safe even in summer. Dried preparations are apt to crack and moulder away in keeping; to prevent this, their surface should be covered with a thick varnish, repeated as often as occasion requires.

Though several parts prepared dry are useful, yet others must be so managed as to be always flexible, and nearer a natural state. The difficulty has been to find a proper liquor for this purpose. Dr Monro says, the best he knows is a well rectified colourless spirit of wine, to which is added a small quantity of the spirit of vitriol or nitre. When these are properly mixed, they neither change their colour nor the consistence of the parts, except where there are serous or mucous liquors contained in them. The brain, even of a young child, in this mixture grows so firm as to admit of gentle handling, as do also the vitreous and crystalline humours of the eye. The liquor of the sebaceous glands and the semen are coagulated by this spirituous mixture; and it heightens the red colour of the injection of the blood-vessels, so that after the part has been in it a little time, several vessels appear which were before invisible. If you will compare these effects with what Ruych has said of his balsam, you will find the liquor abovementioned to come very near to it.

The proportion of the two spirits must be changed according to the part prepared. For the brain and humours of the eye, you must put two drams of spirit of nitre to one pound of spirit of wine. In preserving other parts which are harder, 30 or 40 drops of the acid will be sufficient; a larger quantity will make bones flexible, and even dissolve them. The part thus preserved should be always kept covered with the liquor: therefore great care should be taken to stop the mouth of the glass with a waxed cork and a bladder tied over it, to prevent the evaporation of the spirit; some of which, notwithstanding all this care, will fly off; therefore fresh must be added as there is occasion. When the spirits change to a dark tincture, which will sometimes happen, they should be poured off, and fresh put in their room; but with somewhat less acid than at first.

The glasses which contain the preparations should be of the finest sort, and pretty thick; for through such the parts may be seen very distinctly, and of a true colour, and the object will be so magnified as to

Prepara-
tion.Edin. Med.

tive.

show vessels in the glass which out of it were not to be seen.

As the glass, when filled with the liquor has a certain focus, it is necessary to keep the preparation at a proper distance from the sides of it, which is easily done by little sticks suitably placed, or by suspending it by a thread in a proper situation. The operator should be cautious of putting his fingers in this liquor oftener than is absolutely necessary; because it brings on a numbness on the skin, which makes the fingers unfit for any nice operation. The best remedy for this is to wash them in water mixed with a few drops of oil of tartar per deliquium.

Dr Christ. Jac. Trew prefers the rectified spirit of grain for preserving anatomical preparations to spirit of wine, or to compositions of alcohol, amber, camphor, &c. because these soon change into a brown colour, whereas the spirit from malt preserves its limpid appearance. When any part is to be preserved wet, wash it with water till it is no more tintured. The water is next to be washed away with spirits, and then the preparation is to be put among spirits in a glass, the mouth of which is to be closely covered with a glass head, over which a wet bladder and leaf-tin are to be tied. *Com. Lit. Norimb.* 1731, *semest.* 1. *specim.* 9. See also *Pole's Anatomical Instructor*, and *American Transactions*, vol. ii. p. 366.

PREPENSED, in law, denotes fore-thought. In which sense we say *prepenſed malice*, &c. If, when a man is slain upon a sudden quarrel, there were malice prepenſed formerly between them, it makes it murder; and, as it is called in some statutes, *prepenſed murder*.

PREPOSITION, in grammar, one of the parts of speech, being an indeclinable particle which yet serves to govern the nouns that follow it; such as *per*, *pro*, *propter*; and through, for, with, &c.

F. Buffier allows it to be only a modificative of a part of speech, serving to circumſtantiate a noun.

PREPUCE, in anatomy, the foreskin; being a prolongation of the cutis of the penis, covering the glans. See ANATOMY, n^o 107.

PREROGATIVE, in English law, an exclusive or peculiar privilege.

Royal PREROGATIVE, that special pre-eminence which the king hath over and above all other persons, and out of the ordinary course of the common law, in right of his regal dignity. It signifies in its etymology (from *præ* and *rogō*) something that is required or demanded before, or in preference to, all others. And hence it follows, that it must be in its nature singular and eccentric; that it can only be applied to those rights and capacities which the king enjoys alone in contradistinction to others, and not to those which he enjoys in common with any of his subjects: for if once any one prerogative of the crown could be held in common with the subject, it would cease to be prerogative any longer. And therefore Finch lays it down as a maxim, that the prerogative is that law in case of the king, which is law in no case of the subject.

Prerogatives are either *direct* or *incidental*. The *direct* are such positive substantial parts of the royal character and authority, as are rooted in, and spring from, the king's political person, considered merely by itself, without reference to any other extrinsic cir-

cumstance; as, the right of sending ambassadors, of creating peers, and of making war or peace. But such prerogatives as are *incidental* bear always a relation to something else, distinct from the king's person; and are indeed only exceptions, in favour of the crown, to those general rules that are established for the rest of the community: such as, that no costs shall be recovered against the king; that the king can never be a joint tenant; and that his debt shall be preferred before a debt to any of his subjects.

These substantive or direct prerogatives may again be divided into three kinds: being such as regard, first, the king's royal *character* or *dignity*; secondly, his royal *authority* or *power*; and, lastly, his royal *income*. These are necessary, to secure reverence to his person, obedience to his commands, and an affluent supply for the ordinary expences of government; without all of which it is impossible to maintain the executive power in due independence and vigour. Yet, in every branch of that large and extensive dominion, the constitution has interposed such seasonable checks and restrictions, as may curb it from trampling on those liberties which it was meant to secure and establish. The enormous weight of prerogative, if left to itself, (as in arbitrary governments it is), spreads havoc and destruction among all the inferior movements: but, when balanced and bridled by its proper counterpoise, timely and judiciously applied, its operations are then equable and regular; it invigorates the whole machine, and enables every part to answer the end of its construction.

I. Of the royal *dignity*. Under every monarchical establishment, it is necessary to distinguish the prince from his subjects, not only by the outward pomp and decorations of majesty, but also by ascribing to him certain qualities as inherent in his royal capacity, distinct from, and superior to, those of any other individual in the nation. For though a philosophical mind will (says Sir William Blackstone) consider the royal person merely as one man appointed by mutual consent to preside over many others, and will pay him that reverence and duty which the principles of society demand; yet the mass of mankind will be apt to grow insolent and refractory, if taught to consider their prince as a man of no greater perfection than themselves. The law therefore ascribes to the king, in his high political character, not only large powers and emoluments, which form his prerogative and revenue, but likewise certain attributes of a great and transcendent nature; by which the people are led to consider him in the light of a superior being, and to pay him that awful respect which may enable him with greater ease to carry on the business of government. This is what we understand by the royal dignity; the several branches of which we shall now proceed to enumerate.

1. And, first, the law ascribes to the king the attribute of *sovereignty*, or pre-eminency. See SOVEREIGNTY.

2. "The law also (according to Sir William Blackstone) ascribes to the king, in his political capacity, absolute *perfection*. 'The king can do no wrong.' Which ancient and fundamental maxim (says he) is not to be understood as if every thing transacted by the government was of course just and lawful; but means only two things. First, that whatever

Preroga-
tive.

Prerogative.

is exceptionable in the conduct of public affairs, is not to be imputed to the king, nor is he answerable for it personally to his people: for this doctrine would totally destroy that constitutional independence of the crown, which is necessary for the balance of power, in our free and active, and therefore compounded, constitution. And, secondly it means that the prerogative of the crown extends not to do any injury; it is created for the benefit of the people, and therefore cannot be exerted to their prejudice.—“The king, moreover, (he observes), is not only incapable of *doing* wrong, but even of *thinking* wrong: he can never mean to do an improper thing: in him is no folly or weakness. And, therefore, if the crown should be induced to grant any franchise or privilege to a subject contrary to reason, or in anywise prejudicial to the commonwealth or a private person, the law will not suppose the king to have meant either an unwise or an injurious action, but declares that the king was deceived in his grant; and thereupon such grant is rendered void, merely upon the foundation of fraud and deception, either by or upon those agents whom the crown has thought proper to employ. For the law will not cast an imputation on that magistrate whom it entrusts with the executive power, as if he was capable of intentionally disregarding his trust: but attributes to mere imposition (to which the most perfect of sublunary beings must still continue liable) those little inadvertencies, which, if charged on the will of the prince, might lessen him in the eyes of his subjects.”

But this doctrine has been exposed as ridiculous and absurd, by Lord Abingdon, in his *Dedication to the collective Body of the People of England*. “Let us see (says he) how these maxims and their comments agree with the constitution, with nature, with reason, with common sense, with experience, with fact, with precedent, and with Sir William Blackstone himself; and whether, by the application of these rules of evidence thereto, it will not be found, that (from the want of attention to that important line of distinction which the constitution has drawn between the *king* of England and the *crown* of England) what was attributed to the *monarchy* has not been given to the *monarch*, what meant for the *kingship* conveyed to the *king*, what designed for the *thing* transferred to the *person*, what intended for *theory* applied to *practice*; and so in consequence, that whilst the premises (of the perfection of the monarchy) be true, the conclusion (that the king can do no wrong) be not false.

“And, first, in reference to the constitution: to which if this matter be applied (meaning what it expresses, and if it do not it is unworthy of notice), it is subversive of a principle in the constitution, upon which the preservation of the constitution depends; I mean the principle of *resistance*; a principle which, whilst no man will now venture to gainsay, Sir William Blackstone himself admits, ‘*is justifiable to the person of the prince*, when the being of the state is endangered, and the public voice proclaims such resistance necessary;’ and thus, by such admission, both disproves the maxim, and oversets his own comment thereupon: for to say that ‘the king can do no wrong,’ and that ‘he is incapable even of thinking wrong,’ and then to admit that ‘resistance to his person is justifiable,’ are such

VOL. XV.

jarring contradictions in themselves, that, until reconciled, the necessity of argument is suspended.

“With respect then, in the next place, to the agreement of this maxim, and its comment, with nature, with reason, and with common sense, I should have thought myself sufficiently justified in appealing to every man’s own reflection for decision, if I had not been made to understand that nature, reason, and common sense, had had nothing to do with either. Sir William Blackstone says, ‘That though a philosophical mind will consider the royal person merely as one man appointed by mutual consent to preside over others, and will pay him that reverence and duty which the principles of society demand; yet the mass of mankind will be apt to grow insolent and refractory if taught to consider their prince as a man of no greater perfection than themselves; and therefore the law ascribes to the king, in his high political character, certain attributes of a great and transcendent nature, by which the people are led to consider him in the light of a superior being, and to pay him that awful respect which may enable him with greater ease to carry on the business of government. So that, in order to govern with greater ease (which by the bye is mere assertion without any proof), it is necessary to deceive the mass of mankind, by making them believe, not only what a philosophical mind cannot believe; but what it is impossible for any mind to believe; and therefore, in the investigation of this subject, according to Sir William, neither nature, reason, nor common sense, can have any concern.’—

“It remains to examine in how much this maxim and its comment agree with experience, with fact, with precedent, and with Sir William Blackstone himself. And here it is matter of most curious speculation, to observe a maxim laid down, and which is intended for a rule of government, not only without a single case in support of it, but with a string of cases, that may be carried back to Egbert the first monarch of England, in direct opposition to the doctrine. Who is the man, that, reading the past history of this country, will show us any king that has done no wrong? Who is the reader that will not find, that all the wrong and injuries which the free constitution of this country has hitherto suffered, have been solely derived from the arbitrary measures of our kings? And yet the mass of mankind are to look upon the king as a superior being; and the maxim, that ‘the king can do no wrong,’ is to remain as an article of belief. But, without pushing this inquiry any farther, let us see what encouragement Sir William Blackstone himself has given us for our credulity. After stating the maxim, and presenting us with a most lively picture, ‘of our sovereign lord thus *all perfect and immortal*,’ what does he make this all-perfection and immortality in the end to come to? His words are these: ‘For when king Charles’s deluded brother attempted to *enslave* the nation,’ (*no wrong this, to be sure*), ‘he found it was beyond his power: the people both *could*, and *did*, resist him; and in consequence of such resistance, obliged him to quit his enterprise and his throne together *.”

The sum of all is this: That the crown of England and the king of England are distinguishable, and not synonymous terms: that allegiance is due to the *crown*, and through the crown to the *king*: that the attributes

*Comment
vol. iv.
p. 433

Prerogative.

of the crown are sovereignty, perfection, and perpetuity; but that it does not therefore follow that the king can do no wrong. It is indeed to be admitted, that in high respect for the crown, high respect is also due to the wearer of that crown; that is, to the king: but the crown is to be preferred to the king, for the first veneration is due to the constitution. It is likewise *to be supposed* that the king *will* do no wrong: and as, to prevent this, a privy council is appointed by the constitution to assist the king in the execution of the government; so if any wrong be done, 'these men,' as Montesquieu expresses it, 'may be examined and punished (A).'

"But if any future king shall think to screen these evil counsellors from the just vengeance of the people, by becoming *his own minister*; and, in so doing shall take for his sanction *the attribute of perfection*, shall trust to the deception of his being *a superior being*, and cloak himself under the maxim that *the king can do no wrong*; I say, in such a case, let the appeal already made to the constitution, to nature, to reason, to common sense, to experience, to fact, to precedent, and to Sir William Blackstone himself, suffice; and preclude the necessity of any further remarks from me (B)."

To proceed now to other particulars: The law determines, that in the king can be no negligence, or LACHES; and therefore no delay will bar his right. *Nullum tempus occurrit regi*, is the standing maxim upon all occasions; for the law intends that the king is always busied for the public good, and therefore has not leisure to assert his right within the times limited to subjects. In the king also can be no stain or corruption of blood: for if the heir to the crown were attainted of treason or felony, and afterwards the crown should descend to him, this would purge the attainer *ipso facto*. And therefore, when Henry VII. who as earl of Richmond stood attainted, came to the crown, it was not thought necessary to pass an act of parliament to reverse this attainder; because, as Lord Bacon in his history of that prince informs us, it was agreed that the assumption of the crown had at once purged all attainders. Neither can the king, in judgment of law, as king, ever be a minor or under age; and therefore his royal grants and assents to acts of parliament are good, though he has not in his natural capacity attained the legal age of 21. By a statute, indeed, 28

Blackst. Comment.

Hen. VIII. c. 17. power was given to future kings to rescind and revoke all acts of parliament that should be made while they were under the age of 24: but this was repealed by the statute 1 Edward VI. c. 11. so far as related to that prince, and both statutes are declared to be determined by 24 Geo. II. c. 24. It hath also been usually thought prudent, when the heir-apparent has been very young, to appoint a protector, guardian, or regent, for a limited time: but the very necessity of such extraordinary provision is sufficient to demonstrate the truth of that maxim of common law, that in the king is no minority; and therefore he hath no legal guardian. See REGENT.

3. A third attribute of the king's majesty is his *perpetuity*. The law ascribes to him, in his political capacity, an absolute immortality. The king never dies. Henry, Edward, or George, may die; but the king survives them all. For, immediately upon the decease of the reigning prince in his natural capacity, his kingship or imperial dignity, by act of law, without any *interregnum* or interval, is vested at once in his heir; who is *eo instanti*, king to all intents and purposes. And so tender is the law of supposing even a possibility of his death, that his natural dissolution is generally called his *demise*; *dimissio regis vel coronæ*: an expression which signifies merely a transfer of property; for, as is observed in Plowden, when we say the demise of the crown, we mean only, that, in consequence of the disunion of the king's body-natural from his body-politic, the kingdom is transferred or demised to his successor, and so the royal dignity remains perpetual. Thus, too, when Edward the fourth, in the tenth year of his reign, was driven from his throne for a few months by the house of Lancaster, this temporary transfer of his dignity was denominated his *demise*; and all process was held to be discontinued, as upon a natural death of the king.

II. We are next to consider those branches of the royal prerogative which invest this our sovereign lord with a number of *authorities* and *powers*; in the exertion whereof consists the executive part of government. This is wisely placed in a single hand by the British constitution, for the sake of unanimity, strength, and dispatch. Were it placed in many hands, it would be subject to many wills; if disunited and drawing different ways, create weakness in a government; and to unite those several wills, and reduce them to one, is a work of more

Prerogative.

(A) Except the parliament, which is the great council of the nation, the judges, and the peers, who, being the hereditary counsellors of the crown, have not only a right, but are bound *in foro conscientie* to advise the king for the public good, the constitution knows of no other counsel than the privy council. Any other counsel, like Clifford, Arlington, Buckingham, Athley, Lauderdale, and, as the initial letters of these names express, is a CABAL, and as such should be suppressed. Nat. Bacon, speaking of the loss of power in the grand council of lords, says "The sense of state once contracted into a privy-council, is soon recontracted into a cabinet council, and last of all into a *favourite* or two; which many times brings damage to the public, and both *themselves* and *kings* into extreme *precipices*; partly for want of maturity, but principally through the providence of God over-ruling irregular courses to the hurt of such as walk in them." *Pol. Disc.* part. 2. p. 201.

(B) For experience, fact, and precedent, see the reigns of king John, Henry III. Edward II. Richard II. Charles I. and James II. See also *Mirror of Justices*; where it is said, "that this grand assembly (meaning the now parliament, or then Wittenagemotte) is to consider the government of God's people, how they may be kept from sin, live in quiet, and have right done them, according to the customs and laws; and more especially of *wrong done by the king*, queen, or their children:" to which Nat. Bacon adds this note: "At this time *the king might do wrong*, &c. and so say Bracton and Fleta of the *kings* in their time." *Disc.* part 1. p. 37. Lond. 1739.

Prerogative.

more time and delay than the exigencies of state will afford. The king of England is therefore not only the chief, but properly the sole, magistrate of the nation; all others acting by commission from, and in due subordination to, him: in like manner as, upon the great revolution in the Roman state, all the powers of the ancient magistracy of the commonwealth were concentrated in the new emperor; so that, as Gravina expresses it, *in ejus unius persona veteris rei publicæ vis atque majestas per cumulatas magistratum potestates exprimebatur*.

In the exertion of lawful prerogative the king is held to be absolute; that is, so far absolute, that there is no legal authority that can either delay or resist him. He may reject what bills, may make what treaties, may coin what money, may create what peers, may pardon what offences, he pleases: unless where the constitution hath expressly, or by evident consequence, laid down some exception or boundary; declaring, that thus far the prerogative shall go and no farther. For otherwise the power of the crown would indeed be but a name and a shadow, insufficient for the ends of government, if, where its jurisdiction is clearly established and allowed, any man or body of men were permitted to disobey it, in the ordinary course of law: we do not now speak of those extraordinary recourses to the first principles, which are necessary when the contracts of society are in danger of dissolution, and the law proves too weak a defence against the violence of fraud or oppression. And yet the want of attending to this obvious distinction has occasioned these doctrines, of absolute power in the prince and of national resistance by the people, to be much misunderstood and perverted, by the advocates for slavery on the one hand, and the demagogues of faction on the other. The former, observing the absolute sovereignty and transcendent dominion of the crown laid down (as it certainly is) most strongly and emphatically in our law-books as well as our homilies, have denied that any case can be excepted from so general and positive a rule; forgetting how impossible it is, in any practical system of laws, to point out beforehand those eccentric remedies, which the sudden emergence of national distress may dictate, and which that alone can justify. On the other hand, over-zealous republicans, feeling the absurdity of unlimited passive obedience, have fancifully (or sometimes factiously) gone over to the other extreme: and, because resistance is justifiable to the person of the prince when the being of the state is endangered, and the public voice proclaims such resistance necessary, they have therefore allowed to every individual the right of determining this expedience, and of employing private force to resist even private oppression. A doctrine productive of anarchy, and (in consequence) equally fatal to civil liberty as tyranny itself. For civil liberty, rightly understood, consists in protecting the rights of individuals by the united force of society: society cannot be maintained, and of course can exert no protection, without obedience to some sovereign power; and obedience is an empty name, if every individual has a right to decide how far he himself shall obey.

In the exertion, therefore, of those prerogatives which the law has given him, the king is irresistible and absolute, according to the forms of the constitution. And yet, if the consequence of that exertion be manifestly to the grievance or dishonour of the kingdom, the parliament will call his advisers to a just and severe account.

Blackst.
Comment.

Prerogative.

For prerogative consisting (as Mr Locke has well defined it) in the discretionary power of acting for the public good where the positive laws are silent, if that discretionary power be abused to the public detriment, such prerogative is exerted in an unconstitutional manner. Thus the king may make a treaty with a foreign state, which shall irrevocably bind the nation; and yet, when such treaties have been judged pernicious, impeachments have pursued those ministers by whose agency or advice they were concluded.

The prerogatives of the crown (in the sense under which we are now considering them) respect either the nation's intercourse with foreign nations, or its own domestic government and civil polity.

With regard to *foreign concerns*, the king is the delegate or representative of his people. It is impossible that the individuals of a state, in their collective capacity, can transact the affairs of that state with another community equally numerous as themselves. Unanimity must be wanting to their measures, and strength to the execution of their counsels. In the king therefore, as in a centre, all the rays of his people are united, and form by that union a consistency, splendor, and power, that make him feared and respected by foreign potentates; who would scruple to enter into any engagement, that must afterwards be revised and ratified by a popular assembly. What is done by the royal authority, with regard to foreign powers, is the act of the whole nation: what is done without the king's concurrence, is the act only of private men. And so far is this point carried by our law, that it hath been held, that should all the subjects of England make war with a king in league with the king of England, without the royal assent, such war is no breach of the league. And, by the statute 2 Hen. V. c. 6. any subject committing acts of hostility upon any nation in league with the king, was declared to be guilty of high treason: and, though that act was repealed by the statute 20 Hen. VI. c. 11. so far as relates to the making this offence high treason, yet still it remains a very great offence against the law of nations, and punishable by our laws, either capitally or otherwise, according to the circumstances of the case.

1. The king therefore, considered as the representative of his people, has the sole power of sending ambassadors to foreign states, and receiving ambassadors at home.

2. It is also the king's prerogative to make treaties, leagues, and alliances, with foreign states and princes. For it is, by the law of nations, essential to the goodness of a league, that it be made by the sovereign power; and then it is binding upon the whole community: and in Britain the sovereign power, *quoad hoc*, is vested in the person of the king. Whatever contracts therefore he engages in, no other power in the kingdom can legally delay, resist, or annul. And yet, lest this plenitude of authority should be abused to the detriment of the public, the constitution (as was hinted before) hath here interposed a check, by the means of parliamentary impeachment, for the punishment of such ministers as from criminal motives advise or conclude any treaty, which shall afterwards be judged to derogate from the honour and interest of the nation.

3. Upon the same principle the king has also the sole prerogative of making war and peace. For it is

Prerogative. held by all the writers on the law of nature and nations, in due form to all that feel themselves grieved. See Prerogative. MARQUE.

that the right of making war, which by nature subsisted in every individual, is given up by all private persons that enter into society, and is vested in the sovereign power: and this right is given up, not only by individuals, but even by the entire body of people that are under the dominion of a sovereign. It would indeed be extremely improper; that any number of subjects should have the power of binding the supreme magistrate, and putting him against his will in a state of war. Whatever hostilities, therefore, may be committed by private citizens, the state ought not to be affected thereby; unless that should justify their proceedings, and thereby become partner in their guilt. And the reason which is given by Grotius, why, according to the law of nations, a denunciation of war ought always to precede the actual commencement of hostilities, is not so much that the enemy may be put upon his guard (which is matter rather of magnanimity than right), but that it may be certainly clear that the war is not undertaken by private persons, but by the will of the whole community; whose right of willing is in this case transferred to the supreme magistrate by the fundamental laws of society. So that, in order to make a war completely effectual, it is necessary in Britain, that it be publicly declared and duly proclaimed by the king's authority; and then, all parts of both the contending nations, from the highest to the lowest, are bound by it. And wherever the right resides of beginning a national war, there also must reside the right of ending it, or the power of making peace. And the same check of parliamentary impeachment, for improper or inglorious conduct, in beginning, conducting, or concluding a national war, is in general sufficient to restrain the ministers of the crown from a wanton or injurious exertion of this great prerogative.

4. But, as the delay of making war may sometimes be detrimental to individuals who have suffered by depredations from foreign potentates, our laws have in some respects armed the subject with powers to impel the prerogative; by directing the ministers of the crown to issue letters of marque and reprisal upon due demand: the prerogative of granting which is nearly related to, and plainly derived from, that other of making war; this being indeed only an incomplete state of hostilities, and generally ending in a formal denunciation of war. These letters are grantable, by the law of nations, whenever the subjects of one state are oppressed and injured by those of another, and justice is denied by that state to which the oppressor belongs. In this case, letters of marque and reprisal (words in themselves synonymous, and signifying a taking in return) may be obtained, in order to seize the bodies or goods of the subjects of the offending state, until satisfaction be made, wherever they happen to be found. And indeed this custom of reprisals seems dictated by nature herself; for which reason we find in the most ancient times very notable instances of it. But here the necessity is obvious of calling in the sovereign power, to determine when reprisals may be made; else every private sufferer would be a judge in his own cause. In pursuance of which principle, it is declared by the statute 4 Hen. V. c. 7. that if any subjects of the realm are oppressed in time of truce by any foreigners, the king will grant marque

5. Upon exactly the same reason stands the prerogative of granting safe-conducts; without which, by the law of nations, no member of one society has a right to intrude into another. And therefore Puffendorff very justly resolves, that it is left in the power of all states to take such measures about the admission of strangers as they think convenient; those being ever excepted who are driven on the coasts by necessity, or by any cause that deserves pity or compassion. Great tenderness is shown by the laws, not only to foreigners in distress, (see WRECK), but with regard also to the admission of strangers who come spontaneously: for so long as their nation continues at peace with ours, and they themselves behave peaceably, they are under the king's protection; though liable to be sent home whenever the king sees occasion. But no subject of a nation at war with us can, by the law of nations, come into the realm, nor can travel himself upon the high seas, or send his goods and merchandize from one place to another, without danger of being seized by our subjects, unless he has letters of safe-conduct; which, by divers ancient statutes, must be granted under the king's great seal and inrolled in chancery, or else they are of no effect; the king being supposed the best judge of such emergencies, as may deserve exception from the general law of arms. But passports under the king's sign-manual, or licences from his ambassadors abroad, are now more usually obtained, and are allowed to be of equal validity.

These are the principal prerogatives of the king respecting this nation's intercourse with foreign nations; in all of which he is considered as the delegate or representative of his people. But in domestic affairs, he is considered in a great variety of characters, and from thence there arises an abundant number of other prerogatives.

1. He is a constituent part of the supreme legislative power; and, as such, has the prerogative of rejecting such provisions in parliament as he judges improper to be passed. The expediency of which constitution has before been evinced at large under the article PARLIAMENT. We shall only farther remark, that the king is not bound by any act of parliament, unless he be named therein by special and particular words. The most general words that can be devised (any person or persons, bodies politic, or corporate, &c.) affect not him in the least, if they may tend to restrain or diminish any of his rights or interests. For it would be of most mischievous consequence to the public, if the strength of the executive power were liable to be curtailed, without its own express consent, by constructions and implications of the subject. Yet, where an act of parliament is expressly made for the preservation of public rights and the suppression of public wrongs, and does not interfere with the established rights of the crown, it is said to be binding as well upon the king as upon the subject: and, likewise, the king may take the benefit of any particular act, though he be not especially named.

2. The king is considered, in the next place, as the generalissimo, or the first in military command, within the kingdom. The great end of society is to protect the weakness of individuals by the united strength of the

Prerogative.

the community; and the principal use of government is to direct that united strength in the best and most effectual manner, to answer the end proposed. Monarchical government is supposed to be the fittest of any for this purpose: it follows therefore, from the very end of its institution, that in a monarchy the military power must be trusted in the hands of the prince.

In this capacity, therefore, of general of the kingdom, the king has the sole power of raising and regulating fleets and armies. The manner in which they are raised and regulated is explained under the article *MILITARY STATE*. We are now only to consider the prerogative of enlisting and of governing them: which indeed was disputed and claimed, contrary to all reason and precedent, by the long parliament of king Cha. I.; but, upon the restoration of his son, was solemnly declared by the statute 13 Charles II. c. 6. to be in the king alone: for that the sole supreme government and command of the militia within all his majesty's realms and dominions, and of all forces by sea and land, and of all forts and places of strength, ever was and is the undoubted right of his majesty, and his royal predecessors, kings and queens of England; and that both or either house of parliament cannot, nor ought to, pretend to the same.

This statute, it is obvious to observe, extends not only to fleets and armies, but also to forts and other places of strength within the realm; the sole prerogative, as well of erecting, as manning and governing of which, belongs to the king in his capacity of general of the kingdom: and all lands were formerly subject to a tax, for building of castles wherever the king thought proper. This was one of the three things, from contributing to the performance of which no lands were exempted, and therefore called by the Anglo-Saxons the *trinoda necessitas*; *sc. pontis reparatio, arcis constructio, et expeditio contra hostem*. And this they were called upon to do so often, that, as Sir Edward Coke from M. Paris assures us, there were in the time of Henry II. 1115 castles subsisting in England. The inconveniences of which, when granted out to private subjects, the lordly barons of those times, were severely felt by the whole kingdom; for, as William of Newburg remarks in the reign of king Stephen, *erant in Anglia quodammodo tot reges vel potius tyranni, quot domini castellorum*; but it was felt by none more sensibly than by two succeeding princes, king John and king Henry III. And therefore, the greatest part of them being demolished in the baron's wars, the kings of after times have been very cautious of suffering them to be rebuilt in a fortified manner: and Sir Edward Coke lays it down, that no subject can build a castle, or house of strength impbattled, or other fortress defensible, without the licence of the king; for the danger which might ensue, if every man at his pleasure might do it.

It is partly upon the same, and partly upon a fiscal foundation, to secure his marine revenue, that the king has the prerogative of appointing *ports* and *havens*, or such places only, for persons and merchandize to pass into and out of the realm, as he in his wisdom sees proper. By the feudal law, all navigable rivers and havens were computed among the regalia, and were subject to the sovereign of the state. And in England it hath always been held, that the king is lord of the whole shore, and particularly is the guardian of the ports and havens,

Prerogative.

which are the inlets and gates of the realm: and therefore, so early as the reign of king John, we find ships seized by the king's officers for putting in at a place that was not a legal port. These legal ports were undoubtedly at first assigned by the crown; since to each of them a court of portmote is incident, the jurisdiction of which must flow from the royal authority: the *great ports* of the sea are also referred to as well known and established, by statute 4 Hen. IV. c. 20. which prohibits the landing elsewhere under pain of confiscation; and the statute 1 Eliz. c. 11. recites, that the franchise of lading and discharging had been frequently granted by the crown.

But though the king had a power of granting the franchise of havens and ports, yet he had not the power of resumption, or of narrowing and confining their limits when once established; but any person had a right to load or discharge his merchandize in any part of the haven: whereby the revenue of the custom was much impaired and diminished, by fraudulent landings in obscure and private corners. This occasioned the statutes of Eliz. c. 11. and 13 and 14 Car. II. c. 11. § 14. which enable the crown by commission, to ascertain the limits of all ports, and to assign proper wharfs and quays in each port, for the exclusive landing and loading of merchandize.

The erection of beacons, light-houses, and sea-marks, is also a branch of the royal prerogative: whereof the first was anciently used in order to alarm the country, in case of the approach of an enemy; and all of them are signally useful in guiding and preserving vessels at sea by night as well as by day. See *BEACON*.

3. Another capacity in which the king is considered in domestic affairs, is as the fountain of justice and general conservator of the peace of the kingdom. See the article *Fountain of Justice*.

4. The king is likewise the fountain of honour, of office, and of privilege: and this in a different sense from that wherein he is styled the *fountain of justice*; for here he is really the parent of them. See the articles *Fountain of Justice* and *Fountain of Honour*.

5. Another light, in which the laws of England consider the king with regard to domestic concerns, is as the arbiter of commerce. By commerce, we at present mean domestic commerce only; for the king's prerogative with regard to which see *Regulation of Weights and Measures, MONEY, &c.*

6. The king is, lastly, considered by the laws of England as the head and supreme governor of the national church.

To enter into the reasons upon which this prerogative is founded is matter rather of divinity than of law. We shall therefore only observe, that by statute 26 Hen. VIII. c. 1. (reciting that the king's majesty justly and rightfully is and ought to be the supreme head of the church of England; and so had been recognized by the clergy of that kingdom in their convocation) it is enacted, that the king shall be reputed the only supreme head in earth of the church of England; and shall have, annexed to the imperial crown of this realm, as well the title and style thereof, as all jurisdictions, authorities, and commodities, to the said dignity of supreme head of the church appertaining. And another statute to the same purport was made, 1 Eliz. c. 1.

In virtue of this authority the king convenes, pro-

rogues,

Prerogative
||
Presburg.

rogues, restrains, regulates, and dissolves, all ecclesiastical synods or convocations. This was an inherent prerogative of the crown long before the time of Henry VIII. as appears by the statute 8 Hen. VI. c. 1. and the many authors, both lawyers and historians, vouched by Sir Edward Coke. So that the statute 25 Hen. VIII. c. 19. which restrains the convocation from making or putting in execution any canons repugnant to the king's prerogative, or the laws, customs, and statutes of the realm, was merely declaratory of the old common law: that part of it only being new, which makes the king's royal assent actually necessary to the validity of every canon. The convocation or ecclesiastical synod, in England, differs considerably in its constitution from the synods of other Christian kingdoms: those consisting wholly of bishops; whereas in England the convocation is the miniature of a parliament, wherein the archbishop presides with regal state; the upper house of bishops represents the house of lords; and the lower house, composed of representatives of the several dioceses at large, and of each particular chapter therein, resembles the house of commons with its knights of the shire and burgesses. This constitution is said to be owing to the policy of Edward I. who thereby at one and the same time let in the inferior clergy to the privileges of forming ecclesiastical canons (which before they had not), and also introduced a method of taxing ecclesiastical benefices, by consent of convocation.

From this prerogative also, of being the head of the church, arises the king's right of nomination to vacant bishoprics, and certain other ecclesiastical preferments.

As head of the church, the king is likewise the *dernier resort* in all ecclesiastical causes; an appeal lying ultimately to him in chancery from the sentence of every ecclesiastical judge: which right was restored to the crown by statute 25 Hen. VIII. c. 9.

III. The king's fiscal prerogatives, or such as regard his revenue. See the article *REVENUE*.

PREROGATIVE-COURT, an English court established for the trial of all testamentary causes, where the deceased hath left *bona notabilia* within two different dioceses. In which case the probate of wills belongs to the archbishop of the province, by way of special prerogative. And all causes relating to the wills, administrations, or legacies of such persons, are originally cognizable herein, before a judge appointed by the archbishop, called the *judge of the prerogative-court*; from whom an appeal lies by statute 25 Hen. VIII. c. 19. to the king in chancery, instead of the pope as formerly.

PRESAGE, in antiquity, denotes an augury, or sign of some future event; which was chiefly taken from the flight of birds, the entrails of victims, &c. See *AUGURY* and *ARUSPICES*.

PRESBURG, the capital of the kingdom of Lower Hungary, called by the inhabitants *Pofony* and *Presporen*, situated on the Danube, about 46 miles east from Vienna, and 75 from Buda. The castle, in which the regalia are kept, stands on a hill above the town. Here the states assemble; and in the cathedral, dedicated to St Martin, the king is crowned. The town is not very large, nor well built; but is very ancient, pleasantly situated, and enjoys a good air. Its fortifications are only a double wall and ditch. In the lower suburbs is a hill, where the king, after his coronation, goes on horseback, and brandishes St. Stephen's sword towards the four car-

dinal points, intimating, that he will defend his country against all its enemies. Besides the cathedral, there are several other Popish and one Lutheran church, with a Jesuits college, three convents, and two hospitals. It gives name to a country; and is the residence of the archbishop of Gran, who is primate, chief secretary, and chancellor of the kingdom, *legatus natus* of the Papal see, and prince of the holy Roman empire. E. Long. 17. 30. N. Lat. 48. 20.

PRESBYTÆ, persons whose eyes are too flat to refract the rays sufficiently, so that unless the object is at some distance, the rays coming from it will pass through the retina before their union, consequently vision is confused; old people are usually the subjects of this disease. In order to remedy, or at least to palliate, this defect, the person should first use glasses which do not magnify, and from them pass gradually to more convex spectacles, which shorten the focus.

PRESBYTER, in the primitive Christian church, an elder, one of the second order of ecclesiastics; the other two being bishops and deacons. See the articles *BISHOP* and *DEACON*.

Presbyter or elder is a word borrowed from the Greek translation of the Old Testament, where it commonly signifies ruler or governor; it being a note of office and dignity, not of age; and in this sense bishops are sometimes called *presbyters* in the New Testament. The presbyters might baptize, preach, consecrate, and administer the eucharist in the bishop's absence, or in his presence if he authorized and deputed them; and the bishops did scarce any thing in the government of the church without their advice, consent, and amicable concurrence.

The grand dispute between the followers of the Geneva and Roman discipline, is about the sameness and difference of presbyters and bishops at the time of the apostles. See *EPISCOPACY*, *INDEPENDENTS*, and the following article.

PRESBYTERIANS, Protestants, so called from their maintaining that the government of the church appointed in the New Testament was by presbyteries, that is, by associations of ministers and ruling elders, possessed all of equal powers, without any superiority among them either in office or in order.

The Presbyterians believe, that the authority of their ministers to preach the gospel, to administer the sacraments of baptism and the Lord's supper, and to feed the flock of Christ, is derived from the Holy Ghost by the imposition of the hands of the presbytery; and they oppose the independent scheme of the common rights of Christians by the same arguments which are used for that purpose by the Episcopalians (see *EPISCOPACY*). They affirm, however, that there is no order in the church as established by Christ and his apostles superior to that of presbyters; that all ministers being ambassadors of Christ, are equal by their commission; that *presbyter* and *bishop*, though different words, are of the same import; and that prelacy was gradually established upon the primitive practice of making the *moderator* or speaker of the presbytery a permanent officer.

These positions they maintain against the Episcopalians by the following scriptural arguments. They observe, that the apostles planted churches by ordaining bishops and deacons in every city; that the ministers which in one verse are called bishops are in the next perhaps

Discriminating principle of the Presbyterians.

Scriptural arguments against episcopacy.

Presbyterians.

perhaps denominated presbyters; that we nowhere read in the New Testament of bishops, presbyters, and deacons, in any one church; and that therefore we are under the necessity of concluding *bishop* and *presbyter* to be two names for the same church officer. This is apparent from Peter's exhortation to the *elders* or *presbyters* who were among the Jewish Christians. "The *elders* (presbyters) which are among you I exhort, who am also an *elder*, and a witness of the sufferings of Christ, and also a partaker of the glory that shall be revealed: Feed the flock of God which is among you, taking the oversight thereof (*ἐπισκοποῦντες* acting as *bishops* thereof), not by constraint, but willingly; not for filthy lucre, but of a ready mind; neither as being lords over God's heritage, but being enamples to the flock *." From this passage it is evident, that the presbyters not only fed the flock of God, but also governed that flock with episcopal powers; and that the apostle himself, as a church officer, was nothing more than a presbyter or elder. The identity of the office of bishop and presbyter is still more apparent from Heb. xiii. 7. 17. and 1 Thess. v. 12.; for the bishops are there represented as governing the flock, speaking to them the word of God, watching for their souls, and discharging various offices, which it is impossible for any man to perform to more than one congregation.

* 1 Peter v. 1, 2, 3.

3
Reasons for supposing bishops and presbyters of the same order.

† Chap. v. 14.

From the last cited text it is evident, that the bishops (*ἐπιστάται*) of the Thessalonian churches had the pastoral care of no more souls than they could hold personal communion with in God's worship; for they were such as all the people were to *know, esteem, and love*, as those that not only were *over them*, but also "closely laboured among them and admonished them." But diocesan bishops, whom ordinarily the hundredth part of their flock never hear nor see, cannot be those bishops by whom that flock is admonished, nor can they be what Peter requires the bishops of the Jewish converts to be, *enamples to the flock*. It is the opinion of Dr Hammond, who was a very learned divine, and a zealot for episcopacy, that the *elders* whom the apostle James desires † the sick to call for, were of the highest permanent order of ecclesiastical officers; but it is self-evident that those elders cannot have been diocesan bishops, otherwise the sick must have been often without the reach of the remedy proposed to them.

There is nothing in Scripture upon which the Episcopalian is more ready to rest his cause than the alleged episcopacy of Timothy and Titus; of whom the former is said to have been bishop of Ephesus, and the latter bishop of Crete; yet the Presbyterian thinks it as clear as the noon-day sun, that the presbyters of Ephesus were supreme governors under Christ of the Ephesian churches, at the very time that Timothy is pretended to have been their proper diocesan.

In Acts xx. 17, &c. we read, that "from Miletus Paul sent to Ephesus, and called the elders (presbyters) of the church. And when they were come to him, he said unto them, Ye know, from the first day that I came into Asia, after what manner I have been with you, at all seasons. And now I know that ye all, among whom I have gone preaching the kingdom of God, shall see my face no more. Wherefore I take you to record this day, that I am pure from the blood of all men. For I have not shunned to declare unto you all the counsel of God. Take heed therefore unto

yourself, and to all the flock over which the Holy Ghost hath made you overseers (*ἐπισκοπούς bishops*), to feed the church of God, which he hath purchased with his own blood. For I know this, that after my departure shall grievous wolves enter in among you, not sparing the flock. Also of your own selves shall men arise, speaking perverse things, to draw away disciples after them. Therefore watch, and remember, that by the space of three years, I ceased not to warn every one night and day with tears. And now, brethren, I commend you to God, and to the word of his grace," &c.

From this passage, it is evident that there was in the city of Ephesus a plurality of pastors of equal authority without any superior pastor or bishop over them; for the apostle directs his discourse to them all in common, and gives them equal power over the whole flock. Dr Hammond indeed imagines, that the elders whom Paul called to Miletus were the *bishops* of *Asia*, and that he sent for them to Ephesus, because that city was the metropolis of the province. But were this opinion well-founded, it is not conceivable that the sacred writer would have called them the elders of the church of *Ephesus*, but the elders of the *church in general*, or the elders of the *churches in Asia*. Besides, it is to be remembered, that the apostle was in such haste to be at Jerusalem, that the sacred historian measures his time by *days*; whereas it must have required several months to call together the bishops or elders of all the cities of Asia; and he might certainly have gone to meet them at Ephesus in less time than would be requisite for their meeting in that city and proceeding thence to him at Miletus. They must therefore have been either the joint pastors of one congregation, or the pastors of different congregations in one city: and as it was thus in Ephesus, so was it in Philippi; for we find the apostle addressing his epistle "to all the saints in Christ Jesus which are at Philippi, with the bishops and deacons." From the passage before us it is likewise plain, that the presbyters of Ephesus had not only the *name* but the whole *power* of bishops given to them by the Holy Ghost; for they are enjoined to do the whole work of bishops—*ποιμαίνειν τὴν ἐκκλησίαν τοῦ θεοῦ*—which signifies, to *rule* as well as *feed* the church of God. Whence we see, that the apostle makes the power of *governing* inseparable from that of *preaching* and *watching*; and that according to him, all who are preachers of God's word, and watchmen of souls, are necessarily rulers or governors of the church, without being accountable for their management to any prelate, but only to their Lord Christ from whom their power is derived.

It appears therefore, that the apostle Paul left in the church of Ephesus, which he had planted, no other successors to himself than *presbyter-bishops*, or Presbyterian ministers, and that he did not devolve his power upon any prelate. Timothy, whom the Episcopalian alleges to have been the first bishop of Ephesus, was present when this settlement was made*; and it is surely not to be supposed, that, had he been their bishop, the apostle would have devolved the whole episcopal power upon the presbyters before his face. If ever there was a season fitter than another for pointing out the duty of this supposed bishop to his diocese, and his presbyters duty to him, it was surely when Paul was taking his final leave of them, and discoursing so pathetically concerning

Presbyterians.

4
The pastors of Ephesus of equal authority.

5
Timothy no bishop.

* Acts xx.

Presbyterians.

cerning the duty of *overseers*, the coming of ravenous wolves, and the consequent hazard of the flock. In this farewell discourse, he tells them that "he had not shunned to declare unto them all the counsel of God." But with what truth could this have been said, if obedience to a diocesan bishop had been any part of their duty either at the time of the apostle's speaking or at any future period? He foresaw that ravenous wolves would enter in among them, and that even some of themselves should arise speaking perverse things; and if, as the Episcopalians allege, diocesan episcopacy was the remedy provided for those evils, is it not strange, passing strange, that the inspired preacher did not foresee that Timothy, who was standing beside him, was destined to fill that important office; or if he did foresee it, that he omitted to recommend him to his future charge, and to give him proper instructions for the discharge of his duty?

6
But an evangelist.

But if Timothy was not bishop of Ephesus, what, it may be asked, was his office in that city? for that he resided there for some time, and was by the apostle invested with authority to ordain and rebuke presbyters, are facts about which all parties are agreed, and which indeed cannot be controverted by any reader of Paul's epistles. To this the Presbyterian replies with confidence, that the power which Timothy exercised in the church of Ephesus was that of an evangelist †, and not a fixed prelate. But, according to Eusebius, the work of an evangelist was, "to lay the foundations of the faith in barbarous nations, and to constitute among them pastors; after which he passed on to other countries." Accordingly we find, that Timothy was resident for a time at Philippi and Corinth ‡ as well as at Ephesus, and that he had as much authority over those churches as over that of which he is said to have been the fixed bishop. "Now, if Timotheus come, see that he may be with you without fear, for he worketh the work of the Lord, as I also do. Let no man therefore despise him." This text might lead us to suppose, that Timothy was bishop of Corinth as well as of Ephesus; for it is stronger than that upon which his episcopacy of the latter church is chiefly built. The apostle says, "I besought thee * to abide still at Ephesus, when I went into Macedonia, that thou mightest charge some that they teach no other doctrine." But had Timothy been the fixed bishop of that city, there would surely have been no necessity for *beseeching* him to abide with his flock. It is to be observed, too, that the first epistle to Timothy, which alone was written to him during his residence at Ephesus, was of a date prior to Paul's meeting with the elders of that church at Miletus; for in the epistle he hopes to come to him shortly, whereas he tells the elders at Miletus that they should see his face no more. This being the case, it is evident that Timothy was left by the apostle at Ephesus only to supply his place during his temporary absence at Macedonia, and that he could not possibly have been constituted fixed bishop of that church, since the episcopal powers were afterwards committed to the presbyters by the Holy Ghost in his presence.

* 1 Tim. i. 3.

7
Presbyterate the highest permanent office in the church.

The identity of the office of bishop and presbyter being thus clearly established, it follows, that the presbyterate is the highest permanent office in the church, and that every faithful pastor of a flock is successor to the apostles in every thing in which they were to have

any successors. In the apostolic office there were indeed some things peculiar and extraordinary, such as their immediate call by Christ, their infallibility, their being witnesses of our Lord's resurrection, and their unlimited jurisdiction over the whole world. These powers and privileges could not be conveyed by imposition of hands to any successors, whether called presbyters or bishops; but as rulers or office-bearers in particular churches, we have the confession of "the very chiefest apostles," Peter and John, that they were nothing more than presbyters or parish ministers. This being the case, the dispute, which in the early part of the passing century was so warmly agitated concerning the validity of Presbyterian ordination, may be soon decided; for if the ceremony of ordination be at all essential, it is obvious that such a ceremony performed by presbyters must be valid, as there is no higher order of ecclesiastics in the church by whom it can be performed. Accordingly we find, that Timothy himself, though said to be a bishop, was ordained by the laying on of the hands of a presbytery. At that ordination indeed St. Paul presided, but he could preside only as *primus in paribus*; for we have seen that, as permanent officers in the church of Christ, the apostles themselves were no more than presbyters. If the apostles' hands were imposed for any other purpose, it must have been to communicate those *charismata* or miraculous gifts of the Holy Spirit, which were then so frequent; but which no modern presbyter or bishop will pretend to give, unless his understanding be clouded by the grossest ignorance, or perverted by the most frantic enthusiasm.

But if the office of bishop and presbyter was originally the same, how, it will be asked, came diocesan episcopacy to prevail so universally as it is confessed to have done before the conversion of Constantine and the civil establishment of Christianity in the Roman empire? To give a satisfactory answer to this question is certainly the most arduous task which the advocate for presbytery has to perform; but it is a task not insurmountable.

From many passages in the New Testament *, it is evident, that when the apostles planted churches in different cities, they generally settled more than one pastor in the same church, to feed and govern it with joint authority. The propriety of this constitution is obvious. In those days, when the disciples of Christ were persecuted for their religion, and often obliged to meet in the "night for fear of the Jews," they could not with any degree of prudence assemble in large numbers; and therefore, had there been no more than one pastor in a city, the Christian converts, though, when assembled, they might have amounted to but a small congregation, could not all have enjoyed the benefit of public worship on the same day; at least it is obvious that they could not possibly have assembled for this purpose so often as their want of instruction, and the duty of "breaking of bread and of prayer," required them to meet. It was therefore with great wisdom that the apostles ordained several presbyters in the same church; but as these presbyters would have occasion to meet frequently, and to deliberate on the state of the flock which it was their duty to feed, and over which they had all equal authority, they would be under the necessity of electing one of their own number

Presbyterians.

9
According to Jerome.

number to be president or *moderator* of the presbytery, that order might be preserved, and all things done with decency. At first there is reason to believe that those presidents held their office no longer than while the presbyteries sat in which they were elected. Among the apostles themselves there was no fixed president. Peter indeed appears to have been most frequently admitted to that honour; but there is one very memorable occasion on record †, when James the Lord's brother presided in an assembly of apostles, elders, and brethren, held at Jerusalem, to determine the question concerning the necessity of circumcising the Gentiles, and commanding them to keep the law of Moses.

Upon this model were the primitive presbyteries formed. They consisted of several presbyters possessed of equal powers, who at their meetings appointed one of their own number to discharge the office of moderator or temporary president; but to this president they gave no prelatical powers or negative voice over the deliberations of his brethren; for, as Jerome informs us, the church was then governed *communione presbyterorum concilio*, "by a common council of presbyters." It appears, however, that when an apostle, an apostolical man, or an evangelist, fixed his residence in any city, and took upon himself the pastoral care of part of the flock, his co-presbyters, from respect to his singular gifts, made him their constant and fixed moderator. Hence Timothy, during his abode at Ephesus, was moderator of the presbytery; and hence too Mark the evangelist, who resided many years in Alexandria, has been called the first bishop of that church, though he appears to have been nothing more than permanent moderator. We advance this upon the authority of Jerome, one of the most learned fathers of the Christian church, who informs us, that upon the death of the evangelist, the presbyters of Alexandria, for more than 200 years, chose their bishops from their own number, and placed them in the episcopal chair, without dreaming that they ought to be raised to a higher order by a new consecration;—*Presbyteri unum ex se electum in excellentiori gradu collocatum, episcopum nominabant*. As this practice of making the moderator of the presbytery of Alexandria a permanent officer, was thought a good expedient to guard the infant churches against schisms and divisions, those churches gradually adopted it. For, as Jerome tells us, *Postquam unusquisque eos quos baptizaverat, suos putabat esse, non Christi, in toto orbe decretum est, ut unus de presbyteris electus, superponeretur ceteris, ad quem omnis ecclesiæ cura pertineret, et schismatum semina tollerentur*.

The advantages which, in displaying his talents and authority, the perpetual president or speaker of any assembly has over his colleagues in office, are so obvious, that when the practice of electing their moderators for life became universal among the presbyteries of the primitive church, it is easy to conceive how ambitious men might so magnify the difficulties and importance of their station, as to introduce the custom of filling it by a new consecration of the bishop elect. But when this was done, diocesan episcopacy, with all its powers and prerogatives, would follow as a thing of course, until "by little and little (as Jerome expresses himself) the whole pastoral care of the flock was devolved upon one man."

Our limits will not permit us to trace more minutely
Vol. XV.

the rise and progress of this ecclesiastical usurpation, as the Presbyterian calls it; but the reader who wishes for fuller information, after studying the remains of the four first centuries of the Christian church, may consult *An Inquiry into the Constitution, Discipline, and Worship, of the Primitive Church*, said to have been written by Sir Peter King, afterwards lord chancellor of England. As an impartial lover of truth, he will do well to consult also a book intitled *An original Draught of the Primitive Church*, which was published as an answer to the Inquiry; and he may read with much advantage to himself *A Letter from a parochial bishop to a prelatial gentleman*, with *An Apology for the church of Scotland*, both written by Mr Willison some time minister in Dundee, and both evincing considerable learning and great ingenuity in their pious author.

Of the churches at present formed upon this model, we believe, that without hesitation, we may safely affirm the church of Scotland to be in general the most respectable. Her mode of worship is simple and solemn; her established faith agreeable to the confessions of most other Protestant churches; her judicatories are calculated to maintain the rights of the people; and her pastors are confessedly men of liberal and enlightened minds. On these accounts it appears to us, that we cannot more properly conclude this article than with a short view of her constitution, as being that in which our Presbyterian readers will find themselves most interested.

No one is ignorant, that from the first dawn of reformation in Scotland, till the era of the revolution, there was a perpetual struggle between the court and the people for the establishment of an Episcopal or a Presbyterian form of church government: The former model of ecclesiastical polity was patronised by the house of Stuart on account of the support which it gave to the prerogatives of the crown; the latter was the favourite of the majority of the people, perhaps not so much on account of its superior claim to apostolical institution, as because the laity are mixed with the clergy in church judicatories, and the two orders, which under episcopacy are kept so distinct, incorporated, as it were, into one body. In the Scottish church, every regulation of public worship, every act of discipline, and every ecclesiastical censure, which in other churches flows from the authority of a diocesan bishop, or from a convocation of the clergy, is the joint work of a certain number of clergymen and laymen acting together with equal authority, and deciding every question by a plurality of voices. The laymen who thus form an essential part of the ecclesiastical courts of Scotland, are called *ruling elders*; and hold the same office, as well as the same name, with those brethren * who joined with the apostles and elders at Jerusalem in determining the important question concerning the necessity of imposing upon the Gentile converts the ritual observances of the law of Moses. These lay-elders Paul enjoined Timothy † to account worthy of double honour, if they should rule well, and discharge the duties for which they were separated from the multitude of their brethren. In the church of Scotland every parish has two or three of those lay-elders, who are grave and serious persons chosen from among the heads of families, of known orthodoxy and steady adherence to the worship, discipline, and government of the church. vincial sy-
nod.

ing solemnly engaged to use their utmost endeavours for the suppression of vice and the cherishing of piety and virtue, and to exercise discipline faithfully and diligently, the minister, in the presence of the congregation, sets them apart to their office by solemn prayer; and concludes the ceremony, which is sometimes called ordination, with exhorting both elders and people to their respective duties.

The kirk-session, which is the lowest ecclesiastical judicatory, consists of the minister and those elders of the congregation. The minister is *ex officio* moderator, but has no negative voice over the decision of the session; nor indeed has he a right to vote at all, unless when the voices of the elders are equal and opposite. He may indeed enter his protest against their sentence, if he think it improper, and appeal to the judgment of the presbytery; but this privilege belongs equally to every elder, as well as to every person who may believe himself aggrieved by the proceedings of the session. The deacons, whose proper office it is to take care of the poor, may be present in every session, and offer their counsel on all questions that come before it; but except in what relates to the distribution of alms, they have no decisive vote with the minister and elders.

The next judicatory is the *presbytery*, which consists of all the pastors within a certain district, and one ruling elder from each parish commissioned by his brethren to represent, in conjunction with the minister, the session of that parish. The presbytery treats of such matters as concern the particular churches within its limits; as the examination, admission, ordination, and censuring of ministers; the licensing of probationers, rebuking of gross or contumacious sinners, the directing of the sentence of excommunication, the deciding upon references and appeals from kirk-sessions, resolving cases of conscience, explaining difficulties in doctrine or discipline; and censuring, according to the word of God, any heresy or erroneous doctrine which hath been either publicly or privately maintained within the bounds of its jurisdiction. Whatever advantages may arise from this equality, we cannot altogether approve of that part of the constitution which gives an equal vote, in questions of heresy, to an illiterate mechanic and his enlightened pastor. We are persuaded that it has been the source of much trouble to many a pious clergyman; who, from the laudable desire of explaining the scriptures and declaring to his flock all the counsel of God, has employed a variety of expressions of the same import, to illustrate those articles of faith, which may be obscurely expressed in the established standards. The fact however is, that, in presbyteries, the only prerogatives which the pastors have over the ruling elders, are the power of ordination by imposition of hands, and the privilege of having the moderator chosen from their body.

From the judgment of the presbytery there lies an appeal to the provincial synod, which ordinarily meets twice in the year, and exercises over the presbyteries within the province a jurisdiction similar to that which is vested in each presbytery over the several kirk-sessions within its bounds. Of these synods there are in the church of Scotland fifteen, which are composed of the members of the several presbyteries within the respective provinces which give names to the synods.

The highest authority in the church of Scotland is

the general assembly, which consists of a certain number of ministers and ruling elders delegated from each presbytery, and of commissioners from the universities and royal boroughs. A presbytery in which there are fewer than twelve parishes, sends to the general assembly two ministers and one ruling elder: if it contain between 12 and 18 ministers, it sends three of these, and one ruling elder: if it contain between 18 and 24 ministers, it sends four ministers and two ruling elders; and of 24 ministers, when it contains so many, it sends five with two ruling elders. Every royal borough sends one ruling elder, and Edinburgh two; whose election must be attested by the kirk-sessions of their respective boroughs. Every university sends one commissioner from its own body. The commissioners are chosen annually six weeks before the meeting of the assembly; and the ruling elders are often men of the first eminence in the kingdom for rank and talents. In this assembly, which meets once a year, the king presides by his commissioner, who is always a nobleman; but he has no voice in their deliberations. The order of their proceedings is regular, though sometimes the number of members creates a confusion, which the moderator, who is chosen from among the ministers to be, as it were, the speaker of the house, has not sufficient authority to prevent. Appeals are brought from all the other ecclesiastical courts in Scotland to the general assembly; and in questions purely religious no appeal lies from its determinations. —In the subordination of these assemblies, parochial, presbyterial, provincial, and national, the less unto the greater, consists the external order, strength, and steadfastness of the church of Scotland.

PRESCIENCE, in theology, prevision, or foreknowledge; that knowledge which God has of things to come.—The doctrine of predestination is founded on the prescience of God, and on the supposition of all futurity's being present to him. See PREDESTINATION.

PRESCRIPTION, in medicine, is the assigning a proper and adequate remedy to the disease, from an examination of its symptoms, and an acquaintance with the virtues and effects of the *materia medica*.

PRESCRIPTION, in law, is a title acquired by use and time, and allowed by law; as when a man claims any thing, because he, his ancestors, or they whose estate he hath, have had or used it all the time whereof no memory is to the contrary: or it is where for continuance of time, *ultra memoriam hominis*, a particular person hath a particular right against another.

There is a difference between prescription, custom, and usage. *Prescription* hath respect to a certain person, who by *intendment* may have continuance for ever; as for instance, he and all they whose estate he hath in such a thing, this is a prescription: but, *Custom*, is local, and always applied to a certain place; as, *time out of mind there has been such a custom in such a place*, &c. And *prescription* belongeth to one or a few only; but *custom* is common to all. *Usage* differs from both, for it may be either to persons or places; as to inhabitants of a town to have a way, &c.

A custom and prescription are in the right; usage is in the possession; and a prescription that is good for the matter and substance, may be bad by the manner of setting it forth: but where that which is claimed as a custom, in or for many, will be good, that regularly will be so when claimed by prescription for one. *Prescription* is to be

ral assem-
bly.

Prescrip-
tion
||
Present-
ment.

be *time out of mind*; though it is not the length of time that begets the right of prescription, nothing being done by time, although every thing is done in time; *but it is a presumption in law, that a thing cannot continue so long quiet, if it was against right, or injurious to another.*

PRESCRIPTION, in Scotch law. See **LAW**, p. 698, and 725.

PRESCRIPTION, in theology, was a kind of argument pleaded by Tertullian and others in the 3d century against erroneous doctors. This mode of arguing has been despised by some, both because it has been used by Papists, and because they think that truth has no need of such a support.

PRESENCE, a term of relation, used in opposition to absence, and signifying the existence of a person in a certain place.

PRESENT Tense, in grammar, the first tense of a verb, expressing the present time, or that something is now performing; as *scribo*, I write, or am writing. See **GRAMMAR**.

PRESENTATION, in ecclesiastical law. See **PATRONAGE**.

PRESENTATION of the Virgin, is a feast of the Romish church, celebrated on the 21st of November, in memory of the Holy Virgin's being presented by her parents in the temple, to be there educated. Emanuel Comnenus, who began to reign in 1143, makes mention of this feast in his Constitution. Some imagine it to have been established among the Greeks in the 11th century; and think they see evident proofs of it in some homilies of George of Nicomedia, who lived in the time of Phocas. Its institution in the West is ascribed to Gregory XI. in 1372. Some think it was instituted in memory of the ceremony practised among the Jews for their newborn females; corresponding to the circumcision on the eighth day for males.

PRESENTATION of our Lady also gives the title to three orders of nuns. The first, projected in 1618, by a maid named Joan of Cambray. The habit of the nuns, according to the vision she pretended to have, was to be a grey gown of natural wool, &c.; but this project was never accomplished. The second was established in France, about the year 1627, by Nicholas Sanguin, bishop of Senlis; it was approved by Urban VIII. This order never made any great progress. The third was established in 1664, when Frederic Borromeo, being apostolical visitor in the Valteline, was intreated by some devout maids at Morbegno to allow them to live in community in a retired place; which he granted, and erected them into a congregation, under the title of *congregation of our Lady*. They live under the rule of St Augustine.

PRESENTMENT, in law. See **PROSECUTION**.

A presentment, generally taken, is a very comprehensive term; including not only *presentments* properly so called, but also inquisitions of office, and indictments by a grand jury. A presentment, properly speaking, is the notice taken by a grand jury of any offence from their own knowledge or observation, without any bill of indictment laid before them at the suit of the king: As the presentment of a nuisance, a libel, and the like; upon which the officer of the court must afterwards frame an indictment, before the party presented can be put to answer it. An inquisition of office is the act of a jury, summoned by the proper officer to inquire of

matters relating to the crown, upon evidence laid before them. Some of these are in themselves convictions, and cannot afterwards be traversed or denied; and therefore the inquest, or jury, ought to hear all that can be alleged on both sides. Of this nature are all inquisitions of *felo de se*; of flight in persons accused of felony; of deodands, and the like; and presentments of petty offences in the sheriff's tourn or court-leet, whereupon the presiding officer may set a fine. Other inquisitions may be afterwards traversed and examined; as particularly the coroner's inquisition of the death of a man, when it finds any one guilty of homicide; for in such cases the offender so presented must be arraigned upon this inquisition, and may dispute the truth of it; which brings it to a kind of indictment, the most usual and effectual means of prosecution. See **INDICTMENT**.

PRESIDENT, **PRÆSES**, is an officer created or elected to preside over a company or assembly; so called in contradistinction to the other members, who are termed *residents*.

PRESIDENT of the United States of America. The officer in whom the executive power is vested by the constitution. He must be a natural born citizen of the United States, he must be at least thirty five years of age, and have resided fourteen years in the United States. He is chosen by electors appointed by the different States, equal in number to the Senators and Representatives in Congress, whose votes, sealed up, are transmitted to the President of the Senate, who opens and counts them in presence of the whole Congress, and the whole majority of votes decides. He holds his office for four years, and is commander in chief of the army and navy of the United States, and of the militia when called into the actual service of the United States; and by and with the consent of the Senate he has power to appoint ambassadors and other public ministers; he can fill up vacancies which happen during the recess of the Senate; he can convene and adjourn the Congress; receive ambassadors; take care that the laws be faithfully executed; and commission all the officers of the United States: but like all the officers of the United States, he shall be removed from office on impeachment for, and conviction of, treason, bribery or other high crimes and misdemeanors.

Vice-PRESIDENT of the United States, is chosen by the electors at the same time and in the same manner with the President. See above. He is the President of the Senate, but has no vote unless they be equally divided. The powers and duties of the President of the United States devolve on him in case of the removal of the President until a new President be elected.

PRESS (PRELUM), in the mechanic arts, a machine made of iron or wood, serving to squeeze or compress any body very close.

The ordinary presses consist of six members, or pieces; viz. two flat smooth planks; between which the things to be pressed are laid; two screws, or worms, fastened to the lower plank, and passing through two holes in the upper; and two nuts, in form of an S, serving to drive the upper plank, which is moveable, against the lower, which is stable, and without motion.

PRESSES used for expressing of Liquors, are of various kinds; some, in most respects, the same with the common presses, excepting that the under plank is per-

President,
Pres.

PREFS.

forated with a great number of holes, to let the juice expressed run through into a tub, or receiver, underneath.

A very useful machine for a prefs, in the process of cyder-making, has been lately constructed by Mr Anstice, who, with his well-known zeal for the improvement of mechanics, permits us to lay before our readers the following description of it.

Plate
CCCCXV.

AA, n^o 1. two pieces of timber, 21 feet long, 12 by 6 inches, laid side by side at the distance of 12 inches, and secured in that situation by blocks placed between and bolts passing through them; this frame forms the bed of the machine. BB, two uprights, 12 feet long, 6 by 8 inches, morticed upon them, and secured in their position by pins and iron squares. CC, two uprights, five feet long, six by 10 inches, morticed near the end of the under frame, and secured as before. D, a lever, 17 feet long, 12 by 13 inches, turning on a large bolt which passes through the short uprights, also through iron straps, which secure them to the bed inside, and a stirrup of iron which passes over the end of the lever, and which makes the turning point in the line of its lower side, and not through its middle. E, a lever 20 feet long, six by eight inches at its largest part, and tapering towards the other end: this lever turns on a bolt in the uprights BB. F. 1, 2, 3, 4. four pieces of oak (which he calls *needles*, 10 feet long), four by two and an half inches, morticed loosely into the upper lever, and hung thereto by bolts, so as to swing perpendicularly, and play in a long mortice or channel cut through the large lever to receive them. These needles have inch-holes pretty closely bored through them (in a direction crossing the machine), from the lower ends, as far upwards as the great lever will reach, when it is as high as it can go. G, a bed to receive what is to be pressed. H, a frame to support a winch worked by a handle at I. At the end of the small lever two blocks or pulleys are fixed, one above and the other below it; a rope of about half an inch diameter is then fastened to the ceiling (or continuation of the uprights of the winch frame if necessary) at K; then passed through the upper block on the lever, from thence passed through a block at L, and then goes with four turns round the winch, from whence it is carried through the block under the lever, and fastens to the machine at M; by this means, if the winch be turned one way, it raises the end of the small lever if the other depresses it.

To work the machine. If we suppose the great lever bearing on the matter to be pressed, an iron pin must be put into one of the holes in the needles above the great lever; and when the small lever is worked as far as it will go, either up or down, another bolt is to be put into the hole, which comes nearest above the great lever on the other side of the uprights BB, and the winch then turned the contrary way, by which means the pressing goes on whether the small lever rises or falls. Before the resistance is very great, the needles farthest from the fulcrum of the small lever are used; after that the nearest are employed, which doubles the power of the machine. In raising the great lever, or lowering it to its bearing, the needles most distant from the fulcrum of the small lever, are used *under* instead of *over* it. As the rope is liable to stretch and get slack, he passes it, after taking two turns on the winch, through a pulley, to which is suspended a weight

of half a hundred, and then takes two turns more before it is carried through the other block, by which means the slack is constantly gathered in, and the weight holds on without increasing the friction, as by hanging under the winch it counteracts the pressure upwards on its axis.

The power of this machine is very great, being as 1 to 1136 nearly, and capable by a trifling addition of any other proportion. It is applicable to many purposes beside cyder-pressing, and is more simple, and less liable to injury, than any other which has fallen under our observation. Perhaps, however, it would be an improvement to use, instead of the ropes and pulleys, by which the lever E is moved, a small wheel or pinion of 10 or 12 teeth, on the axis of the winch W. (n^o 2.), and a stiff beam *en* down from the lever, having on its lower end an iron rack, of which the teeth take into those of the pinion. The action of these teeth would, in our opinion, be less diminished by friction and obliquity, than the pulleys are by friction and the stiffness of the rope; and the machine would retain all its other advantages.

PRESS used by Joiners, to keep close the pieces they have glued, especially panels, &c. of wainscot, is very simple, consisting of four members; viz. two screws, and two pieces of wood, four or five inches square, and two or three feet long; whereof the holes at the two ends serve for nuts to the screws.

PRESS used by Inlayers, resembles the joiner's-press, except that the pieces of wood are thicker, and that only one of them is moveable; the other, which is in form of a tressel, being sustained by two legs or pillars, jointed into it at each end. This press serves them for sawing and cleaving the pieces of wood required in marquetry or inlaid work.

Founder's PRESS, is a strong square frame, consisting of four pieces of wood, firmly joined together with tenons, &c. This press is of various sizes, according to the sizes of the moulds; two of them are required to each mould, at the two extremes whereof they are placed; so as that, by driving wooden wedges between the mould and the sides of the presses, the two parts of the mould wherein the metal is to be run may be pressed close together.

Printing-PRESS. See *PRINTING-PRESS*.

Rolling-PRESS, is a machine used for the taking off prints from copper-plates. It is much less complex than that of the letter-printers. See its description and use under the article *Rolling-press PRINTING*.

PRESS, in *Coining*, is one of the machines used in striking of money; differing from the balance, in that it has only one iron bar to give it motion, and presses the moulds or coins; is not charged with lead at its extreme, nor drawn by cordage. See *COINING*.

Binder's Cutting-PRESS, is a machine used equally by book-binders, stationers, and pasteboard-makers; consisting of two large pieces of wood, in form of cheeks, connected by two strong wooden screws; which, being turned by an iron bar, draw together, or set asunder, the cheeks, as much as is necessary for the putting in the books or paper to be cut. The cheeks are placed lengthwise on a wooden stand, in the form of a chest, into which the cuttings fall. Aside of the cheeks are two pieces of wood, of the same length with the screws, serving to direct the cheeks, and prevent their opening unequally.

PREFS.

Press,
Pr. sing.

unequally. Upon the cheeks the plough moves, to which the cutting knife is fastened by a screw; which has its key, to dismount it, on occasion, to be sharpened.

The plough consists of several parts; among the rest a wooden screw or worm, which, catching within the nuts of the two feet that sustain it on the cheeks, brings the knife to the book or paper which is fastened in the press between two boards. This screw, which is pretty long, has two directories, which resemble those of the screws of the press. To make the plough slide square and even on the cheeks, so that the knife may make an equal paring, that foot of the plough where the knife is not fixed, slides in a kind of groove, fastened along one of the cheeks. Lastly, the knife is a piece of steel, six or seven inches long, flat, thin, and sharp, terminating at one end in a point, like that of a sword; and at the other in a square form, which serves to fasten it to the plough. See *Book-Binding*.

As the long knives used by us in the cutting of books or papers, are apt to jump in the cutting thick books, the Dutch are said to use circular knives, with an edge all round; which not only cut more steadily, but last longer without grinding.

Press, in the *Woollen Manufactory*, is a large wooden machine, serving to press cloths, ferges, rateens, &c. thereby to render them smooth and even, and to give them a gloss.

This machine consists of several members; the principal whereof are the cheeks, the nut, and the worm or screw, accompanied with its bar, which serves to turn it round, and make it descend perpendicularly on the middle of a thick wooden plank, under which the stuffs to be pressed are placed. The *CALENDER* is also a kind of press, serving to press or calender linens, silks, &c. *Press in the Cheese Manufactory* —

Liberty of the Press. See *LIBERTY of the Press*.

PRESSING, in the manufactures, is the violently squeezing a cloth, stuff, &c. to render it smooth and glossy.

There are two methods of pressing, viz. cold and hot.

As to the former, or cold pressing: After the stuff has been scoured, fulled, and thorn, it is folded square in equal plaits, and a skin of vellum or pasteboard put between each plait. Over the whole is laid a square wooden plank, and so put into the press, which is screwed down tight by means of a lever. After it has lain a sufficient time in the press, they take it out, removing the pasteboards, and lay it up to keep. Some only lay the stuff on a firm table after plaiting and pasteboarding, cover the whole with a wooden plank, and load it with a proper weight.

The method of pressing hot is this: When the stuff has received the above preparations, it is sprinkled a little with water, sometimes gum-water; then plaited equally, and between each two plaits are put leaves of pasteboard; and between every sixth and seventh plait, as well as over the whole, an iron or brass plate well heated in a kind of furnace. This done, it is laid upon the press, and forcibly screwed down. Under this press are laid five, six, &c. pieces at the same time, all furnished with their pasteboards and iron-plates. When the plates are well cooled, the stuffs are taken out and stitched a little together to keep them in the plaits.

This manner of pressing was only invented to cover the defects of the stuffs; and, accordingly, it has been frequently prohibited.

PRESSING, or *Impressing*. See *IMPRESSING*.

PRESSION, or PRESSURE, in the Cartesian Philosophy, is a supposed impulsive kind of motion, or rather an endeavour to move, impressed on a fluid medium, and propagated through it.

PRESSURE OF AIR. See *PNEUMATICS*.

PRESSURE of Fluids. See *HYDROSTATICS* and *PNEUMATICS*.

PREST, is used for a duty in money, to be paid by the sheriff on his account, in the exchequer, or for money left or remaining in his hands: 2 & 3 Edw. VI. c. 4.

PREST-Money, is so called from the French word *prest*, that is, *promptus, expeditus*; for that it binds those who receive it, to be ready at all times appointed, being commonly meant of soldiers.

PRESTATION-MONEY, is a sum of money paid yearly by archdeacons and other dignitaries to their bishop, *pro exteriori jurisdictione*.

PRESTATION (*præstatio*), was anciently used for other payments: *Et quieti sint de præstatione muragii*. Chart. Hen. VII. Sometimes also for *pourveyance*.

PRESTEIGN is a town in Radnorshire, distant 149 miles west-north-west from London, in the direct road to Aberystrwith, and throughout South Wales, in N. Lat. 52° 12', bounded to the north, and north-east by Herefordshire. It is a neat well built town, with clean and regular streets, and is the residence of many genteel families. The neighbourhood abounds with all the comforts and conveniences of life. It is seated on a gravelly soil on the banks of the river Lug, and at the head of a very fertile vale: the mountains to the west and north-west of the town forming, as it were, an amphitheatre round it. The name of it in Welsh is *Slan-Andras*, which is supposed to be derived from the church, which is dedicated to Saint Andrew. The town is divided into four wards, which have each a separate jurisdiction, separate officers, levies, &c. The curfew-bell of William the Conqueror still remains in this place, and is rung every night. It is a borough by prescription, and is governed by a bailiff annually elected, and sworn in by a steward appointed by the crown. The living is a rectory and vicarage united, and reported to be worth from L. 500 to L. 600 *per annum*; the parish lying in two counties. Here is an excellent free school well endowed. The county hall, the county gaol, the country bridewell, and house of correction, are kept in this place. The markets are held on Saturdays; and there are two fairs in the year. About a century and a half ago Presteign was considerably larger; had a good woollen manufactory, of which the very large buildings now standing (formerly belonging to clothiers) bear ample testimony, but a fire, succeeded by the plague, in the town about the year 1636, reduced the same, and with it, its consequence as a manufacturing town. The healthiness of its situation cannot be better ascertained than by the register of births and burials. The parish embraces at least a circle of 19 miles; and the average of burials for the last seven years was only 26 persons *per annum*, and that of births for the same time was 42; and of the former upwards of 18 were from 80 to 100 years old.

Pr. sing.
Pr. plur.

Prester
Preterition

PRESTER (John, or Jean), an appellation formerly given to an emperor of the Tartars who was overcome and killed by Jenghiz Khan. Since that time it has been given to the emperor of Abyssinia or Ethiopia; however, in Ethiopia itself this name is utterly unknown, the emperor being there called the *grand negus*.

PRESTER, a meteor, consisting of an exhalation thrown from the clouds downwards with such violence, as that by the collision it is set on fire. The word is Greek *σπινθηρ*, the name of a kind of serpent; called also *disphas*, to which this meteor is supposed to bear a resemblance. The prester differs from the thunderbolt in the manner of its inflammation; and in its burning and breaking every thing it touches with greater violence.

PRESTER, a word used by some to express the external part of the neck, which is usually inflated in anger.

PRESTIMONY, in canon law, is derived a *praestatio quotidiana*; and is, by some, defined to be a kind of benefice, served by a single priest. Others say, it is the incumbency of a chapel, without any title or collation; such as are most of those in castles, where prayers or masses are said; and which are mere unendowed oratories. Whence the term is also applied, in the Romish church, to certain perpetual offices bestowed on canons, religious, or others, for the saying of masses, by way of augmentation of their livings. Others think it is a lease, or concession of any ecclesiastical fund or revenue, belonging to a monastery, to be enjoyed during life. Du Moulin calls it a *profane benefice*, which, however, has a perpetual title, and an ecclesiastical office, with certain revenues attached to it; which the incumbent is allowed to sell, and which may be possessed without tithes; such as the lay church-wardens of Notre-dame. He adds, that, in propriety, the canonries of chapels are benefices of this nature. The most probable opinion seems to be, that prestimony is a fund, or revenue, appropriated by the founder for the subsistence of a priest, without being erected into any title of benefice, chapel, prebend, or priory; and which is not subject either to the pope or to the ordinary, but whereof the patron, and those who have a right from him, are the collators, and nominate and confer *pleno jure*.

PRESTO, in the Italian music, intimates to perform quick; as *prestissimo* does extremely quick.

PRESTON, a town of Lancashire in England, seated on the river Ribble, over which there is a handsome stone bridge. Here is held a court of chancery, and other offices of justice for the county palatine of Lancaster. It is noted for the defeat of the rebels here in 1715, when they were all made prisoners, and sent up to London. W. Long. 2. 26. N. Lat. 53. 45.

PRESTRE. See VAUBAN.

PRETENSED or **PRETENDED** right, in law, is where one is in possession of lands and tenements, which another, who is out, claims and sues for. Here the pretended right is in him who so claims or sues.

PRETERITE, in grammar, a tense which expresses the time past, or an action completely finished; as, *scripsi*, "I have written." See PERFECT and GRAMMAR.

PRETERITION, or **PRETERMISSION**, in rhetoric,

a figure whereby, in pretending to pass over a thing untouched, we make a summary mention thereof. *I will not say he is valiant, he is learned, he is just, &c.* The most artful praises are those given by way of preterition. See ORATORY.

PRETEXT, a colour or motive, whether real or feigned, for doing something.

TOGA PRETEXTA, among the ancient Romans, a long white gown, with a border of purple round the edges, and worn by children of quality till the age of puberty, viz. by the boys till 17, when they changed it for the *toga virilis*; and by the girls till marriage.

PRETIUM SEPULCHRI, in old law books, &c. those goods accruing to the church wherein a corpse is buried. In the Irish canons, lib. xix. cap. 6. it is ordered, that along with every body that is buried, there go his cow, horse, apparel, and the furniture of his bed; none of which may be disposed of otherwise than for the payment of debts, &c. as being familiars and domestics of the deceased.

PRETOR, a magistrate among the ancient Romans, not unlike the lord chief justices, or lord chancellor in England, or both in one; as being vested with the power of distributing justice among the citizens. At first there was only one pretor; but afterwards, another being created, the first or chief one had the title of *prator urbanus*, or the "city pretor;" the other was called *peregrinus*, as being judge in all matters relating to foreigners. But, besides these, there were afterwards created many provincial pretors; who were not only judges, but also assisted the consuls in the government of the provinces, and even were invested with the government of provinces themselves.

PRETORIAN GUARDS, in Roman antiquity, were the emperor's guards, who at length were increased to 10,000: they had this denomination, according to some, from their being stationed at a place called *Prætorium*; their commander was styled *praefectus praetorii*.

PRETORIUM, or **PRÆTORIUM**, among the Romans, denoted the hall or court wherein the pretor lived, and wherein he administered justice.

It likewise denoted the tent of the Roman general, wherein councils of war, &c. were held: also a place in Rome where the Pretorian guards were lodged.

PREVARICATION, in the civil law, is where the informer colludes with the defendants, and so makes only a sham prosecution.

PREVARICATION, in our laws, is when a man falsely seems to undertake a thing, with intention that he may destroy it; where a lawyer pleads booty, or acts by collusion, &c.

It also denotes a secret abuse committed in the exercise of a public office, or of a commission given by a private person.

PRIAM, king of Troy, was the son of Laomedon. He was carried into Greece after the taking of that city by Hercules; but was afterwards ransomed, on which he obtained the name of *Priam*, a Greek word signifying "ransomed." At his return he rebuilt Ilium, and extended the bounds of the kingdom of Troy, which became very flourishing under his reign. He married Hecuba, the daughter of Cisseus king of Thrace, by whom he had 19 children; and among the rest Paris, who

Pretext
Priam.

Priapismus who carried off Helen, and occasioned the ruin of Troy, which is supposed to have been sacked by the Greeks about 1184 B. C. when Priam was killed by Pyrrhus the son of Achilles at the foot of an altar where he had taken refuge, after a reign of 52 years. See **TROY**.

PRIAPISMUS, or **PRIAPISM**, is an erection of the penis without any concomitant pain, or the consent of other parts. It is thus called, because the person in this state resembles the lewd god Priapus. Cœlius Aurelianus says it is a palsy of the feminal vessels, and other nerves distributed to the parts about the penis, by the distension of which this disorder is produced. It is of the same nature as the satyr'asis. See **MEDICINE**, n° 372.

PRIAPUS, in Pagan worship, the son of Bacchus and Venus, who presided over gardens and the most indecent actions. He was particularly adored at Lampascus, a city at the mouth of the Hellespont, said to be the place of his birth; and his image was placed in gardens to defend them from thieves and birds destructive to fruit. He was usually represented naked, with a stern countenance, matted hair, and holding either a wooden sword or sickle in his hand, and with a monstrous privy; from whence downward his body ended in a shapeless trunk. The sacrifice offered to this obscene deity was the ass; either on account of the natural uncomeliness of this animal, and its propensity to venery, or from the disappointment which Priapus met with on his attempting the chastity of Vesta, while that goddess was asleep, when she escaped the injury designed her by her being awaked by the braying of old Silenus's ass.

PRICE (Rev. Richard), D. D. L. L. D. fellow of the Royal Society of London, and of the Academy of Sciences, New England, was born at Tynton in Glamorganshire, February 22, 1723. His father was a dissenting minister at Bridgend in that country, and died in 1739. At eight years old he was placed under a Mr Simmons of Neath; and in four years removed to Pentwyn in Caermarthenshire under the Rev. Samuel Jones, whom he represented as a man of a very enlarged mind, and who first inspired him with liberal sentiments of religion. Having lived as long with him as with Mr Simmons, he was sent to Mr Griffith's academy at Talgarth in Breconshire. In 1740 he lost his mother; and on this he quitted the academy and came to London. Here he was settled at that academy, of which Mr Eames was the principal tutor, under the patronage of his uncle the Rev. S. Price, who was co-pastor with Dr Watts upwards of 40 years. At the end of four years he left this academy, and resided with Mr Streatfield of Stoke Newington in the quality of domestic chaplain, while at the same time he regularly assisted Dr Chandler at the Old Jewry, and occasionally assisted others. Having lived with Mr Streatfield near 13 years, on his death and his uncle's he was induced to change his situation, and in 1757 married Miss S. Blundell of Leicestershire. He then settled at Hackney, but being shortly after chosen minister at Newington Green, he lived there until the death of his wife, which was in 1786, when he returned to Hackney. He was next chosen afternoon-preacher at the meeting-house in Poor Jewry-street, but this he resigned on being elected pastor of the Gravel-pit meeting Hackney, and afternoon-preacher at Newington Green. These he resigned with a farewell-sermon in February 1791. Shortly after he was attacked with a nervous

fever, which disappearing was succeeded by a disorder in his bladder, which reduced him to such a degree that, worn out with agony and disease, he died without a groin on the 19th April 1791. He left his property to a sister and two nephews.

Dr Kippis, speaking of his learning and pursuits, observes*, that "his chief aim was to lay a foundation for solid knowledge, by an application to sciences of the noblest kind. It was on the great and fundamental principles and obligations of morality, on the higher species of mathematics, on the sublimer parts of natural philosophy, on the true basis of government, and on the questions which relate to the essential welfare and dignity of man, that his studies were employed; and in the prosecution of these studies he not only enriched his own mind, but was enabled to become of eminent service to his country and to the world. In his moral writings he has laboured with distinguished ability to build the science of ethics on an immutable basis; and what he has advanced will always stand high in estimation as one of the strongest efforts of human reason in favour of the system he has adopted. For myself (adds Dr Kippis), I scruple not to say, that I regard the treatise referred to as a rich treasure of valuable information, and as deserving to be ranked among the first productions of its kind. With respect to his other ethical works, every one must admire the zeal, earnestness, and strength, with which he endeavours to lead men into pious views of God, of providence and prayer; and to promote the exercise of devout and amiable dispositions. In consequence of his profound knowledge in mathematical calculations, he was qualified at a particular crisis for being of singular utility to his fellow-citizens. A number of schemes for insurance for lives, and the benefit of survivorship, promising mighty advantages, were rising up in the metropolis. These ruinous schemes would have been carried to great excess had not Dr Price stepped forward and dispelled the delusion. Gratitude will not allow us to forget the ability and spirit with which he awakened the attention of his countrymen to the reduction of the national debt. With him it was that the scheme of the present minister for that purpose is understood to have originated. What crowned the whole of his character was, its being an assemblage of the most amiable and excellent private virtues. His piety was sincere, humble, and fervent; his soul pure and elevated; in his views disinterested and noble; and in his manners mild and gentle: the applause of his talents and virtues will be transmitted to future ages, and he will be united in the catalogue with the most eminent benefactors of mankind."

This is the panegyric of a friend; but with few abatements it will be admitted by every candid reader. In morals Dr Price's principles were those of Cudworth and Clarke; and by many who have themselves adopted a very different theory, he is allowed to have defended those principles with greater ability than any other writer in the English language (see *Moral Philosophy*, n° 14.). In metaphysics he was perhaps too great an admirer of Plato, from whom he has borrowed a doctrine concerning ideas which we confess ourselves unable to comprehend. He was a firm believer in the immateriality of the soul; but, with Dr Law, the late learned bishop of Carlisle, he thought, that from death to the resurrection of the body it remains in a dormant or

Price.

* Address for solid knowledge, by an application to sciences of the noblest kind. It was on the great and fundamental principles and obligations of morality, on the higher species of mathematics, on the sublimer parts of natural philosophy, on the true basis of government, and on the questions which relate to the essential welfare and dignity of man, that his studies were employed; and in the prosecution of these studies he not only enriched his own mind, but was enabled to become of eminent service to his country and to the world. In his moral writings he has laboured with distinguished ability to build the science of ethics on an immutable basis; and what he has advanced will always stand high in estimation as one of the strongest efforts of human reason in favour of the system he has adopted. For myself (adds Dr Kippis), I scruple not to say, that I regard the treatise referred to as a rich treasure of valuable information, and as deserving to be ranked among the first productions of its kind. With respect to his other ethical works, every one must admire the zeal, earnestness, and strength, with which he endeavours to lead men into pious views of God, of providence and prayer; and to promote the exercise of devout and amiable dispositions. In consequence of his profound knowledge in mathematical calculations, he was qualified at a particular crisis for being of singular utility to his fellow-citizens. A number of schemes for insurance for lives, and the benefit of survivorship, promising mighty advantages, were rising up in the metropolis. These ruinous schemes would have been carried to great excess had not Dr Price stepped forward and dispelled the delusion. Gratitude will not allow us to forget the ability and spirit with which he awakened the attention of his countrymen to the reduction of the national debt. What crowned the whole of his character was, its being an assemblage of the most amiable and excellent private virtues. His piety was sincere, humble, and fervent; his soul pure and elevated; in his views disinterested and noble; and in his manners mild and gentle: the applause of his talents and virtues will be transmitted to future ages, and he will be united in the catalogue with the most eminent benefactors of mankind."

Price.

quiescent state. He contended for its indivisibility, but maintained at the same time its extension; which furnished Dr Priestley with some advantages in their celebrated controversy, which his own acuteness would never have obtained. In propagating his political principles, which were republican, he sometimes expressed himself with undue vehemence; and he was a zealous enemy to all religious establishments which, in his opinion, encroach upon that liberty wherewith Christ has made us free. His faith respecting the Son of God was what has been called sometimes *low Arianism* and sometimes *Semi-arianism*. From a very early age he claimed the privilege of thinking for himself on every subject. His father was a rigid Calvinist, and spared no pains to instil his own theological dogmas into the tender mind of his son; but young Richard would often start his doubts and difficulties, and sometimes incur the old man's displeasure by arguing against his favourite system with an ingenuity that perplexed, and a solidity that could not be easily overturned. He had once the misfortune to be caught reading a volume of Clarke's sermons, which his father in great wrath snatched from him and threw into the fire. Perhaps he could not have taken a more effectual method to make the book a favourite, or to excite the young man's curiosity after the other works of the same author; and it is by no means improbable that this orthodox bigotry contributed more than any other circumstance to lay the foundation of his son's Arianism.

But whatever may be thought of Dr Price's speculative opinions, whether political or religious, his virtues in private life have never been called in question. Of his practical religion it is impossible to speak in terms too high. There was a fervour even in his public prayers which indicated the strongest sensibility as well as sincerity in himself, and communicated its warmth to those who joined with him. But in his family devotions he gave still fuller scope to the pious emotions of his soul, and proved to those friends who were occasionally present at them how deeply he felt religious impressions, and how happily he blended in this as well as in other things the cool decisions of the understanding with the amiable and exalted sensibilities of the heart.

But it was not in devotion only that these sensibilities were displayed. He was as exemplary in affection to his relatives as in love to his Maker. Of this he gave a striking though private instance before he first quitted his native place to try his fortune in London. His father had left to an elder brother by a former marriage a very considerable fortune; to Richard he left a mere trifle; and to each of two sisters still less. Our author divided his share between his sisters, reserving to himself only a few pounds to defray the expences of his journey, and trusting for his future support to the blessing of God upon his talents and his industry. As in early life he was an affectionate and generous brother, in old age he was a loving and attentive husband. His wife, who for a considerable time before her death was almost wholly helpless, found during the last years of her life hardly any enjoyment except in a game at whist; and though our Doctor disliked cards as a waste of time, and never touched them on any other occasion, to amuse her he would sit down every evening to the card-table, and play till it was late, with

a cheerfulness and good humour which charmed every person who had the happiness of viewing him in that endearing situation.

Yet, though thus attentive to the obligations of domestic life, he did not suffer his private affections to encroach upon his social duties. His talents and his labours were ever ready at the call of friendship; nay, so much did his nature abound with the milk of human kindness, that he could not resist without extreme reluctance even troublesome and unreasonable solicitations. His hours of study and retirement were frequently broken in upon by applications for assistance and advice, especially matters relating to annuities and life-insurances; and in this way he sacrificed much of his personal convenience to individuals of whom he knew but little, and from whom he would accept of no pecuniary recompense. His good nature in this respect amounted almost to a foible; and subjected him to importunities and loss of time, of which he would sometimes complain as interfering materially with more important and more generally useful studies.

Whilst he thus obliged the rich by his mental talents, he succoured the poor with his earthly substance. A fifth part of his annual income was regularly devoted to charitable purposes; and he was laudably anxious to distribute it in such a way as might produce the greatest good. In the practice of this, and indeed of all his virtues, he was utterly devoid of ostentation. Simplicity and humility were among the strong features of his character. No man was ever less sensible of his own excellence, or less elated by his own celebrity; and in no man was the dignity of artless manners and unaffected modesty more happily displayed.

His face was the true index of his mind. It beamed with philanthropy; and when lighted up in conversation with his friends, assumed an aspect peculiarly pleasing. His person was slender, and rather below the common size, but possessed of great muscular strength and remarkable activity. A habit of deep thought had given a stoop to his figure, and he generally walked a brisk pace with his eyes on the ground, his coat buttoned, one hand in his pocket, and the other swinging by his side.

It is natural to suppose that such a man as Dr Price, some of whose writings were translated into foreign languages, would be very generally respected in the republic of letters, and have many correspondents. The supposition is well founded. In 1763 or 1764 he was chosen a fellow of the Royal Society, and contributed largely to the transactions of that learned body; in 1769 he received from Aberdeen a diploma creating him DD.; and in 1783 the degree of LL.D. was conferred upon him by the college of Yale in Connecticut. As in 1770 he had refused an American degree which had been conveyed to him by Dr Franklin, his acceptance of one 13 years afterwards can be attributed only to his very great regard for a republican form of government; which was a peculiar trait in his character, and shows what strong attachments the vigorous mind will imbibe by thinking always on the same subjects, and in the same track. Among his correspondents, the most eminent in his own country were the late Lord Chatham, Lord Stanhope, Lord Linsdowne, the late bishops of Carlisle and St Asaph, and the present bishop of Landaff; Mr Hume, Mr Harris of Salisbury,

Price.

Price.

lisbury, Dr Gregory of Edinburgh, and the celebrated Mr Howard, who lived with him on terms of the greatest intimacy; in America he corresponded with Dr Franklin, Dr Chauncey, Mr Adams, and others; and in France with the celebrated Turgot, the Duke de Rochefoucault, and several of the first national assembly. One of his female correspondents sketched his character with great justice many years ago under the fictitious but well applied name of *Simplicius*; and with this character we shall close these short memoirs.

"While the vain man is painfully striving to outshine the company and to attract the admiration by false wit, forced compliments, and studied graces, he must surely be mortified to observe how constantly *Simplicius* engages their attention, respect, and complacency, without having once thought of himself as a person of any consequence among them. *Simplicius* imparts his superior knowledge, when called upon, as easily and naturally as he would tell you what it is o'clock; and with the same readiness and good will informs the most ignorant or confers with the most learned. He is as willing to receive information as to give it, and to join the company, as far as he is able, in the most trifling conversation into which they may happen to fall as in the most serious and sublime. If he disputes, it is with as much candour on the most important and interesting as on the most insignificant subjects; and he is not less patient in hearing than in answering his antagonist. If you talk to him of himself or his works, he accepts praise or acknowledges defects with equal meekness, and it is impossible to suspect him of affectation in either. We are more obliged by the plain unexaggerated expressions of his regard, than by the compliments and attentions of the most accomplished pattern of high breeding; because his benevolence and sincerity are so strongly marked in every look, word, and action, that we are convinced his civilities are offered for our sakes, not for his own, and are the natural effects of real kindness, not the studied ornaments of behaviour. Every one is desirous to show him kindness in return, which we know will be accepted just as it is meant. All are ready to pay him that deference which he does not desire, and to give him credit for more than he assumes, or even more than he possesses. With a person ungraceful, and with manners unpolished by the world, his behaviour is always proper, easy, and respectable; as free from constraint and servility in the highest company, as from haughtiness and insolence in the lowest. His dignity arises from his humility; and the sweetness, gentleness, and frankness of his manners, from the real goodness and rectitude of his heart, which lies open to inspection in all the fearlessness of truth, without any need of disguise or ornament."

Such was Dr Price.—Of his public principles men will think differently; of his private worth there can be but one opinion. He will live in the memory of his friends till memory has lost her power. To posterity his works will be his monument. They are: A Review of the principal Questions and Difficulties in Morals, 8vo, 1758; Dissertations on Providence, &c. 8vo, 1767; Observations on Reversionary Payments, &c. 8vo, 1771; Appeal on the National Debt, &c. 8vo, 1773; Observations on the Nature of Civil Liberty, 1776; on Materialism and Necessity, in a correspon-

Vol. XV.

dence between Dr Price and Dr Priestley, 1779; on Annuities, Assurances, Population, &c. 8vo, 1779; on the Population of England, 1780; on the Public Debts, Finances, Loans, &c. 8vo, 1783; on Reversionary Payments, 2 vols, 1783; on the importance of the American Revolution, 1784: besides Sermons, and a variety of papers in the Philosophical Transactions on astronomical and other philosophical subjects.

PRIDE, inordinate and unreasonable self-esteem, attended with insolence and rude treatment of others.—It is frequently confounded with vanity, and sometimes with dignity; but to the former passion it has no resemblance, and in many circumstances it differs from the latter. Vanity is the parent of loquacious boasting; and the person subject to it, if his pretences be admitted, has no inclination to insult the company. The proud man, on the other hand, is naturally silent, and, wrapt up in his own importance, he seldom speaks but to make his audience feel their inferiority. It is this circumstance which distinguishes pride from dignity, and constitutes its sinfulness. Every man possessed of great powers of mind is conscious of them, and feels that he holds a higher rank in the scale of existence than he whose powers are less. If he recollect, at the same time, that he has nothing which he did not receive, and that his superiority is owing to the good pleasure of Him who forms his creatures differently, as the potter forms his clay; he will be so far from insulting his inferiors, that when necessarily in company with them, he will bear with their foibles, and, as far as is proper, make them lose sight of the distance which the laws of God and man have for ever placed between them and him. This condescension, however, if he be a man of dignity, will never lead him to join with them in any mean or dirty action. He will even excuse in them many things which he would condemn in himself, and give them his good wishes, after they have forfeited his esteem. Such a character is amiable and respectable, and what every man should labour to obtain. From the weakness of human nature, however, it is too apt to degenerate into pride.

To a man of great intellectual powers and various erudition, the conversation of ordinary persons affords neither instruction nor amusement; and such conversation, when often repeated, must, from the nature of things, become tedious and irksome. But it requires great command of temper and of manners to prevent uneasiness long felt from sometimes betraying itself by external symptoms, such as peevish expressions, a forbidding look, or absence of mind; and these are the infallible indications of contempt for the company, the very worst ingredient in the passion of pride. If this contempt be often excited, it will be formed into a habit; and the proud man will be so much under its influence, as to insult his inferiors, and sometimes his equals, without forming the resolution to insult either the one or the other. Such a character is hateful to every company, and is so far from indicating true dignity of mind in him to whom it belongs, that it is obviously associated with meanness, and indicates a consciousness of some radical defect. He who possesses real and conspicuous merit has no occasion to depress others for the purpose of raising himself; his superiority will be cheerfully acknowledged; but when a man of undoubted

Pride.

Pride
Priene.

eminence in one respect, is so swollen with pride as to make him wish to appear great in all respects, he has no other means of enforcing his ill-founded claim, than displaying his acknowledged superiority, with such insolence as may drive at a distance from him every person by whom he is conscious that in many instances he might be more than rivalled. Whoever is proud of knowledge, would do well to consider how much knowledge he wants.

The same observations which we have made on pride of parts will apply to every other species of pride, such as pride of birth, office, or riches, &c. The peace and order of society require difference of rank, accompanied with different degrees of authority; and he who inherits a title or office from his ancestors, may without pride be conscious of his superiority, provided he forget not that such superiority is conferred on families and individuals, not for their own sakes, but for the good of the community. The peer, who keeps this circumstance in mind, may maintain his station, and repress the forward petulance of the plebeian, without giving offence to any thinking man; but if he dwell upon his rank with too much complacency, he will in process of time be apt to consider himself and his family as superior by nature to those upon whom no title has been conferred, and then his pride will become intolerable. If we could trace our descent, says Seneca, we should find all slaves to come from princes, and all princes from slaves. To be proud of knowledge, is to be blind in the light; to be proud of virtue, is to poison ourselves with the antidote; to be proud of authority, is to make our rise our downfall. The best way to humble a proud man is to neglect him.

PRIDEAUX (Humphry) was born at Padstow in Cornwall in 1648, and was honourably descended by both parents. Three years he studied at Westminster under Dr Busby; and then was removed to Christchurch, Oxford. Here he published, in 1676, his *Marmora Oxoniensia ex Arundelianis, Seldenianis, aliiſque conſtata, cum perpetuo Commentario*. This introduced him to the lord chancellor Finch, afterwards earl of Nottingham, who in 1679 presented him to the rectory of St Clements near Oxford, and in 1681 bestowed on him a prebend of Norwich. Some years after he was engaged in a controversy with the Papists at Norwich, concerning the validity of the orders of the church of England, which produced his book upon that subject. In 1688 he was installed in the archdeaconry of Suffolk; to which he was collated by Dr Lloyd, then bishop of Norwich. In 1691, upon the death of Dr Edward Pococke, the Hebrew professorship at Oxford being vacant, was offered to Dr Prideaux, but he refused it. In 1697, he published his *Life of Mahomet*, and in 1702 was installed dean of Norwich. In 1710 he was cut for the stone, which interrupted his studies for more than a year. Some time after his return to London, he proceeded with his *Connection of the History of the Old and New Testament*; which he had begun when he laid aside the design of writing the *History of Appropriations*. He died in 1724.

Travels in
Asia Mi-
nor.

PRIENE, an ancient town of Asia Minor. It is now called *Samſun*, and *Samſun-kateſi*, which do not however appear to be very recent. It was taken in 1391 by Bajazet, who subdued Ionia. It had formerly, without including the citadel, three gateways; one

of which was towards Kelibeth, an adjoining village; and without it are vaults of sepulchres. The entrance was not wide. A part of the arch, consisting of a single row of massive stones, still remains; but those on which it rests are so corroded by age, broken, or distorted, as to seem every moment ready to yield and let down their load. A rugged way leads to a second opening in the wall opposite to this, and about a mile from it; beyond which are likewise vaults of sepulchres. Between these was a gate facing to the plain; and on the left hand going out of it is a hole, resembling the mouth of an oven, in the side of a square tower; and over it an inscription in small characters, exceedingly difficult to be read. It signifies, that a certain Cyprian in his sleep had beheld Ceres and Proserpine arrayed in white; and that in three visions they had enjoined the worship of a hero, the guardian of the city, and pointed out the place where, in obedience to them, he had erected the god. This was probably some local hero, whose little image was set in the wall, and whose name and memory have perished.

PRIEST, a person set apart for the performance of sacrifice, and other offices and ceremonies of religion. Before the promulgation of the law of Moses, the first born of every family, the fathers, the princes, and the kings, were priests. Thus Cain and Abel, Noah, Abraham, Melchizedec, Job, Isaac, and Jacob, offered themselves their own sacrifices. Among the Israelites, after their exod from Egypt, the priesthood was confined to one tribe, and it consisted of three orders, the *high-priest*, *priests*, and *Levites*. The priesthood was made hereditary in the family of Aaron, and the first-born of the oldest branch of that family, if he had no legal blemish, was always the high-priest. This divine appointment was observed with considerable accuracy till the Jews fell under the dominion of the Romans, and had their faith corrupted by a false philosophy.—Then, indeed, the high-priesthood was sometimes set up to sale, and instead of continuing for life, as it ought to have done, it seems from some passages in the New Testament, to have been nothing more than an annual office. There is sufficient reason, however, to believe, that it was never disposed of but to some descendant of Aaron, capable of filling it, had the older branches been extinct. (For the consecration and offices of the Jewish priesthood, we refer our readers to the books of Moses). In the time of David, the inferior priests were divided into 24 companies, who were to serve in rotation, each company by itself, for a week. The order in which the several courses were to serve was determined by lot; and each course was in all succeeding ages called by the name of its original chief.—All nations have had their *priests*. The Pagans had *priests* of Jupiter, Mars, Bacchus, Hercules, Osiris, and Isis, &c.; and some deities had *priestesses*. The Mahometans have priests of different orders, called *schick* and *mufti*; and the Indians and Chinese have their *bramins* and *bonzes*.

It has been much disputed, whether, in the Christian church, there be any such officer as a *priest*, in the proper sense of the word. The church of Rome, which holds the *propitiatory* sacrifice of the *mass*, has of course her proper *priesthood*. In the church of England, the word *priest* is retained to denote the second order in her hierarchy, but we believe with very different significations, according to the different opinions entertained of the

Priest.

Lord's

Primæ
||
Primer.

Lord's supper. Some few of her divines, of great learning, and of undoubted Protestantism, maintain that the Lord's supper is a *commemorative* and *eucharistical sacrifice*. These consider all who are authorized to administer that sacrament as in the strictest sense *priests*. Others hold the Lord's supper to be a *feast* upon the *one* sacrifice, once offered on the cross; and these too must consider themselves as clothed with some kind of priesthood. Great numbers, however, of the English clergy, perhaps the majority, agree with the church of Scotland, in maintaining that the Lord's supper is a rite of no other moral import, than the mere commemoration of the death of Christ. These cannot consider themselves as *priests* in the rigid sense of the word, but only as *presbyters*, of which the word *priest* is a contradiction of the same import with *eld.r.* See *SUPPER of the Lord*.

PRIMÆ VIÆ, among physicians, denote the whole alimentary duct; including the œsophagus, stomach, and intestines, with their appendages.

PRIMAGE, in commerce, a small duty at the water-side, usually about 12d. *per* ton, or 6d. *per* bale, due to the master and mariners of a ship.

PRIMARY, first in dignity, chief, or principal.

PRIMARY *Qualities of Bodies*. See METAPHYSICS, n° 152.

PRIMATE, in church-polity, an archbishop, who is invested with a jurisdiction over other bishops.

PRIME, PRIMUS, an appellation given to whatever is first in order, degree, or dignity, among several things of the same or like kind; thus we say, the prime minister, prime cost, &c.

Prime is sometimes used to denote the same with decimal, or the tenth part of an unit.

PRIME-Figure, in geometry, one which cannot be divided into any other figures more simple than itself, as a triangle among planes, and the pyramid among solids.

For prime numbers, in arithmetic, see the article NUMBER.

PRIME of the Moon, is the new moon when she first appears, which is about three days after the change.

PRIME Vertical, is that vertical circle which passes through the poles of the meridian, or the east and west points of the horizon; whence dials projected on the plane of this circle are called *prime vertical*, or *north-and-south dials*.

PRIME, in the Romish church, is the first of the canonical hours, succeeding to lauds.

PRIME, in fencing, is the first of the chief guards. See GUARD.

PRIMER SEISIN, in feudal law, was a feudal burden, only incident to the king's tenants *in capite*, and not to those who held of inferior or mesne lords. It was a right which the king had, when any of his tenants *in capite* died seized of a knight's fee, to receive of the heir (provided he were of full age) one whole year's profits of the lands if they were in immediate possession, and half a year's profits if the lands were in reversion expectant on an estate for life. This seems to be little more than an additional relief, (see RELIEF); but grounded upon this feudal reason, That, by the ancient law of feods, immediately upon the death of a vassal the superior was entitled to enter and

take seisin or possession of the land, by way of protection against intruders, till the heir appeared to claim it, and receive investiture: and for the time the lord so held it, he was entitled to take the profits; and unless the heir claimed within a year and day, it was by the strict law a forfeiture. This practice however seems not to have long obtained in England, if ever, with regard to tenures under inferior lords; but, as to the king's tenures *in capite*, this *prima seisin* was expressly declared, under Hen. III. and Ed. II. to belong to the king by prerogative, in contradistinction to other lords. And the king was entitled to enter and receive the whole profits of the land, till livery was sued; which suit being commonly within a year and day next after the death of the tenant, therefore the king used to take at an average the *first-fruits*, that is to say, one year's profits of the land. And this afterwards gave a handle to the popes, who claimed to be feudal lords of the church, to claim in like manner from every clergyman in England the first year's profits of his benefice, by way of *primitiæ*, or first-fruits.—All the charges arising by primer seisin were taken away by 12 Car. II. c. 24.

PRIMING, in gunnery, the train of powder that is laid, from the opening of the vent, along the gutter or channel on the upper part of the breech of the gun: which, when fired, conveys the flame to the vent, by which it is further communicated to the charge, in order to fire the piece. This operation is only used on shipboard at the proof, and sometimes in garrison; for, on all other occasions, tubes are used for that purpose.

PRIMING-Wire, in gunnery, a sort of iron needle employed to penetrate the vent or touch-hole of a piece of ordnance, when it is loaded: in order to discover whether the powder contained therein is thoroughly dry and fit for immediate service; as likewise to search the vent and penetrate the cartridge, when the guns are not loaded with the loose powder.

PRIMING, among painters, signifies the laying on of the first colour.

PRIMIFILUS, in antiquity, the centurion of the first cohort of a legion, who had the charge of the Roman eagle.

PRIMITIÆ, the first-fruits gathered of the earth, whereof the ancients made presents to the gods.

PRIMITIVE, in grammar, is a root or original word in a language, in contradistinction to *derivative*; thus, *God* is a primitive; *godly*, a derivative; and *god-like*, a compound.

PRIMOGENITURE, the right of the first-born, has among most nations been very considerable. The first-born son in the patriarchal ages had a superiority over his brethren, and, in the absence of his father, was priest to the family. Among the Jews,* he was consecrated to the Lord, had a double portion of the inheritance, and succeeded in the government of the family or kingdom. It is, however, remarkable, and unquestionably shows the connection between this institution and the birth and office of our Saviour, that if a woman's first child was a girl, neither she, nor the children that came after her, were consecrated.

In every nation of Europe, the right of primogeniture prevails in some degree at present, but it did not prevail

Priming
||
Primogeniture.

Primorie, Primula. prevail always. The law which calls the elder-born to the crown, preferably to all others, was not introduced into France till very late; it was unknown to the first race of kings, and even to the second. The four sons of Clovis shared the kingdom equally among themselves; and Louis le Debonnaire did the same: it was not till the race of Hugh Capet, that the prerogative of succession to the crown was appropriated to the first-born.

By the ancient custom of *Gavel-kind*, still preserved in some parts of Britain, primogeniture is of no account; the paternal estate being equally shared by all the sons. And it has been a matter of violent and learned dispute, whether, at the death of Alexander III. Baliol or Bruce was, by the law as it then stood, heir to the crown of Scotland. The former had undoubtedly the right of primogeniture, but the latter stood in one degree of nearer relation to the deceased sovereign: and the Scottish barons, not being able to determine whose claim was best founded, referred the question to Edward I. of England, and thereby involved their country in a long and ruinous war. See SCOTLAND.

PRIMORIE, is a name given by the Slavi to that tract of sea-coast which lies between the two rivers Cetina and Narenta, the first of which is the Nestus and Tiluras, and the second the Narus, of the ancients; comprising what was properly called Dalmatia two ages before our era, and which was known to the Greeks of the low times under the name of *Paratalassia*. Appian informs us, that the Ardei or Vardei possessed many cities there, part of which they seized before the invasion of the Romans, and part they built themselves. We learn also from the *Tabula Peutingeriana*, that after the conquest many of those cities remained, and were inhabited by the conquerors, who also founded new settlements. And indeed were these proofs wanting, the numerous inscriptions found near the sea, and sometimes among the hills, would render it at least probable. The coast is extremely pleasant, the soil fertile, and the situation most convenient for commerce with the inland provinces. By bad management, however, much ground has been lost near the sea, by its being covered with gravel, and by imprudent cultivation of the hills, the impetuous fury of the mountain torrents has rendered a part of it uninhabitable. Macarska is now the only town in the territory, and it appears to have risen out of the ruins of the ancient RATANEUM of Pliny. It formed a part of the Narentan state for several ages, and afterwards, together with the rest of Primorie, passed under the obedience of various Christian princes. It afterwards became subject to the Ottoman Porte, and at last voluntarily subjected itself to the Venetian republic. See DALMATIA and MACARSKA. See also Fortis's *Travels into Dalmatia*, p. 265—318.

PRIMULA, the PRIMROSE: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 21st order, *Precia*. The involucre lies under a simple umbel; the tube of the corolla cylindrical; with the mouth or limb patulous. This genus, including also the polyanthus and auricula, furnishes an excellent collection of low, fibrous-rooted, herbaceous flowery perennials.

1. The *primula veris*, or spring primrose, has thick and very fibrous roots, crowned by a cluster of large

oblong indented rough leaves, and numerous flower-stalks, from about three or four, to five or six inches high; each terminated commonly by one flower.—The varieties are, common yellow-flowered primrose of the woods—white primrose—paper-white—red—double red—double yellow, and double white.—All these flower abundantly in March and April, and continue for a month or six weeks.

The cowslip primrose, or cowslip, has very thick fibrous roots, crowned by a cluster of oblong, indented round leaves, and upright, firm, flower-stalks five or six inches high, terminated each by a cluster of small flowers. The varieties are, Common single yellow cowslip of the meadows—double yellow cowslip—scarlet cowslip—hose-and-hose cowslip; one flower growing out of the bosom of another, the lowermost serving as a calyx; all of which varieties have the flower-stalks crowned by many flowers in branches.—They flower in April and May, continuing in succession a month or six weeks.

2. The polyanthus, has thick fibrous roots, increasing into large bunches, crowned with a cluster of large oblong indented rough leaves; amidst them upright flower-stalks six or eight inches high, terminated mostly by a cluster of several spreading flowers of many different colours in the varieties. The principal are, purple, red, gold, orange-coloured, &c. They all flower beautifully in April and May, and frequently again in autumn; and sometimes even in winter, if the season is mild. The polyanthus is one of the noted prize-flowers among the florists; many of whom are remarkably industrious in raising a considerable variety of different sorts, as well as in using every art to blow them with all requisite perfection; for, among the virtuosi, a polyanthus must possess several peculiar properties in order to be admitted in their collections. The chief properties required in a florist's polyanthus are, 1. The stem or flower-stalk shall be upright, moderately tall, with strength in proportion, and crowned by a good regular branch of flowers on short pedicles, strong enough to support them nearly in an upright position. 2. The florets of each branch should be equally large, spreading open flat, with the colours exquisite, and the stripes and variegations lively and regular. 3. The eye in the centre of each floret should be large, regular, and bright; and the antheræ, by the florists called the *thrum*, should rise high enough to cover the mouth of the tube or hollow part in the middle of the florets, and render them what they call *thrum-eyed*; but when the style elevates the stigma above the antheræ, the eye of the tube generally appears hollow, showing the stigma in the middle, like the head of a pin, and is rejected as an incomplete flower, though its other properties should be ever so perfect. This pin-eyed polyanthus, however, though rejected by the florists, is the flower in its most perfect state, and great numbers of them are of as beautiful forms and colours as the thrum-eyed varieties.

3. The auricula has a thick fibrous root, crowned by a cluster of oblong, fleshy, broad, serrated, smooth leaves, resembling the shape of a bear's ear; and amidst them upright flower-stalks from about three or four to six or eight inches high, terminated by an umbellate cluster of beautiful flowers, of many different colours.

Primula.

Prinum,
Prince.

colours in the varieties. All of these have a circular eye in the middle of each flower, and of which there are different colours; whence the auriculas are distinguished into yellow-eyed, white-eyed, &c. The petals of most of the kinds are powdered with an exceeding fine farina or mealy powder, which contributes greatly to the beauty of the flower. They all flower in April or May, continuing a month or six weeks in beauty, and ripening plenty of seeds in June.

Culture. All the varieties of the common spring primrose multiply so fast by the roots, that it is scarce worth while to raise them from seeds. However, though many single kinds may be raised from seed, yet parting the roots is the only method by which the double kind can be preserved; and the same thing is to be observed of all the rest.

PRIMUM MOBILE, in the Ptolemaic astronomy, the ninth or highest sphere of the heavens, whose centre is that of the world, and in comparison of which the earth is but a point. This they will have to contain all other spheres within it, and to give motion to them, turning itself, and all them, quite round in 24 hours.

PRINCE, PRINCEPS, in polity, a person invested with the supreme command of a state, independent of any superior.

PRINCE also denotes a person who is a sovereign in his own territories, yet holds of some other as his superior; such are the princes of Germany, who, though absolute in their respective principalities, are bound to the emperor in certain services.

PRINCE also denotes the issue of princes, or those of the royal family. In France, before the revolution, they were called *princes of the blood*, and during the short continuance of the constitution of 1791, *French princes*. In England the king's children are called *sons and daughters of England*; the eldest son is created prince of Wales; the cadets are created dukes or earls as the king pleases; and the title of all the children is *royal highness*; all subjects are to kneel when admitted to kiss their hand, and at table out of the king's presence they are served on the knee. See *ROYAL Family*.

PRINCE of the Senate, in old Rome, the person who was called over first in the roll of senators, whenever it was renewed by the censors: he was always of consular and censorian dignity. See the article SENATE.

PRINCE's Metal, a mixture of copper and zinc, in imitation of gold. See CHEMISTRY, n° 1154.

PRINCETOWN. See *NEW JERSEY*.

PRINCE of Wales's Island, or *Polu Penang*, is situated in the entrance of the straits of Malacca, in 100 degrees of east longitude, and in five degrees of north latitude. It is about seven leagues in length and three in breadth. Its northern extremity runs nearly parallel with the main land at a distance of about two miles, by which a fine channel is formed, where the greatest fleets might ride in perfect safety, the height of the surrounding mountains acting as a barrier against the force of the prevailing winds. The climate, considering its vicinity to the equator, is remarkably mild. Eighty degrees is about the mean height of the thermometer at noon; which, during the night, is seldom above 70. Its healthfulness is certainly not surpassed by that of any European settlement on the coast. Out of a garrison of 300 troops (natives of Hindostan), not one died for the space of 14 months; a singular fact to be experienced

by a new settlement in an uncleared country. This great salubrity is perhaps the effect of a constant ventilation, supported by almost continued but gentle breezes, added to the dryness of the soil, the uniform but gradual elevation from the sea to the foot of the hills preventing those stagnations of water which, in tropical latitudes, are so highly prejudicial to the health of man.

A ridge of beautiful mountains, deeply indented with valleys, and covered with evergreens, divides the island longitudinally. Innumerable rivulets receive their origin from these mountains, and are remarkable for the transparency and coolness of their waters. The soil, which is light and sandy near the sea, gradually changes to a rich clay as it approaches to the high lands. There the sugar-cane grows with the utmost luxuriance, and the most plentiful crops of rice are everywhere produced. The gardens have already furnished the inhabitants with cabbages and potatoes; and when industry shall have reached the tops of the mountains, it will be no surprise to see in the plantations most of the productions of Europe in their utmost perfection. In decorating the landscapes of this little island, nature has been peculiarly lavish. An assemblage of flowering trees and shrubs in perpetual blossom, and endless in the variety of their species, form the first shade. These are overtopped by forest trees of an immense height, which spread their vast branches on every side, and are covered with the richest foliage. Here strangers feel with rapture the effect of the breezes, which, from whatsoever quarter they blow, are strongly impregnated with the fragrance of the groves.

The original animal productions of this island are very limited. Of quadrupeds, the wild hog, deer, and squirrel, nearly comprehend the whole: but the absence of the tiger and leopard, whose numbers and ferocity almost render the opposite shores uninhabitable, amply compensates for this deficiency. The flying fox and squirrel are natives of this island; the former a nondescript, and a great natural curiosity. Of birds there are also but few, and only one which is remarkable for the melody of its notes. The crow and sparrow, the never-failing attendants on population, have but lately made their appearance. They are now, however, rapidly increasing and multiplying. All the domestic animals arrive here at great perfection.

The sea which surrounds the island, affords a vast variety of fish of the most delicious flavour, and its shores abundance of the finest turtle and oysters. In no situation indeed are the conveniences and luxuries of life enjoyed in greater profusion. The advantages of the island in a political and commercial view, are too obvious to require to be pointed out.

PRINCE William's Sound, situated on the north west coast of America, and so named by Captain Cook in 1778. The men, women, and children of this sound are all clothed in the same manner. Their ordinary dress is a sort of close frock, or rather robe, which sometimes reaches only to the knees, but generally down to the ankles. These frocks are composed of the skins of various animals, and are commonly worn with the hairy side outwards. The men often paint their faces of a black colour, and of a bright red, and sometimes of a bluish or leaden hue; but not in any regular

&c.

Prince,
Principal.

lar figure. The women puncture or stain the chin with black, that comes to a point in each of their cheeks. Their canoes are of two sorts; the one large and open, the other small and covered. The framing consists of slender pieces of wood, and the outside is composed of the skins of seals, or other sea animals, stretched over the wood. Their weapons, and implements for hunting and fishing, are the same as those used by the Greenlanders and Esquimaux. Many of their spears are headed with iron, and their arrows are generally pointed with bone. The food they were seen to eat was the flesh of some animal, either roasted or broiled, and dried fish. Some of the former that was purchased had the appearance of bear's flesh. They also eat a larger sort of fern-root, either baked or dressed in some other method. Their drink, in all probability, is water; for, in their canoes, they brought snow in wooden vessels, which they swallowed by mouthfuls. Our knowledge of the animals of this part of the American continent is entirely derived from the skins that were brought by the natives for sale. These were principally of bears, common and pine martins, sea-otters, seals, racoons, small ermines, foxes, and the whitish cat or lynx. The birds found here were the halcyon, or great king's-fisher, which had fine bright colours; the white-headed eagle, and the humming-bird. The fish that were principally brought to market for sale were torrk and halibut. The rocks were almost destitute of shell-fish; and the only other animal of this tribe that was observed was a reddish crab, covered with very large spines. Few vegetables of any kind were observed; and the trees that chiefly grew about this found were the Canadian spruce pine, some of which were of a considerable size. E. Long. 115. 21. N. Lat. 59. 33.

PRINCIPAL, the chief and most necessary part of a thing. The principal of a college or hall is the master thereof.

In commerce, principal is the capital of a sum due or lent; so called in opposition to interest. See INTEREST.

It also denotes the first fund put by partners into a common stock, by which it is distinguished from the calls or accessions afterwards required.

PRINCIPAL, in music. See FUNDAMENTAL, in music, and GENERATOR, in music.

PRINCIPAL, in law, is either the actor or absolute perpetrator of the crime, who is called a *principal*, in the first degree; or he who is present, aiding and abetting the fact to be done, who is denominated a *principal* in the second degree. The presence of a principal need not always be an actual immediate standing by, within sight or hearing of the fact; but there may be also a constructive presence, as when one commits a robbery or murder, and another keeps watch or guard at some convenient distance. And this rule has also other exceptions; for in case of murder by poisoning, a man may be a principal felon by preparing and laying the poison, or giving it to another (who is ignorant of its poisonous quality) for that purpose; and yet not administer it himself, nor be present when the very deed of poisoning is committed. And the same reasoning will hold, with regard to other murders committed in the absence of the murderer, by means which he had prepared before-hand, and which probably could

not fail of their mischievous effect. As by laying a trap or pit-fall for another, whereby he is killed; letting out a wild beast, with an intent to do mischief; or exciting a madman to commit murder, so that death thereupon ensues: in every one of these cases the party offending is guilty of murder as a principal, in the first degree. For he cannot be called an accessory, that necessarily presupposes a principal; and the poison, the pit-fall, the beast, or the madman, cannot be held principals, being only the instruments of death. As therefore he must be certainly guilty, either as principal or accessory, and cannot be so as accessory, it follows that he must be guilty as principal; and if principal, then in the first degree; for there is no other criminal, much less a superior in the guilt, whom he could aid, abet, or assist.

PRINCIPAL Point, in perspective, is a point in the perspective plane, upon which a line drawn from the eye, perpendicular to the plane falls.

This point is in the intersection of the horizontal and vertical plane; and is also called the *point of sight*, and *point of the eye*. See PERSPECTIVE.

PRINCIPAL Ray, in perspective, is that which passes perpendicularly from the spectator's eye to the perspective plane, or picture.

Whence the point where this ray falls on the plane, is by some also called the *principal point*, which other writers call the *centre of the picture*, and the *point of concurrence*.

PRINCIPATO, the name of a province of Italy, in the kingdom of Naples, which is divided into two parts, called by the Italians the *Principato Ultra* and the *Principato Citra*, that is, the Hither and Farther Principato. The Hither Principato is bounded on the north by the Farther Principato and part of the Terra-di-Lavoro, on the west and south by the Tuscan Sea, and on the east by the Basilicata. It is about 60 miles in length, and 30 in breadth; the soil is fertile in wine, corn, oil, and saffron; and they have a great deal of silk, besides several mineral springs. The capital town is Salerno. The Farther Principato is bounded on the north by the county of Molese and the Terra-di-Lavoro, on the west by the Tuscan Sea, on the south by the Hither Principato, and on the east by the Capitanata. It is about 37 miles in length, and 30 in breadth. The Appennine mountains render the air cold; and the soil is not very fertile either in corn or wine, but it produces chestnuts, and pastures in great plenty. Benevento is the capital town.

PRINCIPLE, PRINCIPIUM, in general, is used for the cause, source, or origin of any thing.

PRINCIPLE, in human nature. See DISPOSITION.

PRINCIPLE in science, is a truth, admitted without proof, from which other truths are inferred by a chain of reasoning. Principles are of two kinds, *primary* and *general*; and to the last the name of *axioms* is usually given on account of their importance and *dignity*. An axiom or *general* principle, when the terms in which it is expressed are understood, must be a self-evident truth; but from its very nature it cannot be a *first* truth. Our first truths are all *particular*. A child knows that two *particular* lines, each an inch long, are equal to one another, before he has formed any *general* notions of length and equality. "Things equal to one and the same thing are equal to one another," is the first

Principle,
Pringle.

first of Euclid's axioms; and an axiom it undoubtedly is, but to no man has it been a *first* truth. It is, if we may use the expression, a *genus* or *class* of truths comprehending under it numberless individuals. Were a full-grown man introduced into the world, without a single idea in his mind, as we may suppose Adam to have been, he would instantly perceive, upon laying together three pieces of wood each a foot long, that they were all equal in length; and if he were to cut another to the same length with *any one* of them, he would find upon trial, that it was of the same length with them all. After a few simple experiments of this kind, he would, by a law of human thought, infer that all things equal in length or in any other dimension, to any *one* thing, are in that dimension equal to one another.

It was not therefore with such weakness as some have imagined, that Hobbes affirmed those propositions commonly called axioms, not to be primary but secondary principles. A primary principle deserves not the name of an axiom, as it is only a particular truth including in it no other truth. There is not one of Euclid's axioms which has not been the result of induction, though we remember not the time at which the induction was made. That the whole is greater than any of its parts is a general truth which no man of common sense can controvert; but every one discovered that truth by observing that his body was larger than his head, his foot, or his hand; that a mountain is larger than a mole-hill in the middle of it; and that a piece of timber measuring what is called a yard is longer than any one of the divisions marked upon it, and termed inches. The particular observations are made through the senses and treasured up in the memory; and the intellect, by its constitution, compares them together, marks in what they agree and disagree, and thence draws its *axioms* or *general* principles. He, therefore, who should admit the truth of an axiom, and deny the evidence of sense and perception, would act as absurdly as he who accepts payment in a bank-bill, and refuses it in the individual pieces of gold or silver which that bill represents. General axioms are of infinite use in the pursuits of science; but it is not because they create new truths; they only shorten the process in the discovery of such as might be found, with labour, through the medium of particular propositions. See *Campbell's Philosophy of Rhetoric* and *Tatham's Chart and Scale of Truth*.

PRINCIPLES, in Physics, are often confounded with elements, or the first and simplest parts whereof natural bodies are compounded, and into which they are again resolvable by the force of fire.

PRINGLE (Sir John), an eminent physician and philosopher, was a younger son of Sir John Pringle of Stichel, in the shire of Roxburgh, Baronet; took the degree of M. D. at Leyden, 1730; and published there *Dissertatio Inauguralis de Marcore Senili*, 4to. After having been some years professor of moral philosophy at Edinburgh, he was in June 1745 appointed physician to the duke of Cumberland, and physician-general to the hospital of the forces in Flanders, where the earl of Stair appears to have been his patron. In February 1746, Dr Pringle, Dr Armstrong, and Dr Barker, were nominated physicians to the hospital for lame, maimed, and sick soldiers, behind Buckingham-

house; and in April 1749, Dr Pringle was appointed physician in ordinary to the king. In 1750 he published "Observations on the Nature and Cure of Hospital and Gaol Fevers, in a Letter to Dr Mead," 8vo (reprinted in 1755); and in 1752 he favoured the public with the result of his long experience in an admirable treatise under the title of "Observations on the Disorders of the Army in Camp and Garrison," 8vo. On the 14th of April 1752, he married Charlotte, second daughter of Dr Oliver, an eminent physician at Bath. In 1756 he was appointed jointly with Dr Wintringham (now Sir Clifton Wintringham, Bart.) physician to the hospital for the service of the forces of Great Britain. After the accession of his present majesty, Dr Pringle was appointed physician to the queen's household, 1761; physician in ordinary to the queen in 1763, in which year he was admitted of the college of physicians in London; and on the 5th of June 1766, he was advanced to the dignity of a baronet of Great Britain. In 1772 he was elected president of the Royal Society, where his speeches for five successive years, on delivering the prize-medal of Sir Godfrey Copley, gave the greatest satisfaction. Sir John Pringle in 1777 was appointed physician-extraordinary to the king. He was also a fellow of the College of Physicians at Edinburgh, and of the Royal Medical Society at Paris; member of the Royal Academies at Paris, Stockholm, Göttingen, and of the Philosophical Societies at Edinburgh and Haarlem; and continued president of the Royal Society till November 1778; after which period he gradually withdrew from the world, and in 1781 quitted his elegant house in Pall Mall (where he had long distinguished himself as the warm friend and patron of literary men of every nation and profession), and made an excursion to his native country. He returned to London in the latter end of that year; died greatly beloved and respected January 18. 1782; and having no children, was succeeded in estate, and also (agreeably to the limitation of the patent) in title, by his nephew, now Sir James Pringle, Bart. Among this worthy physician's communications to the Royal Society, the following are the principal: 1. "Some Experiments on Substances resisting Putrefaction," Phil. Transf. N° 495, p. 580; and N° 496, p. 525, 550; reprinted, with additions, in Martin's Abridgment, vol. xi. p. 1365. 2. "Account of some Persons seized with the Gaol Fever by working in Newgate, and of the manner by which the Infection was communicated to one entire Family," vol. xlviii. p. 42. At the request of Dr Hales, a copy of this useful paper was inserted in the Gentleman's Magazine, 1753, p. 71, before its appearance in the Transactions. 3. "A remarkable Case of Fragility, Flexibility, and Dissolution of the Bones," ib. p. 297. 4. "Account of the Earthquakes felt at Brussels," vol. xlix. p. 546. 5. "Account of sinking of a River near Pontypool, in Monmouthshire," ib. p. 547. 6. "Account of an Earthquake felt Feb. 18. 1756, along the coast of England, between Margate and Dover," ib. p. 579. 7. "Account of the Earthquake felt at Glasgow and Dumbarton; also of a Shower of Dust falling on a Ship between Shetland and Iceland," ib. p. 509. 8. "Several Accounts of the Fiery Meteor which appeared on Sunday, November 26. 1758, between eight and nine at night," vol. l. p. 218. 9. "Account of the Vir-

Pringle.

Trinos
||
Printing.

tues of Soap in dissolving the Stone, in the Case of the Reverend Mr Matthew Simpson," ib. p. 221. 10. "Account of the Effects of Electricity in Paralytic Cases," ib. p. 481. And see a letter to him on that subject from Professor Winthorp. "Some Account of the Success of the *Vitrum Ceratum Antimonii*," was printed in the Edinburgh Medical Essays, vol. v.

PRINOS, in botany: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 43d order, *Dumose*. The calyx is sexfid; the corolla monopetalous, and rotaceous; the belly hexaspermous.

PRINTER, a person who composes and takes impressions from moveable characters ranged in order, by means of ink, and a press.

PRINTING, the art of taking impressions from characters or figures, moveable and immoveable, on paper, linen, silk, &c. There are three kinds of printing: the one from moveable letters, for books; another from copper-plates, for pictures; and the last from blocks, in which the representation of birds, flowers, &c. are cut, for printing calicoes, linen, &c. The first is called *common* or *letter press* printing; the second, *rolling-press* printing; and the last, *calico*, &c. printing. The principal difference between the three consists in this, that the first is cast in relievo, in distinct pieces; the second engraven in creux; and the third cut in relievo, and generally stamped, by placing the block upon the materials to be printed, and striking upon the back of it.

1
Letter-
press print-
ing.

Of the above branches, LETTER-PRESS PRINTING is the most curious, and deserves the most particular notice: for to it are owing chiefly our deliverance from ignorance and error, the progress of learning, the revival of the sciences, and numberless improvements in arts, which, without this noble invention, would have been either lost to mankind, or confined to the knowledge of a few. "To the art of printing (says an elegant essayist*), it is acknowledged we owe the reformation. It has been justly remarked, that if the books of Luther had been multiplied only by the slow process of the hand-writing, they must have been few, and would have been easily suppressed by the combination of wealth and power: but, poured forth in abundance from the press, they spread over the land with the rapidity of an inundation, which acquires additional force from the efforts used to obstruct its progress. He who undertook to prevent the dispersion of the books once issued from the press, attempted a task no less arduous than the destruction of the hydra. Resistance was vain, and religion was reformed: and we who are chiefly interested in this happy revolution must remember, amidst the praises bestowed on Luther, that his endeavours had been ineffectual, unassisted by the invention of Faustus.

2
Utility of
this art.
* Dr Knox.

3
Good and
evil result-
ing from it.

"How greatly the cause of religion has been promoted by the art, must appear, when it is considered, that it has placed those sacred books in the hand of every individual, which, besides that they were once locked up in a dead language, could not be procured without great difficulty. The numerous comments on them of every kind, which tend to promote piety, and to form the Christian philosopher, would probably never have been composed, and certainly would not have extend-

ed their beneficial influence, if typography had still been unknown. By that art, the light, which is to illuminate a dark world, has been placed in a situation more advantageous to the emission of its rays: but if it has been the means of illustrating the doctrines, and enforcing the practice of religion, it has also, particularly in the present age, struck at the root of piety and moral virtue, by propagating opinions favourable to the sceptic and the voluptuary. It has enabled modern authors, wantonly to gratify their avarice, their vanity, and their misanthropy, in disseminating novel systems subversive of the dignity and happiness of human nature: but though the perversion of the art is lamentably remarkable in those volumes which issue, with offensive profusion, from the vain, the wicked, and the hungry, yet this good results from the evil, that as truth is great and will prevail, she must derive fresh lustre, by displaying the superiority of her strength in the conflict with sophistry.

"Thus the art of printing, in whatever light it is viewed, has deserved respect and attention. From the ingenuity of the contrivance, it has ever excited mechanical curiosity; from its intimate connection with learning, it has justly claimed historical notice; and from its extensive influence on morality, politics, and religion, it is now become a subject of very important speculation.

"But however we may felicitate mankind on the invention, there are perhaps those who wish, that, together with its compatriot art of manufacturing gunpowder, it had not yet been brought to light. Of its effects on literature, they assert, that it has increased the number of books, till they distract rather than improve the mind; and of its malignant influence on morals, they complain, that it has often introduced a false refinement, incompatible with the simplicity of primitive piety and genuine virtue. With respect to its literary ill consequences, it may be said, that though it produces to the world an infinite number of worthless publications, yet true wit and fine composition will still retain their value, and it will be an easy task for critical discernment to select these from the surrounding mass of absurdity: and though, with respect to its moral effects, a regard to truth extorts the confession, that it has diffused immorality and irreligion, divulged with cruel impertinence the secrets of private life, and spread the tale of scandal through an empire; yet these are evils which will either shrink away unobserved in the triumphs of time and truth over falsehood, or which may, at any time, be suppressed by legislative interposition."

4
Its good
effects
overbal-
ance the
bad.

Some writers have ascribed the origin of this art to the East, and affixed a very early period to its invention; particularly P. Jovius, (*Hist. lib. xiv. p. 226. ed. Florent. 1550*), from whom Oforius and many others have embraced the same opinion. But these have evidently confounded the European mode of printing with the *engraved tablets* which to this day are used in China. The invention of these tablets has been ascribed by many writers even to an earlier period than the commencement of the Christian era; but is with more probability assigned, by the very accurate Phil. Couplet, to the year 930. The *Historia Sinenfis* of Abdalla, written in Persic in 1317, speaks of it as an art in very common use. MEERMAN, vol. i. p. 16. 218, 219, vol. ii. p. 186. N. Trigault asserts that the Chinese practised the art of printing

5
History of
the inven-
tion of
printing.

Printing. printing five centuries before. Count Ferre Rezzonico found at Lyons plates with words and names engraven by a Nuremberger 1380.

The honour of having given rise to the European method has been claimed by the cities of *Harlem*, *Mentz*, and *Strassburg*. And to each of these it may be ascribed in a qualified sense, as they made improvements upon one another.

Claim of
Harlem.

I. The first testimony of the inventor is that recorded by Hadrian Junius, in his *Batavia*, p. 253, ed. Lugd. Bat. 1588; which, though it hath been rejected by many, is of undoubted authority. Junius had the relation from two reputable men; Nicolaus Galius (A), who was his schoolmaster; and Quirinius Talefius, his intimate and correspondent. He ascribes it to LAURENTIUS, the son of John (Ædituus, or Custos, of the cathedral at HARLEM, at that time a respectable office), upon the testimony of Cornelius, some time a servant to Laurentius, and afterwards bookbinder to the cathedral, an office which had before been performed by Franciscan friars. His narrative was thus: "That, walking in a wood near the city (as the citizens of opulence use to do), he began at first to cut some letters upon the rind of a beech-tree; which for fancy's sake, being impressed on paper, he printed one or two lines, as a specimen for his grand-children (the sons of his daughter) to follow. This having happily succeeded, he meditated greater things (as he was a man of ingenuity and judgment); and first of all, with his son-in-law Thomas Peter (who, by the way, left three sons, who all attained the consular dignity), invented a more glutinous writing-ink, because he found the common ink sunk and spread; and then formed whole pages of wood, with letters cut upon them; of which sort I have seen some essays, in an anonymous work, printed only on one side, intitled, *Speculum nostræ salutis*; in which it is remarkable, that in the infancy of printing (as nothing is complete at its first invention) the back sides of the pages were pasted together, that they might not by their nakedness betray their deformity. These beechen letters he afterwards changed for leaden ones, and these again for a mixture of tin and lead [*stanneas*] as a less flexible and more solid and durable substance. Of the remains of which types, when they were turned to waste metal, those old wine-pots were cast, that are still preserved in the family-house, which looks into the market-place, inhabited afterwards by his great-grandson Gerard Thomas, a gentleman of reputation; whom I mention for the honour of the family, and who died old a few years since. A new invention never fails to engage curiosity. And when a commodity never before seen excited purchasers, to the advantage of the inventor, the admiration of the art increased, dependents were enlarged, and workmen multiplied;

VOL. XV.

the first calamitous incident! Among these was one John, whether, as we suspect, he had ominously the name of *Faulsus* (B), unfaithful and unlucky to his master, or whether it was really a person of that name, I shall not much inquire; being unwilling to molest the silent shades, who suffer from a consciousness of their past actions in this life. This man, bound by oath to keep the secret of printing, when he thought he had learned the art of joining the letters, the method of casting the types, and other things of that nature, taking the most convenient time that was possible, on Christmas eve, when every one was customarily employed in lustful sacrifices, seizes the collection of types, and all the implements his master had got together, and, with one accomplice, marches off to Amsterdam, thence to Cologne, and at last settled at Mentz, as at an asylum of security, where he might go to work with the tools he had stolen. It is certain, that in a year's time, viz. in 1442, the *Doctrinale* of Alexander Galius, which was a grammar much used at that time, together with the *Tracts* of Peter of Spain, came forth there, from the same types as Laurentius had made use of at Harlem."

Thus far the narrative of Junius, which he had frequently heard from Nicolaus Galius; to whom it was related by Cornelius himself, who lived to a great age, and used to burst into tears upon reflecting on the loss his master had sustained, not only in his subsistence, but in his honour, by the roguery of his servant, his former associate and bedfellow. Cornelius, as appears by the registers of Harlem cathedral, died either in 1515, or the beginning of the following year; so that he might very well give this information to Nicolaus Galius, who was schoolmaster to Hadrian Junius.

Though this circumstance is probable as to the main fact, yet we must set aside the evidence of it in some particulars. 1. The first obvious difficulty is noticed by Scriverius; "that the types are said to be made of the rind of beech, which could not be strong enough to bear the impression of the press:" though this is removed, if, instead of the bark, we substitute a bough of the beech. The idea of the bark, when Junius wrote this, was perhaps strong in his mind, from what Virgil tells us (Ecl. v. 13.) of its being usual to cut words in the bark of a beech; and thence he was easily led to make a wrong application of it here.

Bower and
Nichols's
Origin of
Printing.

2. The letters were at first wooden, and are said to be afterwards exchanged for metal types; from which the wine-pots were formed, remaining in the time of Junius. According to tradition, printing was carried on in the same house long after the time of Laurentius: these pots might therefore be formed from the waste metal of the printing-house, after the use of fusile types became universal.—But Laurentius seems to have carried the art no farther than *separate wooden types*. What is a

3 T

remarkable

(A) Galius seems to be the same who is called *Claes Lottynsz. Gael*, Scabinus Harlemni, as it is in the Fasti of that city, in the years 1531, 1533, and 1535. Quirinius in the same Fasti is called *Mr Quiryn Dirkszoon*. He was many years amanuensis to the great Erasmus, as appears from his epistle, 23d July 1529. tom. iii. Oper. p. 1222. He was afterwards Scabinus in 1537 & seq. and Consul in 1552 & seq. But in the troubles of Holland he was cruelly killed by the Spanish soldiers, May 23. 1573. There are some letters of Hadrian Junius to this Talefius, in the *Epist. ad Juniana*, p. 198.

(B) *John Faust*, or *Fust*, is by many supposed to have derived his name from *faustus*, "happy;" and Dr Faustus seems to carry an air of grandeur in the appellation: but very erroneously. *John Faust*, or *Fust*, is no more than *John Hand*, whence our name *Fist*.

Printing. remarkable confirmation of this, Henry Spiechel, who wrote, in the 16th century, a Dutch poem intitled *Hertspiegel*, expresses himself thus: "Thou first, Laurentius, to supply the defect of wooden tablets, adaptedst wooden types, and afterwards didst connect them with a thread, to imitate writing. A treacherous servant surreptitiously obtained the honour of the discovery. But truth itself, though destitute of common and wide-spread fame; truth, I say, still remains." No mention in the poem of *metal types*; a circumstance which, had he been robbed of such, as well as of *wooden ones*, would scarcely have been passed over in silence.

When Laurentius first devised his rough specimen of the art, can only be guessed at. He died in 1440, after having published the *Speculum Belgicum*, and two editions of *Donatus*, all with different *wooden types*; which it is probable (considering the difficulties he had to encounter, and the many artists whom he must necessarily have had occasion to consult) cost him some years to execute; so that the first essay might be about 1430, which nearly agrees with Petrus Scriverius, who says the invention was about 10 or 12 years before 1440. See LAURENTIUS.

3. What was the specimen he first diverted himself with in cutting, at the distance of three centuries, one would think impossible to be discovered. And yet Joh. Enschedius, a printer, thinks he was so happy as to find it, being an old parchment *Horarium*, printed on both sides, in eight pages, containing the Letters of the Alphabet, the Lord's Prayer, the Apostles Creed, and three short prayers. And Mr Meerman having

shown this to proper artists who were judges of these matters, they gave it as their opinion that it agreed exactly with the description of Junius. It is conformable to the first edition of the Dutch *Speculum Salvationis*, and the fragments of both *Donatus's* of Holland, both which are the works of the same Laurentius, and were preceded by this. In these types, which are certainly moveable, cut, and uneven, there is a rudeness which Mr Meerman has not observed in any other instances. There are no numbers to the pages, no signatures, no *direction-words*, no divisions at the end of the lines; on the contrary, a syllable divided in the middle is seen, thus, *Spiritū*, in p. 8. l. 2, 3. There are neither distinctions nor points, which are seen in the other works of Laurentius; and the letter *i* is not marked with an accent, but with a dot at the top. The lines throughout are uneven. The shape of the pages not always the same; not (as they should be) rectangular, but sometimes rhomb-like, sometimes an *isocèle trapezium*; and the performance seems to be left as a specimen both of his piety, and of his ingenuity in this essay of a new invented art. Mr. Meerman has given an exact engraving of this singular curiosity.

But, whatever else may appear doubtful in the narrative of Junius, it is very clear, that the first essays of the art are to be attributed to Laurentius, who used only *separate wooden types*. See the article LAURENTIUS.

II. Some of Laurentius's types were stolen from him ¹ Claim of by one of his servants (c), *John GEINSFLEICH senior*; Mentz, who fled therewith to MENTZ. Having introduced the

(c) Authors differ as to the person who committed this robbery. It is clear from all accounts that his name was *John*; but what his surname was is the disputed point. Junius, after some hesitation, ascribes it to John Fust; but with injustice: for he was a wealthy man, who assisted the first printers at Mentz with money; and though he afterwards was proprietor of a printing-office, yet he never, as far as appears, performed any part of the business with his own hands, and consequently he could never have been a servant to Laurentius. Nor is the conjecture of Scriverius better founded, which fixes it upon John Gutenberg, who (as appears by authentic testimonies) resided at Straßburg from 1436 to 1444, and during all that period employed much fruitless labour and expence in endeavouring to attain this art. Mr Meerman once thought, "it might be either John Meidenbachius, (who, we are told by Seb. Munster and the author of *Chronographia Moguntinenfis*, was an assistant to the first Mentz printers); or John Peterheimius (who was some time a servant to Fust and Schoeffer, and set up a printing-house at Francfort in 1459): or, lastly, some other person, who, being unable through poverty to carry on the business, discovered it to *Geinsfleisch* at Mentz." But more authentic intelligence afterwards convinced him there were two persons of this name; and that John Geinsfleisch senior† was the dishonest servant, who was born at Mentz, and who in the papers published by Kohlerus, we find there in the year 1441, and not before: for though he was of a good family, yet he was poor, and seems to have been obliged, as well as his brother, to seek his livelihood in a foreign country; and perhaps was content to be under Laurentius, that, when he had learned the art, he might follow it in his own. But, to leave conjecture, we may produce some certain testimonies.

1. It is what Junius himself says, that the person who stole the types did it with a view to set up elsewhere; nor is it likely that he would either make no use of an art he had seen so profitable to Laurentius, or that he would teach it to another and submit to be again a servant.

2. The Lambeth Record (which is printed below, from Mr Atkyns) tells us, that "Mentz gained the art by the brother of one of the workmen of Harlem, who learned it at home of his brother, who after set up for himself at Mentz."—By the strictest examination of the best authorities, it is plain, that by these *two brothers* the two Geinsfleishes must be meant. But as the younger (*Gutenberg*) was never a servant to Laurentius, it must be the senior who carried off the types, and instructed his brother in the art; who first applied himself to the business at Straßburg, and afterwards joined his elder brother, who had in the mean time settled at Mentz.

† He was called *Geinsfleisch* κατ' ἐξοχήν; the other was distinguished by the name of *Gutenberg*. They were both poor; though of a family distinguished by knighthood. They were both married men; and were most probably brothers, as it was not uncommon in that age for two brothers to have the same Christian name. These both appear in a disreputable light. The eldest robbed his master, with many aggravating circumstances. The youngest was remarkably contentious; and, after entering into a contract of marriage with Anna, a noble girl of *The Iron Gate*, refused to marry her till compelled by a judicial decree; and afterwards cared not what became of the lady, but left her behind at Straßburg when he removed to Mentz. He had not only frequent quarrels with his wife; but with *Andrew Drizzen*, *Andrew Heilmann*, and *John Riff*, all of whom were associated with him at Straßburg in his different employments of making of looking glasses, polishing of precious stones, and endeavouring to attain the art of printing; and with these he involved himself in three law-suits. See *Blairman*, vol. i. p. 163, &c. N.

Printing. the art from Harlem into this his native city, he set with all diligence to carry it on; and published, in 1442, *ALEXANDRI GALII Doctrinale*, *PETRI HISPANI Tractatus*; two works, which, being small, best suited his circumstances; and for which, being much used in the schools, he might reasonably expect a profitable sale. They were executed with *wooden types*, cut after the model of those he had stolen.

In 1443 he hired the house *Zum Jungen*; and was assisted with money by FUST, a wealthy person, who in return had a share of the business: and about the same time *John Meidenbachius* was admitted a partner, as were some others whose names are not transmitted to our times; and in 1444 they were joined by GUTENBERG, who for the purpose quitted Strasburg. Wooden types being found not sufficiently durable, and not answering expectation in other respects, the two brothers first invented *cut metal types*. But while these were preparing, which must have been a work of time, several works were printed, both on *wooden separate types* and on *wooden blocks*; which were well adapted to small books of frequent use, such as the *Tabula Alphabetica*, the *Catholicon*, *Donati Grammatica*, and the *Confessionalia*.

From the abovementioned printers in conjunction, after many smaller essays, the Bible was published in 1450, with *large cut metal types* (D). And it is no wonder, considering the immense labour this work cost, that it should be seven or eight years in completing. In this same year the partnership was dissolved, and a new one entered into, in August, between *Fust and Gutenberg*;

Printing. the former supplying the money, the latter skill, for their common benefit. Various difficulties arising, occasioned a law-suit for the money which Fust had advanced; which was determined against Gutenberg. A dissolution of this partnership ensued in 1455; and in 1457 a magnificent edition of the *Psalter* was published by *Fust and Schoeffer*, with a remarkable commendation, in which they assumed to themselves the merit of a new invention, (viz. of *metal types*), *ad inventionem artificiosam imprimendi ac characterizandi*. This book was uncommonly elegant, and in some measure the work of Gutenberg; as it was four years in the press, and came out but 18 months after the partnership was dissolved between him and Fust.

The latter continued in possession of the printing-office: and *Gutenberg*, by the pecuniary assistance of Conrad Humery syndic of Mentz (E), and others, opened another office in the same city; whence appeared, in 1460, without the printer's name, the *Catholicon Jo. de Janua*, with a pompous colophon in praise of its beauty, and ascribing the honour of the invention to the city of Mentz. It was a very handsome book, though inferior to the *Psalter* which had been published in 1457 by Fust and Schoeffer. Both the *Psalter* and *Catholicon* were printed on *cut metal types* (F). It may not be improper to observe here, that as the *Psalter* is the earliest book which is known to have a genuine date, it became a common practice, after that publication, for printers to claim their own performances, by adding their names to them.

III. The progress of the art has been thus traced
3 T 2 through

What is still stronger, two chronologers of Strasburg, the one named *Dan Speklinus*, the other anonymous (in Meerman's *Documenta*, n° LXXXV. LXXXVI.), tells us expressly, that John Geinsfleisch (viz. the senior, whom they distinguished from Gutenberg), having learned the art by being servant to its *first inventor*, carried it by theft into Mentz his native country. They are right in the fact, though mistaken in the application of it; for they make Strasburg the place of the invention, and Mentelius the inventor, from whom the types were stolen. But this is plainly an error: for Geinsfleisch lived at Mentz in 1441, as appears from undoubted testimonies; and could not be a servant to Mentelius, to whom the before mentioned writers ascribe the invention in 1440, though more ancient ones do not attempt to prove that he began to print before 1444 or 1447. Nor will the narrative agree better with Gutenberg, who was an earlier printer than Mentelius; since, among the evidences produced by him in his law-suit, 1439, no Geinsfleisch senior appears, nor any other servant but Laurentius Beildek. The narration therefore of the theft of Geinsfleisch, being spread by various reports through the world, and subsisting in the time of these chronologers, was applied by them (to serve the cause they wrote for) to Strasburg; but serves to confirm the truth, since no writer derives the printing spoils from any other country than Holland or Alsatia. The chronologers have likewise, instead of Fust, called Gutenberg the wealthy man; who, from all circumstances, appears to have been poor. They also call Schoeffer the son-in-law of Mentelius; when it is clear that he married the daughter of Fust.

(D) Many writers have supposed that this was the edition of which some copies were sold in France, by Fust, as manuscripts, for the great price of 500 or 600 crowns, which he afterwards lowered to 60, and at last to less than 40. But it was the second and more expensive edition of 1462, that was thus disposed of, when Fust went to Paris in 1466, and which had cost 4000 florins before the third *quaternion* (or quire of four sheets) was printed. MEERMAN, vol. I. p. 6. 151, 152.

(E) At the death of Gutenberg, Conrad Humery took possession of all his printing materials; and engaged to the archbishop Adolphus, that he never would sell them to any one but a citizen of Mentz. They were, however, soon disposed of to Nicholas Bechtermuntze of Altavilla, who, in 1469, published *Vocabularium Latino-Teutonicum*, which was printed with the same types which had been used in the *Catholicon*. This very curious and scarce *Vocabulary* was shown to Mr Meerman, by Mr Bryant, in the Duke of Marlborough's valuable library at Blenheim. It is in quarto, 35 lines long, contains many extracts from the *Catholicon*, and is called *Ex quo*, from the preface beginning with those words. MEERMAN, vol. II. p. 96.

(F) Gutenberg never used any other than either *wooden* or *cut metal types* till the year 1462. In 1465 he was admitted *inter Aulicos* by the elector Adolphus, with an annual pension; and died in February 1468. His elder brother Geinsfleisch died in 1462. Their epitaphs are printed by Mr Meerman, vol. II. p. 154, 295.

Printing. through its *second* period the invention of *cut metal types*. But the honour of completing the discovery is due to PETER SCHOEFFER (G) de Gernsheim.

8
Invention
of cast
types.

A very clear account of this final completion of the types is preserved by Trithemius (H). *Post hæc inventis successerunt subtiliora, inveneruntque modum fundendi formas omnium Latini alphabeti litterarum, quas ipsi matrices nominabant: ex quibus rursus æneis sive stanneis characteres fundebant, ad omnem pressuram sufficientes, quos prius matribus sculpebant. Et revera sicuti ante xxx ferme annos ex ore Petri Opilionis de Gernsheim, civis Moguntini, qui gener erat primi artis inventoris, audiui, magnam a primo inventicinis sue hæc ars impressoria habuit difficultatem.— Petrus autem memoratus Opilio, tunc famulus postea gener, sicut diximus, inventoris primi, Johannis Fust, homo ingeniosus et prudens, faciliorem modum fundendi characteres excogitavit, et artem, ut nunc est, complevit.*

Another ample testimony in favour of Schoeffer is given by Jo. Frid. Faustus of Aschaffenburg, from papers preserved in his family: "Peter Schoeffer of Gernsheim, perceiving his master Fust's design, and being himself ardently desirous to improve the art, found out (by the good providence of God) the method of cutting (*incidendi*) the characters in a *matrix*, that the letters might easily be singly *cast*, instead of being *cut*. He privately *cut matrices* for the whole alphabet; and when he showed his master the letters cast from these matrices, Fust was so pleased with the contrivance, that he promised Peter to give him his only daughter, Christina, in marriage; a promise which he soon after performed. But there were as many difficulties at first with these letters, as there had been before with *wooden* ones; the metal being too soft to support the force of the impression: but this defect was soon remedied, by mixing the metal with a substance which sufficiently hardened it (1)."

Fust and Schoeffer concealed this new improvement, by administering an oath of secrecy to all whom they intrusted, till the year 1462; when, by the dispersion of their servants into different countries, at the sacking of Mentz by the archbishop Adolphus, the invention was publicly divulged.

The first book printed with these *improved types* was *Durandi Rationale*, in 1459; at which time, however,

they seem to have had only *one size* of *cast* letters, all the larger characters which occur being *cut types*, as appears plainly by an inspection of the book. From this time to 1466, Fust and Schoeffer continued to print a considerable number of books; particularly two famous editions of *Tully's Offices*. In the earliest books, they printed more copies on *vellum* than on *paper*, which was the case both of their *Bibles* and *Tully's Offices*. This, however, was soon inverted; and *paper* introduced for the greatest part of their impressions; a few only being printed on *vellum* for curiosities, and for the purpose of being *illuminated*. How long Fust lived, is uncertain; but in 1471 we find Schoeffer was in partnership with *Conrad Henlis* and a kinsman of his master Fust. He published many books after the death of his father-in-law; the last of which that can be discovered is a third edition of the *Psalter* in 1490, in which the old *cut types* of the first edition were used.

IV. With regard to the claim of STRASBURG: It has been already mentioned, that Gutenberg was engaged in that city in different employments; and, among others, in endeavouring to attain the art of printing. That these endeavours were unsuccessful, is plain from an authentic judicial decree of the senate of Strasburg in 1439, after the death of Andrew Drizehen (K).

But there are many other proofs that Gutenberg and his partners were never able to bring the art to perfection.

1. Wimpfelingius*, the oldest writer in favour of Strasburg, tells us, that Gutenberg was the inventor of "a new art of writing," *ans impressoria*, which might also be called a *divine benefit*, and which he happily completed at Mentz; but does not mention one book of his printing: though he adds, that Mentelius printed many volumes correctly and beautifully, and acquired great wealth; whence we may conclude that he perfected what Gutenberg had in vain essayed.

2. Wimpfelingius, in another book †, tells us, the art of printing was found out by Gutenberg *incomplete*; which implies, not that he practised the art in an imperfect manner (as Laurentius had done at Harlem), but rather that he had not been able to accomplish what he aimed at.

3. Gutenberg, when he left Strasburg in 1444 or this

Printing.

(G) In German, *Schoeffer*; in Latin, *Opilio*; in English, *Shepherd*.—He is supposed by Mr Meerman to have been the first engraver on copperplates.

(H) *Annales Hirsaugiensis*, tom. ii. ad ann. 1450.—As this book was finished in 1514, and Trithemius tells us he had the narrative from Schoeffer himself about 30 years before; this will bring us back to 1484, when Schoeffer must have been advanced in years, and Trithemius about 22 years old, who died in 1516. See *Voss. Hist. Lat. l. i. c. 10. Fabr. Med. & Infim. Æt. l. 9.*

(I) See *Meerman*, vol. I. 9. 183. who copied this testimony from Wolfius, *Monument. Typograph.* vol. i. p. 468. seq.

(K) Their first attempts were made about 1437 with *wooden types*. Mr Meerman is of opinion that Geinsfleisch junior (who was of an enterprising genius, and had already engaged in a variety of projects) gained some little insight into the business by visiting his brother who was employed by Laurentius at Haerleim, but not sufficient to enable him to practise it. It is certain that, at the time of the law-suit in 1439, much money had been expended, without any profit having arisen; and the unfortunate Drizehen, in 1438, on his death-bed, lamented to his confessor, that he had been at great expence, without having been reimbursed a single *obolus*. Nor did Gutenberg (who persisted in his fruitless endeavours) reap any advantage from them; for, when he quitted Strasburg, he was overwhelmed in debt, and under a necessity of selling every thing he was in possession of. [MEERMAN, vol. I. p. 198—202.] All the depositions in the law-suit above-mentioned (with the judicial decree) are printed by Mr Meerman, vol. II. p. 58—88, N.

Printing. the following year, and entered into partnership with Geinsfleisch senior and others, had occasion for his brother's assistance to enable him to complete the art; which shows that his former attempts at Strasburg had been unsuccessful †.

‡ Meerman ut supra. § Annal. Hirfaug. ut supra, et Chron. Spanheim. See Meerman, vol. ii. p. 103. 127. • Chronicon Coloniæ, 1499.

4. These particulars are remarkably confirmed by Trithemius, who tells us, in two different places||, that Gutenberg spent all his substance in quest of this art; and met with such insuperable difficulties, that, in despair, he had nearly given up all hopes of attaining it, till he was assisted by the liberality of Fust, and by his brother's skill, in the city of Mentz.

5. Ulric Zell says * the art was completed at Mentz; but that some books had been published in Holland earlier than in that city. Is it likely that Zell, who was a German, would have omitted to mention Strasburg, if it had preceded Mentz in printing?

There is a little doubt therefore that all Gutenberg's labours at Strasburg amounted to no more than a fruitless attempt, which he was at last under the necessity of relinquishing: and there is no certain proof of a single book having been printed in that city till after the dispersion of the printers in 1462, when Mentellius and Eggeftenius successfully pursued the business.

In fine, the pretensions of *Strasburg* fall evidently to be set aside. And as to the other two cities, *Harlem* and *Mentz*, the disputes between them seem easily cleared up, from the twofold invention of printing above-mentioned: the first with *separate wooden types* at Harlem, by Laurentius, about 1430, and after continued by his family; the other with *METAL types* first cut, and afterwards cast, which were invented at Mentz, but not used in Holland till brought thither by Theodoric Martens at Alost about 1472.

From this period printing made a rapid progress in most of the principal towns of Europe. In 1490, it reached Constantinople; and, according to Mr Palmer, p. 281, &c. it was extended, by the middle of the next century, to Africa and America. It was introduced into Russia about 1560: but, from motives either of policy or superstition, it was speedily suppressed by the ruling powers; and, even under the present enlightened empires, has scarcely emerged from its obscurity.—That it was early practised in the inhospitable regions of Iceland, we have the respectable authority of Mr Bryant: “Arngrim Jonas was born amidst the snows of Iceland; yet as much prejudiced in favour of his country as those who are natives of an happier climate. This is visible in his *Crymogæa*; but more particularly in his *Anatome Blefkiniana*. I have in my possession this curious little treatise, written in Latin by him in his own country, and printed *Typis Holensibus in Islandiâ Boreali*, anno 1612. *Hola* is placed in some maps within the Arctic circle, and is certainly not far removed from it. I believe it is the farthest north of any place where arts and sciences have ever resided.” *Observations and Inquiries relating to various parts of Ancient History*, 1767, p. 277.

10 Introduction of the art into Britain.

It was a constant opinion, delivered down by our historians, as hath been observed by Dr Middleton, that the Art of Printing was introduced and first practised in England by *William Caxton*, a mercer, and citizen of London; who, by his travels abroad, and a residence of many years in Holland, Flanders, and Germany, in the affairs of trade, had an opportunity of informing himself of the whole

method and process of the art; and by the encouragement of the great, and particularly of the abbot of Westminster, first set up a press in that abbey, and began to print books soon after the year 1471.

This was the tradition of our writers; till a book, which had scarce been observed before the Restoration, was then taken notice of by the curious, with a date of its impression from Oxford, anno 1468, and was considered immediately as a clear proof and monument of the exercise of printing in that university several years before Caxton began to deal in it.

This book, which is in the public library at Cambridge, is a small volume of 41 leaves in 4to, with this title; *Expositio Sancti Jeronimi in Symbolum Apostolorum ad Papam Laurentium*: and at the end, *Explicit expositio, &c. Impressa Oxonie, & finita Anno Domini M.CCCC.LXVIII. XVII die Decembris.*

The appearance of this book has robbed Caxton of a glory that he had long possessed, of being the author of printing in England; and Oxford has ever since carried the honour of the first press. The only difficulty was, to account for the silence of history in an event so memorable, and the want of any memorial in the university itself concerning the establishment of a new art amongst them of such use and benefit to learning. But this likewise has been cleared up by the discovery of a record, which had lain obscure and unknown at Lambeth-palace, in the Register of the See of Canterbury; and gives a narrative of the whole transaction, drawn up at the very time.

An account of this record was first published in a thin quarto volume, in English; with this title: “The Original and growth of Printing, collected out of History and the Records of this Kingdom: wherein is also demonstrated, that Printing appertaineth to the Pre-rogative Royal, and is a Flower of the Crown of England. By Richard Atkyns, esq.—Witehall, April the 25, 1664. By order and appointment of the right honourable Mr Secretary Morrice, let this be printed. Tho. Rycaut. London: Printed by John Streater, for the Author. 1654.” 4to.

It sets forth in short, “That as soon as the art of printing made some noise in Europe, Thomas Bourchier, archbishop of Canterbury, moved the then king (Henry VI.) to use all possible means for procuring a printing-mould (for so it was then called) to be brought into this kingdom. The king (a good man, and much given to works of this nature) readily hearkened to the motion; and, taking private advice how to effect his design, concluded it could not be brought about without great secrecy, and a considerable sum of money given to such person or persons as would draw off some of the workmen of Harlem in Holland, where John Gutenberg had newly invented it, and was himself personally at work. It was resolved, that less than 1000 merks would not produce the desired effect; towards which sum the said archbishop presented the king 300 merks. The money being now prepared, the management of the design was committed to Mr Robert Turnour; who then was master of the robes to the king, and a person most in favour with him of any of his condition. Mr Turnour took to his assistance Mr Caxton, a citizen of good abilities, who traded much into Holland; which was a credible pretence, as well for his going, as stay in the Low Countries. Mr Turnour was in disguise

Printing.

†† The first printing-press set up in England was at Oxford.

Printing.

(his beard and hair shaven quite off); but Mr Caxton appeared known and public. They, having received the said sum of 1000 merks, went first to Amsterdam, then to Leyden, not daring to enter Harlem itself; for the town was very jealous, having imprisoned and apprehended divers persons who came from other parts for the same purpose. They staid till they had spent the whole thousand merks in gifts and expences: so as the king was fain to send 500 merks more, Mr Turnour having written to the king that he had almost done his work; a bargain, as he said, being struck betwixt him and two Hollanders, for bringing off one of the underworkmen, whose name was Frederick Corfells (or rather Corfellis), who late one night stole from his fellows in disguise into a vessel prepared before for that purpose; and so, the wind favouring the design, brought him safe to London. It was not thought so prudent to set him on work at London: but, by the archbishop's means (who had been vice-chancellor and afterwards chancellor of the university of Oxon) Corfellis was carried with a guard to Oxon; which guard constantly watched, to prevent Corfellis from any possible escape, till he had made good his promise in teaching them how to print. So that at Oxford printing was first set up in England, which was before there was any printing-press or printer in France, Spain, Italy, or Germany (except the city of Mentz), which claims seniority, as to printing, even of Harlem itself, calling her city, *Urbem Moguntinam artis typographice inventricem primam*; though it is known to be otherwise, that city gaining the art by the brother of one of the workmen of Harlem, who had learnt it at home of his brother, and after set up for himself at Mentz. This press at Oxon was at least ten years before there was any printing in Europe, except at Harlem and Mentz, where it was but new-born. This press at Oxford was afterwards found inconvenient to be the sole printing-place of England; as being too far from London and the sea. Wherefore the king set up a press at St Alban's, and another in the city of Westminster, where they printed several books of *divinity* and *physic*: for the king (for reasons best known to himself and council) permitted then no law-books to be printed; nor did any printer exercise that art, but only such as were the king's sworn servants; the king himself having the price and emolument for printing books.—By this means the art grew so famous, that anno primo Richard III. c. 9. when an act of parliament was made for restraint of aliens for using any handicrafts here (except as servants to natives), a special proviso was inserted, that strangers might bring in printed or written books to sell at their pleasure, and exercise the art of printing here, notwithstanding that act: so that in the space of 40 or 50 years, by the indulgence of Edward IV. Edward V. Richard III. Henry VII. and Henry VIII. the English proved so good proficient in printing, and grew so numerous, as to furnish the kingdom with books; and so skilful, as to print them as well as any beyond the seas; as appears by the act 25 Hen. VIII. c. 15. which abrogates the said proviso for that reason. And it was further enacted in the said statute, that if any person bought foreign books bound, he should pay 6s. 8d. per book. And it was further provided and enacted, that in case the said printers or sellers of books were unreasonnable in their prices, they should be moderated by the lord chancellor, lord treasurer, the two lords

chief justices, or any two of them; who also had power to fine them 3s. 4d. for every book whose price should be enhanced.—But when they were by charter incorporated with *bookbinders*, *booksellers*, and *founders of letters*, 3 & 4 Philip and Mary, and called the *Company of Stationers*—they kick'd against the power that gave them life, &c.—Queen Elizabeth, the first year of her reign, grants by patent the privilege of sole printing all books that touch or concern the common laws of England, to Tottel a servant to her majesty, who kept it entire to his death; after him, to one Yest Weirt, another servant to her majesty; after him, to Weight and Norton; and after them, king James grants the same privilege to More, one of the signet; which grant continues to this day, &c.”

From the authority of this record, all our late writers declare Corfellis to be the first printer in England; Mr Anthony Wood, the learned Mr Maittaire, Palmer, and one John Bagford, an industrious man, who had published proposals for an History of Printing, (Phil. Transf. for April 1707). But Dr Middleton has called in question the authenticity of this account, and has urged several objections to it, with the view of supporting Caxton's title to the precedency with respect to the introduction of the art into this country; of which we shall quote one or two, with the answers that have been made to them.

Objection 1.—“The silence of Caxton concerning a fact in which he is said to be a principal actor, is a sufficient confutation of it: for it was a constant custom with him, in the prefaces or conclusions of his works, to give an historical account of all his labours and transactions, as far as they concerned the publishing and printing of books. And, what is still stronger, in the continuation of the Polychronicon, compiled by himself, and carried down to the end of Henry the sixth's reign, he makes no mention of the expedition in quest of a printer: which he could not have omitted, had it been true; whilst in the same book he takes notice of the invention and beginning of printing in the city of Mentz.”

Answer.—As Caxton makes no mention in his Polychronicon of his expedition in quest of a printer; so neither does he of his bringing the art into England, which it is as much a wonder he should omit as the other. And as to his saying that the invention of printing was at Mentz, he means, of printing on fusile separate types. In this he copies, as many others have, from the *Fasciculus Temporum*; a work written in 1470, by Wernerus Rolevinch de Laer, a Carthusian monk, a MS. copy of which was in the library of Gerard Jo. Vossius (see lib. iii. de Hist. Lat. c. 6.); and afterwards continued to the year 1474, when it was first printed at Cologne *typis Arnoldi ter Huernen*. It was republished in 1481 by Heinricus Wirzburg de Vach, a Cluniac monk, without mentioning the name either of the printer or of the place of publication. It is plain that Caxton had one at least, or more probably both, of these editions before him, when he wrote his continuation of Polychronicon, as he mentions this work in his preface, and adapts the sentiments of its editor. (See MEERMAN, vol ii p. 37. and his *Documenta*, N° VII. XXIV. and XXV.)

Obj. 2. “There is a farther circumstance in Caxton's history, that it seems inconsistent with the record; for we find him still beyond sea, about twelve years after the

Printing.

12

Whether Caxton or Corfellis was the first printer.

Printing. the supposed transactions, "learning with great charge and trouble the art of printing" (*Recule of the Histories of Troye*, in the end of the 2d and 3d books); which he might have done with ease at home, if he had got Corfellis into his hands, as the record imports, so many years before: but he probably learnt it at Cologne, where he resided in 1471, (*Recule*, &c. *ibid.*), and whence books had been first printed with date the year before."

Anf.—Caxton tells us, in the preface to *The History of Troy*, that he began that translation March 1. 1468, at Bruges; that he proceeded on with it at Ghent; that he finished it at Cologne in 1471; and printed it, probably, in that city with his own types. He was 30 years abroad, chiefly in Holland; and lived in the court of Margaret duchess of Burgundy, sister of Edward IV. It was therefore much easier to print his book at Cologne, than to cross the sea to learn the art at Oxford. But further, there was a special occasion for his printing it abroad. Corfellis had brought over so far the art of printing as he had learned it at Harlem, which was the method of printing on *wooden separate* types, having the face of the letter cut upon them. But the art of *casting* metal types being divulged in 1462 by the workmen of Mentz, Caxton thought proper to learn that advantageous branch before he returned to England. This method of casting the types was such an improvement, that they looked on it as the *original* of printing; and Caxton, as most others do, ascribes that to Mentz.—Caxton was an assistant with Turnour in getting off Corfellis; but it is nowhere supposed that he came with him into England. (See MEERMAN, vol. ii. p. 34. B.)

Obj. 3.—"As the Lambeth record was *never heard of before the publication of Atkyn's book*, so it has never since been seen or produced by any man; though the registers of Canterbury have on many occasions been diligently and particularly searched for it. They were examined, without doubt, very carefully by archbishop Parker, for the compiling his *Antiquities of the British Church*; where, in the life of Thomas Bourchier, tho' he congratulates that age on the noble and useful invention of printing, yet he is silent as to the introduction of it into England by the endeavours of that archbishop: nay, his giving the honour of the invention to Straßburg clearly shows that he knew nothing of the story of Corfellis conveyed from Harlem, and that the record was not in being in his time. Palmer himself owns, "That it is not to be found there now; for that the late earl of Pembroke assured him, that he had employed a person for some time to search for it, but in vain:" (*Hist. of Printing*, p. 314.) On these grounds we may pronounce the record to be a forgery; though all the writers abovementioned take pains to support its credit, and call it an *authentic piece*."

Atkyns, who by his manner of writing seems to have been a *bold and vain man*, might possibly be the *inventor*: for he had an interest in imposing it upon the world, in order to confirm the argument of his book, that *printing was of the prerogative royal*; in opposition to the *company of stationers*, with whom he was engaged in an expensive suit of law, in defence of the *king's patents*, under which he claimed *some exclusive powers of printing*. For he tells us, p. 3. "That, upon considering the thing, he could not but think that a public

person, more eminent than a mercer, and a public purse, must needs be concerned in so public a good: and the more he considered, the more inquisitive he was to find out the truth. So that he had formed his hypothesis before he had found his record; which he published, he says, as a friend to truth; not to suffer one man to be intitled to the worthy achievements of another; and as a friend to himself, not to lose one of his best arguments of entitling the king to this art." But, if Atkyns was not himself the contriver, he was imposed upon at least by some more crafty man; who imagined that his interest in the cause, and the warmth that he showed in prosecuting it, would induce him to swallow for genuine whatever was offered of the kind."

Anf.—On the other hand, is it likely that Mr Atkyns would dare to *forge* a record, to be laid before the king and council, and which his adversaries, with whom he was at law, could disprove?—(2.) He says he received this history from a person of honour, who was some time keeper of the Lambeth library. It was easy to have confuted this evidence, if it was false, when he published it, April 25. 1664.—(3.) John Bagford (who was born in England 1651, and might know Mr Atkyns, who died in 1677), in his *History of Printing at Oxford*, blames those who doubted of the authenticity of the Lambeth MS.; and tells us that he knew Sir John Birkenhead had an authentic copy of it, when in 1665 [which Bagford by some mistake calls 1664, and is followed in it by Meerman] he was appointed by the house of commons to draw up a bill relating to the exercise of that art. This is confirmed by the Journals of that house, Friday Oct. 27. 1665. vol. VIII. p. 622. where it is ordered, that this Sir John Birkenhead should carry the bill on that head to the house of lords for their consent.—The act was agreed to in the upper house on Tuesday Oct. 31. and received the royal assent on the same day; immediately after which the parliament was prorogued. See *Journals of the House of Lords*, Vol. XI. p. 700.—Is it probable, then, that after Mr Atkyns had published his book in April 1664, the parliament thought proper, the next year, to inquire into *the right of the king's prerogative*; and that Sir John Birkenhead took care to inspect the original, then in the custody of archbishop Sheldon: and, finding it not sufficient to prove what Mr Atkyns had cited it for, made no report of the MS. to the house; but only moved, that the former law should be renewed. The MS. was probably never returned to the proper keeper of it; but was afterwards burnt in the fire of London, Sept. 13. 1666.—(4.) That printing was practised at Oxford, was a prevailing opinion long before Atkyns. Bryan Twyne, in his *Apologia pro Antiquitate Academiae Oxoniensis*, published 1608, tells us, it is so delivered down in *ancient writings*; having heard, probably, of this Lambeth MS. And king Charles I. in his letters patent to the University of Oxford, March 5. in the eleventh of his reign, 1635, mentions printing as brought to Oxford from abroad. As to what is objected, "that it is not likely that the press should undergo a ten or eleven years sleep, viz. from 1468 to 1479," it is probably urged without foundation. Corfellis might print several books without date or name of the place, as Ulrich Zell did at Cologne, from 1467 to 1473, and from that time to 1494. Corfellis's name, it may be said, appears not in any of his publications; but neither does

Printing.

that

Printing. that of Joannes Petershemius. [See MEERMAN, vol. I. p. 34.; vol. II. p. 21—27, &c.]

Further, the famous Shakespeare, who was born in 1564, and died in 1616, in the Second Part of Henry VI. act iv. sc. 7. introduces the rebel John Cade, thus upbraiding Lord Treasury Say: "Thou hast most traitorously corrupted the youth of the realm, in creating a grammar-school: and whereas, before, our forefathers had no other book but the score and the tally, thou hast caused *Printing* to be used; and, contrary to the king, his crown, and dignity, thou hast built a paper-mill."—Whence now had Shakespeare this accusation against lord Say? We are told in the Poetical Register, vol. II. p. 231. ed. Lond. 1724, that it was from Fabian, Pol. Vergel, Hall, Hollingshed, Grafton, Stow, Speed. &c. But not one of these ascribes printing to the reign of Henry VI. On the contrary, Stow, in his Annals, printed at London 1560, p. 686, gives it expressly to William Caxton, 1471. "The noble science of printing was about this time found out in Germany at Maguace, by one John Guthumburgus a knight. One Conradus an Almaine brought it into Rome: William Caxton of London mercer, brought it into England about the year 1471, and first practised the same in the Abbie of St Peter at Westminster; after which time it was likewise practised in the Abbies of St Augustine at Canterbury, Saint Albons, and other monasteries of England." What then shall we say, that the above is an anachronism arbitrarily put into the mouth of an ignorant fellow out of Shakespeare's head? We might believe so, but that we have the record of Mr Atkins confirming the same in king Charles II.'s time. Shall we say, that Mr Atkins borrowed the story from Shakespeare, and published it with some improvements of money laid out by Henry VI. from whence it might be received by Charles II. as a prerogative of the crown? But this is improbable, since Shakespeare makes Lord Treasurer Say the instrument of importing it, of whom Mr Atkins mentions not a word. Another difference there will still be between Shakespeare and the Lambeth MS.; the poet placing it before 1449, in which year Lord Say was beheaded; the MS. between 1454 and 1459, when Bouchier was archbishop. We must say, then, that lord Say first laid the scheme, and sent some one to Harlem, though without success; but after some years it was attempted happily by Bouchier. And we must conclude, that as the generality of writers have overlooked the invention of printing at Harlem with *wooden* types, and have ascribed it to Mentz where *metal* types were first made use of; so in England they have passed by Corfellis (or the first Oxford Printer, whoever he was, who printed with *wooden* types at Oxford), and only mentioned Caxton as the original artist who printed with *metal* types at Westminster. [See MEERMAN, vol. ii. 7, 8.] It is strange, that the learned commentators on the great dramatic poet, who are so minutely particular upon less important occasions, should every one of them, Dr Johnson excepted, pass by this curious passage, leaving it entirely unnoticed. And how has Dr Johnson trifled, by slightly remarking, "that Shakespeare is a little *too early* with this accusation!"—The great critic had undertaken to decipher obsolete words, and investigate unintelligible phrases; but never, perhaps, bestowed a thought on Caxton or Corfellis, on

Mr Atkins or the authenticity of the Lambeth Record. Printing.

But, independent of the record altogether, the book stands firm as a monument of the exercise of printing in Oxford six years older than any book of Caxton's with a date. In order to get clear of this strong fact Dr Middleton,

1. Supposes the date in question to have been falsified originally by the printer either by design or mistake; and an X to have been dropped or omitted in the age of its impression. Examples of this kind, he says, are common in the history of printing. And, "whilst I am now writing, an unexpected instance is fallen into my hands, to the support of my opinion; an *Inauguration Speech of the Woodwardian Professor, Mr Mason*, just fresh from the press, with its date given 10 years earlier than it should have been, by the omission of an x, viz. MDCXXXIV; and the very blunder exemplified in the last piece printed at Cambridge, which I suppose to have happened in the first from Oxford."—To this it has been very properly answered, That we should not pretend to set aside the authority of a *plain date*, without very strong and cogent reasons; and what the Doctor has in this case advanced will not appear, on examination, to carry that weight with it that he seems to imagine. There may be, and have been, mistakes and forgeries in the date both of books and of records too; but this is never allowed as a reason for suspecting such as bear no mark of either. We cannot from a blunder in the last book printed at Cambridge, infer a like blunder in the first book printed at Oxford. Besides, the *type* used in this our Oxford edition seems to be no small proof of its antiquity. It is the German letter, and very nearly the same with that used by Faust [who has been supposed to be] the first printer; whereas Caxton and Rood use a quite different letter, something between this German and our old English letter, which was soon after introduced by De Worde and Bynson.

2. "For the probability of his opinion (he says), the book itself affords sufficient proof: for, not to insist on what is less material, the *neatness of the letter, and regularity of the page, &c.* above those of Caxton, it has one mark, that seems to have carried the matter beyond probable, and to make it even certain, viz. *the use of signatures*, or letters of the alphabet placed at the bottom of the page, to show the sequel of the pages and leaves of each book; an improvement contrived for the direction of the bookbinders; which yet was not practised or invented at the time when this book is supposed to be printed; for we find no signatures in the books of Faust or Schoeffer at Mentz, nor in the improved or beautiful impressions of John de Spira and Jenson at Venice, till several years later. We have a book in our library, that seems to fix the very time of their invention, at least in Venice; the place where the art itself received the greatest improvements: *Baldi lectura super Codic. Ec.* printed by John de Colonia and Jo. Manthem de Gherretzem anno MCCCCLXXXIII. It is a large and fair volume in folio, *without signatures*, till about the middle of the book, in which they are first introduced, and so continued forward: which makes it probable, that the first thought of them was suggested during the impression; for we have likewise *Lectura Bartholi super Codic. &c.* in two noble and beautiful volumes in folio, printed the

Printing.

the year before at the same place, by Vindelin de Spira, without them: yet from this time forward they are generally found in all the works of the Venetian printers, and from them propagated to the other printers of Europe. They were used at (L) Cologne, in 1475; at Paris, 1476; by Caxton, not before 1480: but if the discovery had been brought into England, and practised at Oxford 12 years before, it is not probable that he would have printed so long at Westminster without them. Mr Palmer indeed tells us, p. 54, 180, that Anthony Zarot was esteemed the inventor of signatures; and that they are found in a Terence printed by him at Milan in the year 1470, in which he first printed. I have not seen that Terence; and can only say, that I have observed the want of them in some later works of this, as well as of other excellent printers of the same place. But, allowing them to be in the Terence, and Zarot the inventor, it confutes the date of our Oxford book as effectually as if they were of later origin at Venice; as I had reason to imagine, from the testimony of all the books that I have hitherto met with."—As to these proofs, first, the neatness of the letter, and the regularity of the page, prove, if any thing, the very reverse of what the Doctor asserts. The art of printing was almost in its infancy brought to perfection; but afterwards debased by later printers, who consulted rather the cheapness than the neatness of their work. Our learned dissertator cannot be unacquainted with the labours of Fust and Jenson. He must know, that though other printers may have printed more correctly, yet scarce any excel them, either in the neatness of the letter, or the regularity of the page. The same may be observed in the English printers. Caxton and Rood were indifferently good printers; de Worde and Pynson were worse; and those that follow them most abominable. This our *anonymous Oxford printer* excels them all; and for this very reason we should judge him to be the most ancient of all. Our dissertator lays great stress on the use of signatures. But no certain conclusion can be drawn either from the use or non-use of these lesser improvements of printing. They have in different places come in use at different times, and have not been continued regularly even at the same places. If Anthony Zarot used them at Milan in 1470, it is certain later printers there did not follow his example; and the like might happen also in England. But, what is more full to our purpose, we have in the Bodleian library an *Æsop's Fables* printed by Caxton. This is, it is believed, the first book which has the *leaves numbered*. But yet this improvement, though more useful than that of the signatures, was disused both by Caxton himself and other later printers in England. It is therefore not at all surprising (if true) that

VOL. XV.

the signatures, though invented by our Oxford printer, might not immediately come into general use. And consequently, this particular carries with it no such certain or effectual confutation as our dissertator boasts of.

3. What the Doctor thinks farther confirms his opinion is, "That, from the time of the pretended date of this book, *anno 1468*, we have no other fruit or production from the press at Oxford for 11 years next following; and it cannot be imagined that a press, established with so much pains and expence, could be suffered to be so long idle and useless."—To this it may be answered, in the words of Oxonides, 1st, That his books may have been lost. Our first printers, in those days of ignorance, met with but small encouragement; they printed but few books, and but few copies of those books. In after-times, when the same books were reprinted more correctly, those first editions, which were not as yet become curiosities, were put to common uses. This is the reason that we have so few remains of the first printers. We have only four books of Theodoric Rood, who seems by his own verses to have been a very celebrated printer. Of John Lettou-William de Machlinia, and the schoolmaster of St Alban's, we have scarce any remains. If this be considered, it will not appear *impossible* that our printer should have followed his business from 1468 to 1479, and yet time have destroyed his intermediate works. But, 2dly, We may account still another way for this distance of time, without altering the date. The Civil Wars broke out in 1469: this might probably oblige our Oxford printer to shut up his press; and both himself and his readers be otherwise engaged. If this were the case, he might not return to his work again till 1479; and the next year, not meeting with that encouragement he deserved, he might remove to some other country with his types.

Dr Middleton concludes with apologising for his "spending so much pains on an argument so inconsiderable, to which he was led by his zeal to do a piece of justice to the memory of our worthy countryman William Caxton; nor suffer him to be robbed of the glory, so clearly due to him, of having *first imported into this kingdom* an art of great use and benefit to mankind: a kind of merit that, in the sense of all nations, gives the best title to true praise, and the best claim to be commemorated with honour to posterity."

The fact, however, against which he contends, but which it seems impossible to overturn, does by no means derogate from the honour of Caxton, who, as has been shown, was the first person in England that practised the art of printing with *fusile types*, and consequently the first who brought it to perfection; whereas Corfellis printed with *separate cut types in wood*, being the only method

3 U

which

23
The real
claims of
Caxton and
Corfellis
respectively.

(L) Dr Middleton is mistaken in the time and place of the invention of signatures. They are to be found even in very ancient MSS. which the earliest printers very studiously imitated; and they were even used in some editions from the office of Lawrence Coster (whence Corfellis came), which consisted of wooden cuts, as in *Figura typica et antitypica Novi Testamenti*; and in some editions with metal types, as in *Gasp. Pergamenus epistola*, published at Paris, without a date, but printed A. D. 1470, (Maittaire *, Annal. vol. i. p. 25.); and in *Mammetretus*, printed by Helias de Llouffen, at Bern in Switzerland, 1470; and in *De Tondeli visione*, at Antwerp, 1472. Venice, therefore, was not the place where they were first introduced.—They began to be used in *Baldus*, it seems, when the book was half finished. The printer of that book might not know, or did not think, of the use of them before. See *Meerman*, vol. ii. p. 18.; and *Phil. Transf.* vol. xxiii. n° 208. p. 1509.

Printing. which he had learned at Harlem. Into this detail, therefore, we have been led, not so much by the importance of the question, as on account of several anecdotes connected with it, which seemed equally calculated to satisfy curiosity and afford entertainment.

Caxton had been bred very reputably in the way of trade, and served an apprenticeship to one Robert Large a mercer; who, after having been sheriff and lord mayor of London, died in the year 1441, and left by will, as may be seen in the prerogative-office, xxiiii merks to his apprentice William Caxton: a considerable legacy in those days, and an early testimonial of his good character and integrity.

From the time of his master's death, he spent the following thirty years beyond sea in the business of merchandise: where, in the year 1464, we find him employed by Edward IV. in a public and honourable negotiation, jointly with one Richard Whitehill, Esq; to transact and conclude a treaty of commerce between the king and his brother-in-law the duke of Burgundy, to whom Flanders belonged. The commission styles them, *ambassadors, procuratores, nuncios, & deputatos speciales*; and gives to both or either of them full powers to treat, &c.

Whoever turns over his printed works, must contract a respect for him, and be convinced that he preserved the same character through life, of an honest, modest, man; greatly industrious to do good to his country, to the best of his abilities, by spreading among the people such books as he thought useful to religion and good manners, which were chiefly translated from the French. The novelty and usefulness of his art recommended him to the special notice and favour of the great; under whose protection, and at whose expence, the greatest part of his works were published. Some of them are addressed to king Edward IV. his brother the duke of Clarence, and their sister the duchess of Burgundy; in whose service and pay he lived many years before he began to print, as he often acknowledges with great gratitude. He printed likewise for the use, and by the express order, of Henry VII. his son prince Arthur, and many of the principal nobility and gentry of that age.

It has been generally asserted and believed, that all his books were printed in the abbey of Westminster; yet we have no assurance of it from himself, nor any mention of the place before the year 1477: so that he had been printing several years without telling us where.

There is no clear account left of Caxton's age: but he was certainly very old, and probably above fourscore, at the time of his death. In the year 1471 he complained of the infirmities of age creeping upon him, and feebling his body: yet he lived 23 years after, and pursued his business, with extraordinary diligence, in the abbey of Westminster, till the year 1494, in which he died; not in the year following, as all who write of him affirm. This appears from some verses at the end of a book, called "Hilton's Scale of Perfection," printed in the same year:

Infynite laud with thankynges many folde
I yield to God me focouryng with his grace
This boke to synfhe which that ye beholde
Scale of Perfection calde in every place

Whereof th' auctor Walter Hilton was
And Wynkyn de Worde this hath sett in print
In William Caxtons hows so fyll the case,
God rest his soule. In joy ther mot it fynt.

Impressus anno salutis mccccxxxxiiii.

Though he had printed for the use of Edward IV. and Henry VII. yet there appears no ground for the notion which Palmer takes up, that the first printers, and particularly Caxton, were sworn servants and printers to the crown; for Caxton, as far as can be observed, gives not the least hint of any such character or title; though it seems to have been instituted not long after his death; for of his two principal workmen, Richard Pynson and Wynkyn de Worde, the one was made printer to the king, the other to the king's mother the Lady Margaret. Pynson gives himself the first title, in *The Imitation of the Life of Christ*; printed by him at the commandment of the Lady Margaret, who had translated the fourth book of it from the French, in the year 1504: and Wynkyn de Worde assumes the second, in *The seven Penitential Psalms*, expounded by Bishop Fisher, and printed in the year 1509. But there is the title of a book given by Palmer, that seems to contradict what is here said of Pynson: viz. *Psalterium ex mandato victoriosissimi Angliæ Regis Henrici Septimi, per Gulielmum Fanque, impressorem regium, anno mdiiii*; which being the only work that has ever been found of this printer, makes it probable that he died in the very year of its impression, and was succeeded immediately by Richard Pynson. No book hath yet been discovered printed in Scotland in this period, though the English printers were able to export some of their works to other countries. See Henry's *History of Great Britain*, vol. v. p. 471.

Before 1465, the uniform character was the old Gothic or German; whence our Black was afterwards formed. But in that year an edition of Lactantius was printed in a kind of Semi-Gothic, of great elegance, and approaching nearly to the present Roman type; which last was first used at Rome in 1467, and soon after brought to great perfection in Italy, particularly by Jenson.

Towards the end of the fifth century, Aldus invented the *Italic* character which is now in use, called, from his name, *Aldine* or *curfious*. This sort of letter he contrived, to prevent the great number of abbreviations that were then in use.

The first essays in Greek that can be discovered are a few sentences which occur in the edition of Tully's *Offices*, 1465, at Mentz; but these were miserably incorrect and barbarous, if we may judge from the specimens Mr Maittaire has given us, of which the following is one:

Οτι κατακαρτηματα και ταπεινω.

In the same year, 1465, was published an edition of Lactantius's *Institutes*, printed in *monasterio Sublacensi*, in the kingdom of Naples, in which the quotations from the Greek authors are printed in a very neat Greek letter. They seem to have had but a very small quantity of Greek types in the monastery; for, in the first part of the work, whenever a long sentence occurred, a blank was left, that it might be written in with a pen: after the middle of the work, however, all the Greek that occurs is printed.

Of the first Greek printing.

The

Printing.

The first printers who settled at Rome were Conrad Sweynheim and Arnold Pannartz, who introduced the present Roman type, in 1466, in Cicero's *Epistole Familiæres*; in 1469 they printed a beautiful edition of *Aulus Gellius*, with the Greek quotations in a fair character, without accents or spirits, and with very few abbreviations.

The first whole book that is yet known is the Greek Grammar of Constantine Lascaris, in quarto, revised by Demetrius Cretensis, and printed by Dionysius Palavivinus, at Milan, 1476. In 1481, the Greek *Psalter* was printed here, with a Latin translation, in folio; as was *Æsop's Fables* in quarto.

Venice soon followed the example of Milan; and in 1486 were published in that city the Greek *Psalter* and the *Batrachomyomachia*, the former by Alexander, and the latter by Laonicus, both natives of Crete. They were printed in a very uncommon character; the latter of them with accents and spirits, and also with *scholia*.

In 1488, however, all former publications in this language were eclipsed by a fine edition of *Homer's Works* at Florence, in folio, printed by Demetrius, a native of Crete. Thus printing (says Mr Maittaire, p. 185.) seems to have attained its acme of perfection, after having exhibited most beautiful specimens of Latin, Greek, and Hebrew.

In 1493, a fine edition of *Isocrates* was printed at Milan, in folio, by Henry German and Sebastian ex Pantremulo.

All the above works are prior in time to those of Aldus, who has been erroneously supposed to be the first Greek printer: the beauty, however, correctness, and number of his editions, place him in a much higher rank than his predecessors; and his characters in general were more elegant than any before used. He was born in 1445, and died in 1515.

Though the noble Greek books of Aldus had raised an universal desire of reviving that tongue, the French were backward in introducing it. The only pieces printed by them were some quotations, so wretchedly performed, that they were rather to be guessed at than read; in a character very rude and uncouth, and without accents. But Francis Tiffard introduced the study of this language at Paris, by his *Βιβλος η γραμματικη*, in 1507; and that branch of printing was afterwards successfully practised by Henry, Robert, and Henry Stephens. See the article STEPHENS.

The earliest edition of the whole Bible was, strictly speaking, the Complutensian Polyglott of Cardinal Ximenes; but as that edition, though finished in 1517, was not published till 1522, the Venetian Septuagint of 1518 may properly be called the first edition of the whole Greek Bible; Erasmus having published the New Testament only at Basil in 1516.

16
Of the first
Hebrew
printing.

A very satisfactory account of Hebrew printing is thus given by Dr Kennicott in his *Annual Accounts of the Collation of Hebrew MSS.* p. 112. "The method which seems to have been originally observed in printing the Hebrew Bible was just what might have been expected: 1. The Pentateuch in 1482. 2. The Prior Prophets, in 1484. 3. The Posterior Prophets, in 1486. 4. The Hagiographa, in 1487. And, after the four great parts had been thus printed separately (each with a comment), the whole text (without a comment) was printed in one volume in 1488; and the text continued

to be printed, as in these first editions, so in several others for 20 or 30 years, without Marginal Keri or Masora, and with greater arguments to the more ancient MSS. till about the year 1520 some of the Jews adopted later MSS. and the Masora; which absurd preference has obtained ever since."

Thus much for the ancient editions given by Jews.

In 1642 a Hebrew Bible was printed at Mantua under the care of the most learned Jews in Italy. This Bible had not been heard of among the Christians in this country, nor perhaps in any other; though the nature of it is very extraordinary. The text indeed is nearly the same with that in other modern editions; but at the bottom of each page are various readings, amounting in the whole to above 2000, and many of them of great consequence, collected from manuscripts, printed editions, copies of the Talmud, and the works of the most renowned Rabbies. And in one of the notes is this remark:—"That in several passages of the Hebrew Bible the differences are so many and so great, that they know not which to fix upon as the true readings."

We cannot quit the subject without observing, on Dr Kennicott's authority, that as the first printed Bibles are more correct than the latter ones; so the variations between the first edition, printed in 1488, and the edition of Vander Hooght, in 1705, at Amsterdam, in 2 vols 8vo, amount, upon the whole, to above 1200! See further *Bowyer and Nichols*, p. 112—117.

When the art of printing was first discovered, they only made use of one side of a leaf: they had not yet found out the expedient of impressing the other. When their editions were intended to be curious, they omitted to print the first letter of a chapter, for which they left a blank space, that it might be painted or illuminated at the option of the purchaser. Several ancient volumes of these early times have been found, where these letters are wanting, as they neglected to have them painted.

When the art of printing was first established, it was the glory of the learned to be correctors of the press to the eminent printers. Physicians, lawyers, and bishops themselves, occupied this department. The printers then added frequently to their names those of the correctors of the press; and editions were then valued according to the abilities of the corrector.

In the productions of early printing may be distinguished the various splendid editions they made of *Primers* or *Prayer-books*. They were embellished with cuts finished in most elegant taste: many of them were ludicrous, and several were obscene. In one of them an angel is represented crowning the Virgin Mary, and God the Father himself assisting at the ceremony. We have seen in a book of natural history the Supreme Being represented as reading on the seventh day, when he rested from all his works. Sometimes St Michael is seen overcoming Satan; and sometimes St Anthony appears attacked by various devils of most hideous forms. The *Prymer of Salisbury*, 1533, is full of cuts: at the bottom of the title page there is the following remarkable prayer:

God be in my Bede,
And in my Understandyng.
God be in my Eyen,
And in my Lokyng.

18
Method of
printing.

The workmen employed in the art of printing are of two kinds: compositors, who range and dispose the letters into words, lines, pages, &c. according to the copy delivered them by the author; and pressmen, who apply ink upon the same, and take off the impression. The types being cast, the compositor distributes each kind by itself among the divisions of two wooden frames, an upper and an under one, called *cases*; each of which is divided into little cells or boxes. Those of the upper case are in number 98: these are all of the same size; and in them are disposed the capitals, small capitals, accented letters, figures, &c. the capitals being placed in alphabetical order. In the cells of the lower case, which are 54, are placed the small letters, with the points, spaces, &c.. The boxes are here of different sizes, the largest being for the letters most used; and these boxes are not in alphabetical order, but the cells which contain the letter ofteneft wanted are nearest the compositor's hand. Each case is placed a little aslope, that the compositor may the more easily reach the upper boxes. The instrument in which the letters are set is called a *composing-stick* (n^o 1.), which consists of a long and narrow plate of brass or iron, &c. on the right side of which arises a ledge, which runs the whole length of the plate, and serves to sustain the letters, the sides of which are to rest against it; along this ledge is a row of holes, which serve for introducing the screw *a* in order to lengthen or shorten the extent of the line, by moving the sliders *b c* farther from or nearer to the shorter ledge at the end *d*. Where marginal notes are required in a work, the two sliding pieces *b c* are opened to a proper distance from each other in such a manner as that while the distance between *d c* forms the length of the line in the text, the distance between the two sliding-pieces forms the length of the lines for the notes on the side of the page. Before the compositor proceeds to compose, he puts a rule or thin slip of brass-plate, cut to the length of the line, and of the same height as the letter, in the composing-stick, against the ledge, for the letter to bear against. Things thus prepared, the compositor having the copy lying before him, and his stick in his left hand, his thumb being over the slider *c*; with the right he takes up the letters, spaces, &c. one by one, and places them against the rule, while he supports them with his left thumb by pressing them to the end of the slider *c*, the other hand being constantly employed in setting in other letters: the whole being performed with a degree of expedition and address not easy to be imagined.

Plate
CCCCXV

A little being thus composed, if it end with a word or syllable, and exactly fill the measure, there needs no farther care; otherwise, more spaces are to be put in, or else the distance lessened, between the several words, in order to make the measure quite full, so that every line may end even. The spaces here used are pieces of metal exactly shaped like the flanks of the letters: they are of various thicknesses, and serve to support the letters, and to preserve a proper distance between the

words; but not reaching so high as the letters, they make no impression when the work is printed. The first line being thus finished the compositor proceeds to the next; in order to which he moves the brass-rule from behind the former, and places it before it, and thus composes another line against it after the same manner as before; going on thus till his stick is full, when he empties all the lines contained in it into the gally.

The compositor then fills and empties his composing-stick as before, till a complete page be formed; when he ties it up with a cord or pack-thread; and setting it by, proceeds to the next, till the number of pages to be contained in a sheet is completed; which done, he carries them to the imposing stone, there to be ranged in order, and fastened together in a frame called a *chase*; and this is termed *imposing*. The chase is a rectangular iron frame, of different dimensions according to the size of the paper to be printed, having two cross-pieces of the same metal, called a *long* and *short cross*, mortised at each end so as to be taken out occasionally. By the different situations of these crosses the chase is fitted for different volumes: for quartos and octavos, one traverses the middle lengthwise, the other broadwise, so as to intersect each other in the centre: for twelves and twenty-fours, the short cross is shifted nearer to one end of the chase; for folios, the long cross is left entirely out, and the short one left in the middle; and for broadsides, both crosses are set aside. To dress the chase, or range and fix the pages therein, the compositor makes use of a set of furniture, consisting of slips of wood of different dimensions, and about half an inch high, that they may be lower than the letters: some of these are placed at the top of the pages, and called *head-sticks*; others between them, to form the inner margin; others on the sides of the crosses, to form the outer margin, where the paper is to be doubled; and others in the form of wedges to the sides and bottoms of the pages. Thus all the pages being placed at their proper distances, and secured from being injured by the chase and furniture placed about them, they are all untied, and fastened together by driving small pieces of wood called *quoins*, cut in the wedge-form, up between the slanting side of the foot and the side sticks and the chase, by means of a piece of hard wood and a mallet; and all being thus bound fast together, so that none of the letters will fall out, it is ready to be committed to the pressmen. In this condition the work is called a *form*; and as there are two of these forms required for every sheet, when both sides are to be printed, it is necessary the distances between the pages in each form should be placed with such exactness, that the impression of the pages in one form shall fall exactly on the back of the pages of the other, which is called *register*.

As it is impossible but that there must be some mistakes in the work, either through the oversight of the compositor, or by the casual transposition of letters in the cases; a sheet is printed off, which is called a *proof*, and given to the corrector; who reading it over, and rectifying it by the copy, making the alterations in the margin, it is delivered back to the compositor to be corrected.

The compositor then unlocking the form upon the correcting-stone, by loosening the quoins or wedges which bound the letters together, rectifies the mistakes

Printing.

Printing.

by picking out the faulty or wrong letters with a slender sharp-pointed steel-bodkin, and putting others into their places. After this another proof is made, sent to the author, and corrected as before; and lastly, there is another proof called a *revise*, which is made in order to see whether all the mistakes marked in the last proof are corrected.

The pressman's business is to work off the forms thus prepared and corrected by the compositor; in doing which there are four things required, paper, ink, balls, and a press. To prepare the paper for use, it is to be first wetted by dipping several sheets together in water: these are afterwards laid in a heap over each other; and to make them take the water equally, they are all pressed close down with a weight at the top. The ink is made of oil and lamp-black; for the manner of preparing which, see *Printing-Ink*. The balls, by which the ink is applied on the forms, are a kind of wooden funnels with handles, the cavities of which are filled with wool or hair, as is also a piece of alum leather or pelt nailed over the cavity, and made extremely soft by soaking in urine and by being well rubbed. One of these the pressman takes in each hand; and applying one of them to the ink-block, daubs and works them together to distribute the ink equally; and then blackens the form which is placed on the press, by beating with the balls upon the face of the letter.

Plate
CCCCXV.

The printing-press, represented n^o 2. is a very curious though complex machine. The body consists of two strong cheeks *aa*, placed perpendicularly, and joined together by four cross-pieces; the cap *b*; the head *c*, which is moveable, being partly sustained by two iron pins or long bolts, that pass the cap; the till or shelf *dd*, by which the spindle and its apparatus are kept in their proper position; and the winter *e*, which bears the carriage, and sustains the effort of the press beneath. The spindle *f* is an upright piece of iron pointed with steel, having a male screw which goes into the female one in the head about four inches. Through the eye *g* of this spindle is fastened the bar *k*, by which the pressman makes the impression. The spindle passes through a hole in the middle of the till; and its point works into a brass pan or nut, supplied with oil, which is fixed to an iron plate let into the top of the platten. The body of the spindle is sustained in the centre of an open frame of polished iron, 1, 1, 2, 2, 3, 3, fixed to it in such a manner as, without obstructing its free play, to keep it in a steady direction; and at the same time to serve for suspending the platten. This frame consists of two parts; the upper called the *garter*, 1, 1; the under, called the *crane*, 2, 2. These are connected together by two short legs or bolts, 3, 3; which being fixed below in the two ends of the crane, pass upward, through two holes in the till, and are received at top into two eyes at the ends of the garter, where they are secured by screws. The carriage *ll* is placed a foot below the platten, having its fore-part supported by a prop called the *fore-stay*, while the other rests on the winter. On this carriage, which sustains the plank, are nailed two long iron bars or ribs; and on the plank are nailed short pieces of iron or steel called *cramp-irons*, equally tempered with the ribs, and which slide upon them when the plank is turned in or out. Under the carriage is fixed a long piece of iron called the *spit*, with a double

wheel in the middle, round which leather-girts are fastened, nailed to each end of the plank: and to the outside of the spit is fixed a rounce *m*, or handle to turn round the wheel. Upon the plank is a square frame or coffin, in which is inclosed a polished stone on which the form *n* is laid; at the end of the coffin are three frames, *viz.* the two tympan and frisket: the tympan *o* are square, and made of three slips of very thin wood, and at the top a piece of iron still thinner; that called the *outer tympan* is fastened with hinges to the coffin: they are both covered with parchment; and between the two are placed blankets, which are necessary to take off the impression of the letters upon the paper. The frisket *p* is a square frame of thin iron, fastened with hinges to the tympan: it is covered with paper cut in the necessary places, that the sheet, which is put between the frisket and the great or outward tympan, may receive the ink, and that nothing may hurt the margins. To regulate the margins, a sheet of paper is fastened upon this tympan, which is called the *tympan sheet*; and on each side is fixed an iron point, which makes two holes in the sheet, which is to be placed on the same points when the impression is to be made on the other side. In preparing the press for working, the parchment which covers the outer tympan is wetted till it is very soft, in order to render the impression more equable; the blankets are then put in, and secured from slipping by the inner tympan: then while one pressman is beating the letter with the balls *q*, covered with ink taken from the ink-block, the other person places a sheet of white paper on the tympan-sheet; turns down the frisket upon it, to keep the paper clean and prevent its slipping; then bringing the tympan upon the form, and turning the rounce, he brings the form with the stone, &c. weighing about 300 lbs. weight, under the platten; pulls with the bar, by which means the platten presses the blankets and paper close upon the letter, whereby half the form is printed; then easing the bar, he draws the form still forward; gives a second pull; and letting go the bar, turns back the form, takes up the tympan and frisket, takes out the printed sheet, and lays on a fresh one; and this is repeated till he has taken off the impression upon the full number of sheets the edition is to consist of. One side of the sheet being thus printed, the form for the other is laid upon the press, and worked off in the same manner.

Chinese PRINTING, is performed from wooden planks or blocks, cut like those used in printing of callico, paper, cards, &c.

Rolling-press PRINTING, is employed in taking off prints or impressions from copperplates engraven, etched, or scraped, as in mezzotintos. See *ENGRAVING*.

This art is said to have been as ancient as the year 1540, and to owe its origin to Finiguerra, a Florentine goldsmith, who pouring some melted brimstone on an engraven plate, found the exact impression of the engraving left in the cold brimstone, marked with black taken out of the strokes by the liquid sulphur: upon this he attempted to do the same on silver plates with wet paper, by rolling it smoothly with a roller; and this succeeded: but this art was not used in England till the reign of king James I. when it was brought from Antwerp by Speed. The form of the rolling-press,

Printing.

Printing. prefs, the composition of the ink used therein, and the manner of applying both in taking off prints, are as follows :

Plate
CCLXXV. The rolling-prefs AL, n° 3. may be divided into two parts, the body and carriage: the body consists of two wooden cheeks PP, placed perpendicularly on a stand or foot LM, which sustains the whole prefs. From the foot likewise are four other perpendicular pieces *c, c, c, c*, joined by other crosses or horizontal ones *d, d, d*, which serve to sustain a smooth even plank or table HIK, about four feet and a half long, two feet and a half broad, and an inch and a half thick. Into the cheeks go two wooden cylinders or rollers, DE, FG, about six inches in diameter, borne up at each end by the cheeks, whose ends, which are lessened to about two inches diameter, and called *trunnions*, turn in the cheeks about two pieces of wood in form of half-moons, lined with polished iron to facilitate the motion. Lastly, to one of the trunnions of the upper roller is fastened a cross, consisting of two levers AB, or pieces of wood, traversing each other, the arms of which crosses serve instead of the bar or handle of the letter-prefs, by turning the upper roller, and when the plank is between the two rollers, giving the same motion to the under one, by drawing the plank forward and backward.

The ink used for copperplates, is a composition made of the stones of peaches and apricots, the bones of sheep and ivory, all well burnt, and called *Frankfort black*, mixed with nut-oil that has been well boiled, and ground together on a marble, after the same manner as painters do their colours.

The method of printing from copperplates is as follows: They take a small quantity of this ink on a rubber made of linen-rags, strongly bound about each other, and therewith smear the whole face of the plate as it lies on a grate over a charcoal fire. The plate being sufficiently inked, they first wipe it over with a foul rag, then with the palm of their left hand, and then with that of the right; and to dry the hand and forward the wiping, they rub it from time to time in whiting. In wiping the plate perfectly clean, yet without taking the ink out of the engraving, the address of the workman consists. The plate thus prepared, is laid on the plank of the prefs; over the plate is laid the paper, first well moistened, to receive the impression; and over the paper two or three folds of flannel. Things thus disposed, the arms of the crosses are pulled, and by that means the plate with its furniture passed through between the rollers, which pinching very strongly, yet equally, presses the moistened paper into the strokes of the engraving, whence it licks out the ink.

PRINTS, the impressions taken from a copperplate. See the last article, and **ENGRAVING**.

From the facility of being multiplied, prints have derived an advantage over paintings by no means inconsiderable. They are found to be more durable; which may, however, in some degree be attributed to the different methods in which they are preserved. Many of the best paintings of the early masters have generally had the misfortune to be either painted on walls, or deposited in large and unfrequented, and consequently damp and destructive, buildings; whilst a print, passing,

at distant intervals, from the *porte feuille* of one collector to that of another, is preserved without any great exertion of its owner: And hence it happens, that whilst the pictures of Raphael have mouldered from their walls, or deserted their canvas, the prints of his friend and contemporary Mark Antonio Raimondi continue in full perfection to this day, and give us a lively idea of the beauties of those paintings, which, without their assistance, had been lost to us for ever; or at least, could have been only known to us, like those of Zeuxis and Apelles, by the descriptions which former writers on these subjects have left us.

Independent of the advantages which prints afford us, when considered as accurate representations of paintings, and imitations of superior productions, they are no less valuable for their positive merit, as immediate representations of nature. For it must be recollected, that the art of engraving has not always been confined to the copying other productions, but has frequently itself aspired to originality, and has, in this light, produced more instances of its excellence than in the other. Albert Durer, Goltzius, and Rembrant, amongst the Dutch and Germans; Parmigiano and Della Bella amongst the Italians, and Callot amongst the French, have published many prints, the subjects of which, there is great reason to suppose, were never painted. These prints may therefore be considered as original pictures of those masters, deficient only in those particulars in which a print must necessarily be inferior to a painting.

The preceding distinction may perhaps throw some light on the proper method of arranging and classing a collection of prints, which has been a matter of no small difficulty. As an art imitating another, the principal should take the lead, and the design, composition, and drawing, in a print, being previous requisites to the manner of execution and finishing; prints engraved after paintings should be arranged under the name of the painter; and every person who looks upon engraving only as auxiliary to painting, will consequently adopt this mode of arrangement. But when engraving is considered as an original art, as imitating nature without the intervention of other methods, then it will certainly be proper to regulate the arrangement according to the names of the engravers.

PRIOR, in general, something before or nearer the beginning than another, to which it is compared.

PRIOR, more particularly denotes the superior of a convent of monks, or the next under the abbot. See **ABBOT**.

Priors are either *claustral* or *conventual*. *Conventual* are the same as abbots. *Claustral* prior, is he who governs the religious of an abbey or priory in *commendam*, having his jurisdiction wholly from the abbot.

Grant PRIOR, is the superior of a large abbey, where several superiors are required.

PRIOR (Matthew), an eminent English poet, was born at London in 1664. His father dying while he was very young, an uncle a vintner, having given him some education at Westminster school, took him home in order to breed him up to his trade. However, at his leisure hours he prosecuted his study of the classics, and especially of his favourite Horace. This introduced

Prior. introduced him to some polite company, who frequented his uncle's house; among whom the earl of Dorset took particular notice of him, and procured him to be sent to St John's college in Cambridge, where, in 1686, he took the degree of A. B. and afterwards became fellow of that college. Upon the revolution, Mr Prior was brought to court by the earl of Dorset; and in 1690 he was made secretary to the earl of Berkeley, plenipotentiary at the Hague; as he was afterward to the ambassador and plenipotentiaries at the treaty of Ryswick in 1697; and the year following to the earl of Portland, ambassador to the court of France. He was in 1697 made secretary of state for Ireland; and in 1700 was appointed one of the lords commissioners of trade and plantations. In 1710, he was supposed to have had a share in writing *The Examiner*. In 1711, he was made one of the commissioners of the customs; and was sent minister plenipotentiary to France, for the negotiating a peace with that kingdom. Soon after the accession of George I. to the throne in 1714, he presented a memorial to the court of France, requiring the demolishing of the canal and new works at Mardyke. The year following he was recalled; and upon his arrival was taken up by a warrant from the house of commons, and strictly examined by a committee of the privy-council. Robert Walpole, Esq; moved the house of commons for an impeachment against him; and Mr Prior was ordered into close custody. In 1717, he was excepted out of the act of grace; however, at the close of that year, he was set at liberty. The remainder of his days he spent in tranquillity and retirement; and died in 1721. His poems are well known, and justly admired. He is said to have written the following epitaph for himself:

"Nobles and heralds, by your leave,
Here lie the bones of Matthew Prior,
The son of Adam and of Eve:
Let Bourbon or Nassau go higher."

Alien PRIORIES, were cells of the religious houses in England which belonged to foreign monasteries: for when manors or tithes were given to foreign convents, the monks, either, to increase their own rule, or rather to have faithful stewards of their revenues, built a small convent there for the reception of such a number as they thought proper, and constituted priors over them.—Within these cells there was the same distinction as in those priories which were cells subordinate to some great abbey; some of these were conventual, and, having priors of their own choosing, thereby became entire societies within themselves, and received the revenues belonging to their several houses for their own use and benefit, paying only the ancient apport (A), acknowledgment, or obvention, at first the surplussage, to the foreign house; but others depended entirely on the foreign houses, who appointed and removed their priors at pleasure. These transmitted all their revenues to the foreign head houses; for which reason their estates were generally seized to carry on the wars between

England and France, and restored to them again on return of peace. These alien priories were most of them founded by such as had foreign abbeys founded by themselves or by some of their family.

The whole number is not exactly ascertained: the Monasticon hath given a list of 100: Weever, p. 338. says 110.

Some of these cells were made indigenous or denizen, or endenized. The alien priories were first seized by Edward I. 1285, on the breaking out of the war between France and England; and it appears from a roll, that Edward II. also seized them, though this is not mentioned by our historians; and to these the act of restitution 1 Ed. III. seems to refer.

In 1337, Edward III. confiscated their estates, and let out the priories themselves with all their lands and tenements, at his pleasure, for 23 years; at the end of which term, peace being concluded between the two nations, he restored their estates 1361, as appears by his letters patent to that of Montacute, county of Somerset, printed at large in Rymer, vol. vi. p. 311. and translated in Weever's *Funeral Monuments*, p. 339. At other times he granted their lands, or lay penions out of them, to divers noblemen. They were also sequestered during Richard II.'s reign, and the head monasteries abroad had the king's licence to sell their lands to other religious houses or to any particular persons who wanted to endow others.

Henry IV. began his reign with showing some favour to the alien priories, restoring all the conventual ones, only reserving to himself in time of war what they paid in time of peace to the foreign abbeys.

They were all dissolved by act of parliament 2 Henry V. and all their estates vested in the crown, except some lands granted to the college of Fotheringhay. The act of dissolution is not printed in the statute books, but it is to be found entire in Rymer's *Fœdera*, IX. 283. and in the Parliament Rolls, vol. iv. p. 22. In general, these lands were appropriated to religious uses. Henry VI. endowed his foundations at Eton in Cambridge with the lands of the alien priories, in pursuance of his father's design to appropriate them all to a noble college at Oxford. Others were granted in fee to the prelates, nobility, or private persons. Such as remained in the crown were granted by Henry VI. 1440, to a bishop Chicheley, &c. and they became part of his and the royal foundations. See *Some Account of Alien-priories*, &c. in two volumes octavo.

PRIORITY, the relation of something considered as prior to another.

PRIORITY, in law, denotes an antiquity of tenure, in comparison of another less ancient.

PRISCIANUS, an eminent grammarian, born at Cæsarea, taught at Constantinople with great reputation about the year 525. Laurentius Valla calls Priscian, Donatus, and Servius, *triumviri in re grammatica*; and thinks none of the ancients who wrote after them fit to be mentioned with them. He composed a work *De arte grammatica*, which was first printed by Aldus at

(A) *Apportus* or *apportagium* (from *portare*), an acknowledgment, oblation, or obvention, to the mother house or church. *Du Cange*.

Priscillia-
nist;
||
Priftis.

at Venice in 1476; and another *De naturalibus questionibus*, which he dedicated to Chosroes king of Persia: beside which, he translated Dionysius's description of the world into Latin verse. A person who writes false Latin, is proverbially said to "break Priscian's head."

PRISCILLIANISTS, in church-history, Christian heretics, so called from their leader Priscillian, a Spaniard by birth, and bishop of Avila. He is said to have practised magic, and to have maintained the principal errors of the Manichees; but his peculiar tenet was, That it is lawful to make false oaths in order to support one's cause and interest.

PRISM, an oblong solid, contained under more than four planes, whose bases are equal, parallel, and alike situated. See OPTICS, n° 142.

PRISON, a goal, or place of confinement.

Lord Coke observes, that a prison is only a place of safe custody, *salva custodia*, not a place of punishment. If this be so, and it cannot be questioned, prisons ought not to be, what they are in most parts of Europe, loathsome dungeons. Any place where a person is confined may be said to be a prison; and when a process is issued against one, he must, when arrested thereon, either be committed to prison, or be bound in a recognizance with sureties, or else give bail, according to the nature of the case, to appear at a certain day in court, there to make answer to what is alleged against him. Where a person is taken and sent to prison, in a civil case, he may be released by the plaintiff in the suit; but if it be for treason or felony, he may not regularly be discharged, until he is indicted of the fact and acquitted. See INDICTMENT, and the next article.

PRISONER, a person restrained or kept in prison upon an action civil or criminal, or upon commendment: and one may be a prisoner on matter of record, or matter of fact. A prisoner upon matter of record, is he who, being present in court, is by the court committed to prison; and the other is one carried to prison upon an arrest, whether it be by the sheriff, constable or other officer.

PRISTIS, the SAWFISH, is generally considered as a species of the *squalus* or *shark* genus, comprehending under it several varieties. Mr Latham, however, is of opinion that it ought to be considered as a distinct genus itself, and that the characteristics of the several varieties are sufficient to constitute them distinct species. According to him therefore the *pristis* is a genus belonging to the order of *amphibia nantes*; and its characters are as follow: A long plane beak or snout, with spines growing like teeth out of both edges; four or five *spiracula*, or breathing apertures, in the sides of the neck: the body is oblong and almost round, with a rough coriaceous skin; the mouth is situated in the lower part of the head; and the nostrils, before the mouth, are half covered with a membranaceous lobe; behind the eyes are two oval holes; the ventral fins approach one another, and in the male are placed about the organs of generation; there are no fins at the anus. Of this genus our author enumerates five species.

1. *Pristis antiquorum*. The head is rather flat at top; the eyes large, with yellow irides; behind each is a hole, which some have supposed may lead to an organ of hearing. The mouth is well furnished with teeth,

but they are blunt, serving rather to bruise its prey than to divide it by cutting. Before the mouth are two foramina, supposed to be the nostrils. The *rostrum*, beak, or snout, is in general about one-third of the total length of the fish, and contains in some 18, in others as far as 23 or 24 spines on each side; these are very stout, much thicker at the back-part, and channelled, inclining to an edge forwards. The fins are seven in number—viz. two dorsal, placed at some distance from each other—two pectoral, taking rise just behind the breathing-holes, which are five in number—two ventral, situated almost underneath the first dorsal—and lastly the caudal, occupying the tail both above and beneath, but longest on the upper part. The general colour of the body is a dull grey, or brownish, growing paler as it approaches the belly, where it is nearly white.

2. *Pectinatus*, which, with the former species, grows to the largest size of any that have yet come under the inspection of the naturalist, some specimens measuring 15 feet in length. The *pectinatus* differs from the *pristis antiquorum*, in having the snout more narrow in proportion at the base, and the whole of it more slender in all its parts; whereas the first is very broad at the base, and tapers considerably from thence to the point. The spines on each side also are longer and more slender, and vary from 25 to 34 in the different specimens: we have indeed been informed of one which contained no less than 36 spines on each side of the snout; but we must confess that we have never been fortunate enough to have seen such a specimen.

3. *Cuspidatus*, of which our author has seen only two specimens, the one about a foot and a half in length, and the other more than two feet and a half. In both of these were 28 spines on each side; but the distinguishing feature is in the spines themselves, being particularly flat and broad, and shaped at the point more like the lancet used by surgeons in bleeding, than any other figure. We believe that no other author has hitherto taken notice of this species.

4. *Microdon*, of which the total length is 28 inches, the snout occupying 10; from the base of this to that of the pectoral fins four inches; between the pectoral and ventral fins six. The two dorsal fins occupy nearly the same proportions in respect to each other; but the hinder one is the smallest, and all of them are greatly hollowed out at the back-part, much more so than in the two first species. The snout differs from that of every other, in several particulars: it is longer in proportion, being more than one-third of the whole fish. The spines do not stand out from the sides more than a quarter of an inch, and from this circumstance seem far less capable of doing injury than any other species yet known.

5. *Cirratus*, of which, continues our author, we have only met with one specimen, which was brought from Port Jackson in New Holland. It is a male, and the total length about 40 inches: the snout, from the tip of it to the eye, 11: the spines widely different from any of the others; they are indeed placed, as usual, on the edge, but are continued on each side even beyond the eyes. The longer ones are slender, sharp, somewhat bent, and about 20 in number; and between these are others not half the length of the primal ones, between some three or four, between others as far as six; and in general the middle one of these smaller series is the longest: beside these a

Priftis.

series

Privateers
||
Privative.

series of minute ones may be perceived beneath, at the very edge. In the snout likewise another singularity occurs:—about the middle of it, on each side, near the edge, arises a flexible, ligamentous cord, about three inches and a half in length, appearing not unlike the beards at the mouth of some of the gadus or cod genus, and no doubt as pliant in the recent state. The colour of the fish is a pale brown: the breathing apertures four in number: the mouth furnished with five rows of minute, but very sharp teeth. See Plate CCCCXVI. where the snout marked 1 is that of the *pristis antiquorum*; that marked 2, of *pectinatus*; and that marked 4, of *microdon*: the entire fish is the *cirratus*.

PRIVATEERS, are a kind of private men of war, the persons concerned wherein administer at their own costs a part of a war, by fitting out these ships of force, and providing them with all military stores; and they have, instead of pay, leave to keep what they take from the enemy, allowing the admiral his share, &c.

Privateers may not attempt any thing against the laws of nations; as to assault an enemy in a port or haven, under the protection of any prince or republic, whether he be friend, ally, or neuter; for the peace of such places must be inviolably kept: therefore, by a treaty made by King William and the States of Holland, before a commission shall be granted to any privateer, the commander is to give security, if the ship be not above 150 tons, in L. 1500, and if the ship exceeds that burden, in L. 3000, that they will make satisfaction for all damages which they shall commit in their courses at sea, contrary to the treaties with that state, on pain of forfeiting their commissions; and the ship is made liable.

Jacob's
Law Dict.

Besides these private commissions, there are special commissions for privateers, granted to commanders of ships, &c. who take pay; who are under a marine discipline; and if they do not obey their orders, may be punished with death: and the wars in later ages have given occasion to princes to issue these commissions, to annoy the enemies in their commerce, and hinder such supplies as might strengthen them or lengthen out the war; and likewise to prevent the separation of ships of greater force from their fleets or squadrons.

Ships taken by British privateers were to be divided into five parts; four parts whereof to go to the persons interested in the privateer, and the fifth to his Majesty: and as a farther encouragement, privateers, &c. destroying any French man of war or privateer, shall receive, for every piece of ordnance in the ship so taken, L. 10 reward, &c.

By a particular statute lately made, the lord admiral, or commissioners of the admiralty, may grant commissions to commanders of privateers, for taking ships, &c. which being adjudged prize, and the tenth part paid to the admiral, &c. wholly belong to the owners of the privateers and the captors, in proportions agreed on between themselves.

PRIVATION, in a general sense, denotes the absence or want of something; in which sense darkness is only the privation of light.

PRIVATIVE, in grammar, a particle, which, prefixed to a word, changes it into a contrary sense. Thus,

VOL. XV.

among the Greeks, the α is used as a primitive; as in *a-theos*, *atheist*, *acephalus*, &c.—The Latins have their primitive *in*; as *in corrigibilis*, *indeclinabilis*, &c.—The English, French, &c. on occasion borrow both the Latin and Greek privatives.

PRIVERNUM, (Livy, Virgil); a town of the Volsci, in Latium, to the east of Setia. *Privernates*, the people. Whose ambassadors being asked, What punishment they deserved for their revolt? answered, What those deserve who deem themselves worthy of liberty. And again, being asked by the Roman consul, should the punishment be remitted, What peace was to be expected with them? If you grant a good peace, you may hope to have it sincere and lasting; but if a bad one, you may well expect it of short continuance. At which answer, the Romans were so far from being displeased, that by a vote of the people they had the freedom of the city granted them. *Privernas*, *atis*, the epithet. The town is now called *Piperno Vecchio*, situated in the Campania of Rome. E. Long. 10. 0. N. Lat. 41. 30.

PRIVET, in botany. See *LIGUSTRUM*.

PRIVILEGE, in law, some peculiar benefit granted to certain persons or places, contrary to the usual course of the law.

Privileges are said to be *personal* or *real*.

Personal privileges are such as are extended to peers, ambassadors, members of parliament, and of the convocation, &c. See *LORDS*, *AMBASSADOR*, *PARLIAMENT*, *ARREST*, &c.

A *real* privilege is that granted to some particular place; as the king's palace, the courts at Westminster, the universities, &c.

PRIVILEGES of the Clergy. See *CLERGY*.

PRIVY, in law, is a partaker, or person having an interest, in any action or thing. In this sense they say, privies in blood: every heir in tail is privy to recover the land intailed. In old law-books, merchants privy are opposed to merchants strangers. Coke mentions four kinds of privies. Privies in blood, as the heir to his father; privies in representation, as executors and administrators to the deceased; privies in estate, as he in reversion, and he in remainder; donor and donee; lessor and lessee: lastly, privy in tenure, as the lord by escheat; *i. e.* when land escheats to the lord for want of heirs.

Privy-Council. See *COUNCIL*. The king's will is the sole constituent of a privy-counsellor; and it also regulates their number, which in ancient times was about twelve. Afterwards it increased to so large a number, that it was found inconvenient for secrecy and dispatch; and therefore Charles II. in 1679, limited it to 30; whereof 15 were principal officers of state, and to be counsellors *ex officio*; and the other 15 were composed of 10 lords and five commoners of the king's choosing. Since that time however the number has been much augmented, and now continues indefinite. At the same time also, the ancient office of lord president of the council was revived, in the person of Anthony earl of Shaftesbury. Privy-counsellors are made by the king's nomination, without either patent or grant; and, on taking the necessary oaths, they become immediately privy-counsellors during the life of the king that chooses them, but subject to removal at his discretion.

Privernum
||
Privy.

Privy.

Any natural born subject of England is capable of being a member of the privy-council; taking the proper oaths for security of the government, and the test for security of the church. By the act of settlement, 12 and 13 W. III. cap. 2. it is enacted, that no person born out of the dominions of the crown of England, unless born of English parents, even though naturalized by parliament, shall be capable of being of the privy-council. The duty of a privy-counsellor appears from the oath of office, which consists of seven articles.

1. To advise the king according to the best of his cunning and discretion. 2. To advise for the king's honour and good of the public, without partiality, through affection, love, meed, doubt, or dread. 3. To keep the king's counsel secret. 4. To avoid corruption. 5. To help and strengthen the execution of what shall be there resolved. 6. To withstand all persons who would attempt the contrary. And, lastly, in general, 7. To observe, keep, and do all that a good and true counsellor ought to do to his sovereign lord.

The privy-council is the *primum mobile* of the state, and that which gives the motion and direction to all the inferior parts. It is likewise a court of justice of great antiquity; the primitive and ordinary way of government in England being by the king and privy-council. It has been frequently used by all their kings for determining controversies of great importance: the ordinary judges have sometimes declined giving judgment till they had consulted the king and privy-council; and the parliament have frequently referred matters of high moment to the same, as being by long experience better able to judge of, and, by their secrecy and expedition, to transact some state affairs, than the lords and commons. At present, the privy-council takes cognizance of few or no matters except such as cannot well be determined by the known laws and ordinary courts; such as matters of complaint and sudden emergencies: their constant business being to consult for the public good in affairs of state. This power of the privy-council is to inquire into all offences against the government, and to commit the offenders to safe custody, in order to take their trial in some of the courts of law. But their jurisdiction herein is only to inquire, and not to punish; and the persons committed by them are intitled to their *habeas corpus* by statute 16 Car. I. cap. 10. as much as if committed by an ordinary justice of the peace.

In plantation or admiralty causes, which arise out of the jurisdiction of the kingdom, and in matters of lunacy and idiocy, the privy-council has cognizance, even in questions of extensive property, being the court of appeal in such causes; or, rather, the appeal lies to the king's majesty himself in council. From all the dominions of the crown, excepting Great Britain and Ireland, an appellate jurisdiction (in the last resort) is vested in this tribunal; which usually exercises its judicial authority in a committee of the whole privy council, who hear the allegations and proofs, and make their report to his majesty in council, by whom the judgment is finally given.

Anciently, to strike in the house of a privy-counsellor, or elsewhere in his presence, was grievously punished: by 3 Hen. VII. cap. 14. if any of the king's servants of his household conspire or imagine to take away the life of a privy-counsellor, it is felony, though

nothing shall be done upon it; and by 9 Ann. cap. 16. it is enacted, that any persons who shall unlawfully attempt to kill, or shall unlawfully assault, and strike, or wound, any privy-counsellor in the execution of his office, shall be felons, and suffer death as such. With advice of this council, the king issues proclamations that bind the subject, provided they be not contrary to law. In debates, the lowest delivers his opinion first, the king last; and thereby determines the matter. A council is never held without the presence of a secretary of state.

The dissolution of the privy-council depends upon the king's pleasure; and he may, whenever he thinks proper, discharge any particular member, or the whole of it, and appoint another. By the common law also it was dissolved *ipso facto* by the king's demise, or deriving all its authority from him. But now, to prevent the inconveniences of having no council in being at the accession of a new prince, it is enacted, by 6 Ann. cap. 7. that the privy-council shall continue for six months after the demise of the crown, unless sooner determined by the successor. *Blackst. Com.* book i. p. 229, &c.

The officers of the privy-council are four clerks of the council in ordinary, three clerks extraordinary, a keeper of the records, and two keepers of the council-chamber. See *PRESIDENT*.

Privy Seal, a seal which the king uses previously to such grants, &c. as are afterwards to pass the great seal.

The privy seal is also sometimes used in matters of less consequence, which do not require the great seal.

Lord Privy Seal. See *KEEPER of the Privy Seal*.

Clerks of the Privy Seal. See *CLERK*.

Privy Chamber. See *CHAMBER*.

PRIZE, or *PRISE*, in maritime affairs, a vessel taken at sea from the enemies of a state, or from pirates; and that either by a man of war, a privateer, &c. having a commission for that purpose.

Vessels are looked on as prize, if they fight under any other standard than that of the state from which they have their commission; if they have no charter-party, invoice, or bill of lading aboard; if loaded with effects belonging to the king's enemies, or with contraband goods.

In British ships of war, the prizes are to be divided among the officers, seamen, &c. as his majesty shall appoint by proclamation; but among privateers, the division is according to the agreement between the owners.

By stat. 13. Geo. II. c. 4. judges and officers, failing of their duty in respect to the condemnation of prizes, forfeit L. 500, with full costs of suit; one moiety to the king, and the other to the informer.

PROA, *FLYING*, in navigation, is a name given to a vessel used in the south seas, because with a brisk trade-wind it sails near 20 miles an hour. In the construction of the proa, the head and stern are exactly alike, but the sides are very different; the side intended to be always the lee-side being flat; and the windward side made rounding, in the manner of other vessels; and, to prevent her over-setting, which from her small breadth, and the straight run of her leeward side, would, without this precaution, infallibly happen, there is a frame laid out to her from windward, to the end of which is fastened a log, fashioned into the shape of a small boat, and made hollow. The weight of the frame

lity.

frame is intended to balance the proa, and the small boat is by its buoyancy (as it is always in the water) to prevent her overletting to windward; and this frame is usually called an outrigger. The body of the vessel is made of two pieces joined endwise, and sewed together with bark, for there is no iron used about her; she is about two inches thick at the bottom, which, at the gunwale, is reduced to less than one. The sail is made of matting, and the mast, yard, boom, and outriggers, are all made of bamboo. See *Anson's Voyage*, quarto, p. 341.

PROBABILITY is a word of nearly the same import with likelihood. It denotes the appearance of truth, or that evidence arising from the preponderation of argument which produces opinion. (See OPINION.) Locke classes all arguments under the heads of *demonstrative* and *probable*: Hume with greater accuracy divides them into *demonstrations*, *proofs*, and *probabilities*. Demonstration produces *science*; proof, *belief*; and probability, *opinion*.

Hardly any thing is susceptible of strict demonstration besides the mathematical sciences, and a few propositions in metaphysical theology. Physics rest upon principles capable, some of them, of complete proof by experience, and others of nothing more than probability by analogical reasoning. What has *uniformly* happened, we expect with the fullest confidence to happen again in similar circumstances; what has *frequently* happened, we likewise expect to happen again; but our expectation is not confident. Uniform experience is proof; frequent experience is probability. The strongest man has *always* been able to lift the greatest weight; and therefore, knowing that one man is stronger than another, we expect, with confidence, that the former will lift more than the latter. The best disciplined army has *generally* proved victorious, when all other circumstance were equal. We therefore expect that an army of veterans will, upon fair ground, defeat an equal number of new levied troops; but as sudden panics have sometimes seized the oldest soldiers, this expectation is accompanied with doubt, and the utmost that we can say of the expected event is, that it is *probable*; whereas in the competitions between the two men, we look upon it as *morally certain*. (See METAPHYSICS, part I. chap. vii. sec. 3.) When two or three persons of known veracity attest the same thing as consistent with their knowledge, their testimony amounts to *proof*, if not contradicted by the testimony of others; if contradicted, it can, at the utmost, amount only to probability. In common language we talk of *circumstantial* proofs and *presumptive* proofs; but the expressions are improper, for such evidence amounts to nothing more than probability. Of probability there are indeed various degrees from the confines of certainty down to the confines of impossibility; and a variety of circumstances tending to the same point, though they amount not to what, in strictness of language, should be called *proof*, afford to the mind a very high degree of evidence, upon which, with the addition of one direct testimony, the laws of many countries take away the life of a man.

PROBABILITY of an Event, in the *Doctrine of Chances*, is greater or less according to the number of chances by which it may happen or fail. (See EXPECTATION). The *probability of life* is liable to the rules of computation. In the *Encyclopédie Methodique*, we find a table of the

probabilities of the duration of life, constructed from that which is to be found in the seventh volume of the *Supplément à l'Histoire de M. de Buffon*; of which the following is an abridgement.

Of 23,994 children born at the same time, there will probably die

$\frac{1}{3}$	In one year	-	7998
$\frac{2}{3}$	Remaining $\frac{2}{3}$ or 15996		
$\frac{1}{2}$	In eight years	-	11997
$\frac{1}{2}$	Remaining $\frac{1}{2}$ or 11997		
$\frac{1}{3}$	In thirty eight years	-	15996
$\frac{1}{3}$	Remaining $\frac{1}{3}$ or 7998		
$\frac{1}{4}$	In fifty years	-	17994
$\frac{1}{4}$	Remaining $\frac{1}{4}$ or 5998		
$\frac{1}{5}$	In sixty one years	-	19995
$\frac{1}{5}$	Remaining $\frac{1}{5}$ or 3999		
$\frac{1}{6}$	In seventy years	-	21595
$\frac{1}{6}$	Remaining $\frac{1}{6}$ or 2399		
$\frac{1}{7}$	In eighty years	-	22395
$\frac{1}{7}$	Remaining $\frac{1}{7}$ or 599		
$\frac{1}{8}$	In ninety years	-	23914
$\frac{1}{8}$	Remaining $\frac{1}{8}$ or 80		
	In an hundred years	-	23992
	Remaining $\frac{1}{8888}$ or 2.		See <i>Bills of Mortality</i>

LIT.

PROBATE of a will or testament, in law, is the exhibiting and proving of last wills and testaments before the officer delegated by the government of the place where the party died.

PROBATION, in the universities, is the examination and trial of a student who is about to take his degrees.

PROBATION, in a monastic sense, signifies the year of a novitiate, which a religious must pass in a convent, to prove his virtue and vocation, and whether he can bear the severities of the rule.

PROBATION, in Scots law. See LAW, p. 714.

PROBATIONER, in the church of Scotland, a student in divinity, who bringing a certificate from a professor in an university of his good morals, and his having performed his exercises to approbation, is admitted to undergo several trials; and, upon his acquitting himself properly in these, receives a licence to preach.

PROBATUM EST (*It is proved*), a term frequently subjoined to a receipt for the cure of some disease.

PROBE, a surgeon's instrument for examining the circumstances of wounds, ulcers, and other cavities, searching for stones in the bladder, &c.

PROBITY means honesty, sincerity, or veracity; and consists in the habit of actions useful to society, and in the constant observance of the laws which justice and conscience impose on us. The man who obeys all the laws of society, with an exact punctuality is not therefore a man of probity; laws can only respect the external and definite parts of human conduct, but probity respects our more private actions, and such as it is impossible in all cases to define; and it appears to be in morals what charity is in religion. Probity teaches us to perform in society those actions which no external power can oblige us to perform, and is that quality in the human mind from which we claim the performance of the *rights* commonly called *imperfect*. See MORAL PHILOSOPHY.

Probate
||
Probity.

Problem **PROBLEM**, in logic, is a proposition that neither appears absolutely true nor false; and, consequently, may be asserted either in the affirmative or negative. **Procellaria**

PROBLEM, in geometry, is a proposition, wherein some operation or construction is required; as to divide a line or angle, erect or let fall perpendiculars, &c. See **GEOMETRY**.

PROBOSCIS, in natural history, is the trunk or snout of an elephant, and some other animals and insects.

Flies, gnats, &c. are furnished with a proboscis or trunk; by means of which they suck the blood of animals, the juice of vegetables, &c. for their food.

PROBUS (Marcus Aurelius), from the son of a gardener, became, by his great valour as a soldier, and his eminent virtues, emperor of Rome, to which dignity he was raised by the army. After having subdued the barbarous nations that had made incursions into different parts of the empire, where they committed horrid cruelties, and governed with great wisdom and clemency, he was massacred in the 7th year of his reign, by some soldiers who were weary of the public works at which he made them labour, in 282.

POCATARCTIC CAUSE, in medicine, the pre-existing, or predisposing cause or occasion of a disease.

PROCELEUSMATICUS, in the ancient poetry, a foot consisting of four short syllables, or two pyrrhichiuses; as *hominibus*.

PROCELLARIA, in ornithology; a genus of birds, belonging to the order of anseres. The beak is somewhat compressed, and without teeth; the mandibles are equal, the superior one being crooked at the point; the feet are palmated, the hind claw being sessile, without any toe. Mr Latham (See his *Index Ornithologicus*, p. 820.) enumerates 24 species, which are principally distinguished by their colour. The most remarkable are,

1. The cinerea, or petrel. The size of this bird is rather superior to that of the common gull: the bill very strong, much hooked at the end, and of a yellow colour. The nostrils are composed of two large tubes, lodged in one sheath: the head, neck, whole under side of the body, and tail, are white: the back and coverts of the wings ash-coloured: the quill-feathers dusky: and the legs yellowish. In lieu of a back toe, it has only a sort of spur, or sharp straight nail. These birds feed on the blubber or fat of whales, &c. which being soon convertible into oil, supplies them constantly with means of defence, as well as provision for their young, which they cast up into their mouths. They are likewise said to feed on sorrel, which they use to qualify the unctuous diet they live on. This species inhabits the isle of St Kilda; makes its appearance there in November, and continues the whole year, except September and October; it lays a large, white, and very brittle egg; and the young are hatched the middle of June. No bird is of such use to the islanders as this: the fulmar supplies them with oil for their lamps, down for their beds, a delicacy for their tables, a balm for their wounds, and a medicine for their distempers. The fulmar is also a certain prognosticator of the change of the wind: if it comes to land, no west wind is expected for some time; and the contrary when it returns and keeps the sea. The whole genus of petrels have a peculiar faculty of spouting from their bills, to a considerable distance,

a large quantity of pure oil; which they do, by way of defence, into the face of any one that attempts to take them: so that they are, for the sake of this panacea, seized by surprise; as this oil is subservient to the above-mentioned medical purposes. Martin tells us, it has been used in London and Edinburgh with success in rheumatic cases. Frederick Martens, who had opportunity of seeing vast numbers of these birds at Spitzbergen, observes, that they are very bold, and resort after the whale-fishers in great flocks; and that, when a whale is taken, they will, in spite of all endeavours, light on it and pick out large lumps of fat, even when the animal is alive: That the whales are often discovered at sea by the multitudes of them flying; and that when one of the former are wounded, prodigious multitudes immediately follow its bloody track. He adds, that it is a most gluttonous bird, eating till it is forced to disgorge itself.

2. The puffinus, or shear-water, is 15 inches in length; the breadth 31; the weight 17 ounces: the bill is an inch and three quarters long; nostrils tubular, but not very prominent: the head, and whole upper side of the body, wings, tail, and thighs, are of a sooty blackness; the under side from chin to tail, and inner coverts of the wings, white: the legs weak, and compressed sidewise; dusky behind, whitish before. These birds are found in the Calf of Man; and, as Mr Ray supposes, in the Scilly isles. They resort to the former in February; take a short possession of the rabbit-burrows, and then disappear till April. They lay one egg, white and blunt at each end; and the young are fit to be taken the beginning of August; when great numbers are killed by the person who farms the isle: they are salted and barrelled; and when they are boiled, are beaten with potatoes. During the day they keep at sea, fishing; and towards evening return to their young; whom they feed, by discharging the contents of their stomachs into their mouths; which by that time is turned into oil: by reason of the backward situation of their legs, they sit quite erect. They quit the isle the latter end of August, or beginning of September; and, from accounts lately received from navigators, we have reason to imagine that like the storm-finch, they are dispersed over the whole Atlantic ocean. This species inhabits also the Orkney isles, where it makes its nest in holes on the earth near the shelves of the rocks and headlands: it is called there the *lyre*; and is much valued, both on account of its being a food, and for its feathers. The inhabitants take and salt them in August for winter provisions, when they boil them with cabbage. They also take the old ones in March; but they are then poor, and not so well tasted as the young: they appear first in those islands in February.

3. The pelagica, or stormy petrel, is about the bulk of the house-swallow: the length six inches; the extent of wings, 13. The whole bird is black except the coverts of the tail and vent-feathers, which are white: the bill is hooked at the end: the nostrils tubular: the legs slender, and long. It has the same faculty of spouting oil from its bill as the other species: and Mr Brunnich tells us, that the inhabitants of the Ferroe isles make this bird serve the purposes of a candle, by drawing a wick through the mouth and rump, which being lighted, the flame is fed by the fat and oil of the body. Except in breeding-time, it is always at sea; and is seen all over the vast Atlantic ocean, at the greatest distance

Procellaria.
Process.

distance from land; often following the vessels in great flocks, to pick up any thing that falls from on board: for trial sake, chopped straw has been flung over, which they would stand on with expanded wings; but were never observed to settle on or swim in the water: it presages bad weather, and cautions the seamen of the approach of a tempest, by collecting under the stern of the ships: it braves the utmost fury of the storm, sometimes skimming with incredible velocity along the hollows of the waves, sometimes on the summits: Clusius makes it the Camilla of the sea.

*Vel mare per medium fluctu suspensa tument
Ferret iter, celeres nec tingeret aequore plantas.* VIRG.

She swept the seas; and, as she skimm'd along,
Her flying feet unbath'd on billows hung. DRYDEN.

These birds are the *cyphelli* of Pliny, which he places among the *apodes* of Aristotle; not because they wanted feet, but were *κακοποδα*, or had bad or useless ones; an attribute he gives to these species, on a supposition that they were almost always on the wing. In August 1772, Mr Pennant found them on the rocks called *Macdonald's Table*, off the north end of the isle of Skie; so conjectures they breed there. They lurked under the loose stones, but betrayed themselves by their twittering noise.

In Mr White's *Journal of a Voyage to New South Wales* we have a figure of the fuliginous petrel, with a whitish beak; which he takes to be a variety of the *Procellaria Æquinoctialis* of Linnæus. It is nearly of the size of a raven; its colour is a deep sooty brown or blackish; on the chin there is a small patch of white running down a little on each side from the lower mandible; the beak is of a yellowish white. See Plate CCCCXVI. Captain Bligh, in his *Voyage to the South Seas*, in S. Lat. 60. 1. and W. Long. 71. 45. saw both petrels and pintadas; some of which he took with baited hooks.

PROCESS, in law, denotes the proceedings in any cause, real or personal, civil or criminal, from the original writ to the end thereof.

In a more limited sense, process denotes that by which a man is called first into any temporal court.

It is the next step for carrying on the suit, after suing out the original writ. See *Suit* and *Writ*.

It is the method taken by the law to compel a compliance with the original writ, of which the primary step is by giving the party notice to obey it. This notice is given upon all real *præcipes*; and also upon all personal writs for injuries not against the peace, by *summons*; which is a warning to appear in court at the return of the original writ, given to the defendant by two of the sheriff's messengers called *summoners*, either in person, or left at his house or land: in like manner as in the civil law the first process is by personal citation, *in jus vocando*. This warning on the land is given, in real actions, by erecting a white stick or wand on the defendant's grounds (which stick or wand among the northern nations is called the *baculus nunciatorius*), and by statute 31 Eliz. c. 3. the notice must also be proclaimed on some Sunday before the door of the parish-church.

If the defendant disobey this verbal monition, the next process is by writ of *attachment* or *pone*; so called from the words of the writ, *pone per vadium et salvos plegios*, "put by gage and safe pledges A. B. the de-

fendant," &c. This is a writ not issuing out of chancery, but out of the court of common-pleas, being grounded on the non-appearance of the defendant at the return of the original writ; and thereby the sheriff is commanded to attach him, by taking *gage*, that is, certain of his goods, which he shall forfeit if he doth not appear; or by making him find *safe pledges* or sureties, which shall be amerced in case of his non-appearance. This is also the first and immediate process, without any previous summons, upon actions of trespass *vi et armis*, or for other injuries, which, though not forcible, are yet trespasses against the peace, as *deceit* and *conspiracy*; where the violence of the wrong requires a more speedy remedy, and therefore the original writ commands the defendant to be at once attached, without any precedent wanting.

If, after attachment, the defendant neglects to appear, he not only forfeits this security, but is moreover to be farther compelled by writ of *distingas*, or distress infinite: which is a subsequent process issuing from the court of common-pleas, commanding the sheriff to distress the defendant from time to time, and continually afterwards, by taking his goods and the profits of his lands, which are called *issues*, and which he forfeits to the king if he doth not appear. But the issues may be sold, if the court shall so direct, in order to defray the reasonable costs of the plaintiff. In like manner, by the civil law, if the defendant absconds, so that the citation is of no effect, *mittitur adversarius in possessionem bonorum ejus*.

And here, by the common as well as the civil law, the process ended in case of injuries without force: the defendant if he had any substance, being gradually stripped of it all by repeated distresses, till he rendered obedience to the king's writ; and, if he had no substance, the law held him incapable of making satisfaction, and therefore looked upon all further process as nugatory. And besides, upon feudal principles, the person of a feudatory was not liable to be attached for injuries merely civil, lest thereby his lord should be deprived of his personal services. But, in cases of injury accompanied with force, the law, to punish the breach of the peace and prevent its disturbance for the future, provided also a process against the defendant's person, in case he neglected to appear upon the former process of attachment, or had no substance whereby to be attached; subjecting his body to imprisonment by the writ of *capias ad respondendum*. But this immunity of the defendant's person, in case of peaceable though fraudulent injuries, producing great contempt of the law in indigent wrongdoers, a *capias* was also allowed, to arrest the person in actions of account, though no breach of the peace be suggested, by the statutes of Marlbridge, 52 Hen. III. c. 23. and Westm. 2. 13 Edw. I. c. 11. in actions of debt and detainue, by statute 25 Edw. III. c. 17. and in all actions on the case, by statute 19 Hen. VII. c. 9. Before which last statute a practice had been introduced of commencing the suit by bringing an original writ of trespass *quare clausum fregit*, by breaking the plaintiff's close, *vi et armis*; which by the old common law subjected the defendant's person to be arrested by writ of *capias*: and then afterwards, by connivance of the court, the plaintiff might proceed to prosecute for any other less forcible injury. This practice (through custom rather than necessity, and for saving some trouble and

pence

Process.

pence, in suing out a special original adapted to the particular injury) still continues in almost all cases, except in actions of debt; though now, by virtue of the statutes above cited and others, a *capias* might be had upon almost every species of complaint.

If therefore the defendant, being summoned or attached, makes default, and neglects to appear; or if the sheriff returns a *nihil*, or that the defendant hath nothing whereby he may be summoned, attached, or distrained, the *capias* now usually issues: being a writ commanding the sheriff to take the body of the defendant, if he may be found in his bailiwick or county, and him safely to keep, so that he may have him in court on the day of the return, to answer to the plaintiff of a plea of debt, or trespass, &c. as the case may be. This writ, and all others subsequent to the original writ, not issuing out of chancery, but from the court into which the original was returnable, and being grounded on what has passed in that court in consequence of the sheriff's return, are called *judicial*, not *original*, writs; they issue under the private seal of that court, and not under the great seal of England; and are *tested*, not in the king's name, but in that of the chief justice only. And these several writs being grounded on the sheriff's return, must respectively bear date the same day on which the writ immediately preceding was returnable.

This is the regular and orderly method of process. But it is now usual in practice to sue out the *capias* in the first instance, upon a supposed return of the sheriff; especially if it be suspected that the defendant, upon notice of the action, will abscond; and afterwards a fictitious original is drawn up, with a proper return thereupon, in order to give the proceedings a colour of regularity. When this *capias* is delivered to the sheriff, he by his under-sheriff grants a warrant to his inferior officers or bailiffs to execute it on the defendant. And, if the sheriff of Oxfordshire (in which county the injury is supposed to be committed and the action is laid) cannot find the defendant in his jurisdiction, he returns that he is not found, *non est inventus*, in his bailiwick; whereupon another writ issues, called a *testatum capias*, directed to the sheriff of the county where the defendant is supposed to reside, as if Berkshire, reciting the former writ, and that it is testified, *testatum est*, that the defendant lurks or wanders in his bailiwick, where he is commanded to take him, as in the former *capias*. But here also, when the action is brought in one county and the defendant lives in another, it is usual, for saving trouble, time, and expence, to make out a *testatum capias* at the first; supposing not only an original, but also a former *capias*, to have been granted; which in fact never was. And this fiction, being beneficial to all parties, is readily acquiesced in, and is now become the settled practice; being one among many instances to illustrate that maxim of law, that *in fisione juris consistit æquitas*.

But where a defendant absconds, and the plaintiff would proceed to an outlawry against him, an original writ must then be sued out regularly, and after that a *capias*. And if the sheriff cannot find the defendant upon the first writ of *capias*, and returns a *non est inventus*, there issues out an *alias* writ, and after that a *pluries*, to the same effect as the former: only after these words "we command you," this clause is inserted, "as we have formerly," or, "as we have often commanded you;"—

Process.

"*sicut alias*," or, "*sicut pluries, præcepimus*." And if a *non est inventus* is returned upon all of them, then a writ of *exigent* or *exigi facias* may be sued out, which requires the sheriff to cause the defendant to be proclaimed, required, or exacted, in five county-courts successively, to render himself; and if he does, then to take him, as in a *capias*: but if he does not appear, and is returned *quinto exactus*, he shall then be outlawed by the coroners of the county. Also by statute 6 Hen. VIII. c. 4. and 31 Eliz. c. 3. whether the defendant dwells within the same or another county than that wherein the *exigent* is sued out, a writ of proclamation shall issue out at the same time with the *exigent*, commanding the sheriff of the county, wherein the defendant dwells, to make three proclamations thereof in places the most notorious, and most likely to come to his knowledge, a month before the outlawry shall take place. Such outlawry is putting a man out of the protection of the law, so that he is incapable to bring an action for redress of injuries; and it is also attended with a forfeiture of all one's goods and chattels to the king. And therefore, till some time after the conquest, no man could be outlawed but for felony: but in Bracton's time, and somewhat earlier, process of outlawry was ordained to lie in all actions for trespasses *vi et armis*. And since, by a variety of statutes (the same which allow the writ of *capias* before-mentioned) process of outlawry doth lie in divers actions that are merely civil; providing they be commenced by original and not by bill. If after outlawry the defendant appears publicly, he may be arrested by a writ of *capias utlagatum*, and committed till the outlawry be reversed. Which reversal may be had by the defendant's appearing personally in court (and in the king's bench without any personal appearance, so that he appears by attorney, according to statute 4 & 5 W. & M. c. 18.) and any plausible cause, however slight, will in general be sufficient to reverse it, it being considered only as a process to compel an appearance. But then the defendant must pay full costs, and put the plaintiff in the same condition as if he had appeared before the writ of *exigi facias* was awarded.

Such is the first process in the court of common pleas. In the king's bench they may also (and frequently do) proceed in certain causes, particularly in actions of ejectment and trespass, by *original* writ, with *attachment* and *capias* thereon; returnable, not at Westminster, where the common pleas are now fixed in consequence of *magna charta*, b. c. *ubicunque fuerimus in Anglia*, whereforever the king shall then be in England; the king's bench being removable into any part of England at the pleasure and discretion of the crown. But the more usual method of proceeding therein is without any original but by a peculiar species of process intitled a *bill of Middlesex*; and therefore so intitled, because the court now sits in that county; for if it sat in Kent, it would then be a bill of Kent. For though, as the justices of this court have, by its fundamental constitution, power to determine all offences and trespasses, by the common law and custom of the realm, it needed no original writ from the crown to give it cognizance of any misdemeanour in the county wherein it resides; yet as, by this court's coming into any county, it immediately superseded the ordinary administration of justice by the general commissions of *eyre* and of *oyer and terminer*, a process of its own became necessary, within the county where

Process. it fat, to bring in such persons as were accused of committing any forcible injury. The bill of Middlesex (which was formerly always founded on a plea of trespass *quare clausum fregit*, entered on the records of the court) is a kind of *capias*, directed to the sheriff of that county, and commanding him to take the defendant, and have him before his lord the king at Westminster on a day prefixed, to answer to the plaintiff of a plea of trespass. For this accusation of trespass it is that gives the court of king's bench jurisdiction in other civil causes, since, when once the defendant is taken into custody of the marshal, or prison-keeper of this court, for the supposed trespass, he, being then a prisoner of this court, may here be prosecuted for any other species of injury. Yet, in order to found this jurisdiction, it is not necessary that the defendant be actually the marshal's prisoner; for, as soon as he appears, or puts in bail, to the process, he is deemed by so doing to be in such custody of the marshal as will give the court a jurisdiction to proceed. And, upon these accounts, in the bill or process, a complaint of trespass is always suggested, whatever else may be the real cause of action. This bill of Middlesex must be served on the defendant by the sheriff, if he finds him in that county: but if he returns, *non est inventus*, then there issues out a writ of *latitat*, to the sheriff of another county, as Berks; which is similar to the *testatum capias* in the common pleas, and recites the bill of Middlesex and the proceedings thereon, and that it is testified that the defendant *latitat et discurrit*, lurks and wanders about in Berks; and therefore commands the sheriff to take him, and have his body in court on the day of the return. But as in the common pleas the *testatum capias* may be sued out upon only a supposed, and not an actual preceding, *capias*; so in the king's bench a *latitat* is usually sued out upon only a supposed, and not an actual, bill of Middlesex. So that, in fact, a *latitat* may be called the first process in the court of king's bench, as the *testatum capias* is in the common pleas. Yet, as in the common pleas, if the defendant lives in the county wherein the action is laid, a common *capias* suffices; so in the king's bench likewise, if he lives in Middlesex, the process must still be by bill of Middlesex only.

In the exchequer the first process is by writ of *quo minus*, in order to give the court a jurisdiction over pleas between party and party. In which writ the plaintiff is alleged to be the king's farmer or debtor, and that the defendant hath done him the injury complained of, *quo minus sufficiens existit*, by which he is less able to pay the king his rent or debt. And upon this the defendant may be arrested as upon a *capias* from the common pleas.

Thus differently do the three courts set out at first, in the commencement of a suit, in order to intitle the two courts of king's bench and exchequer to hold plea in subjects causes, which by the original constitution of Westminster-hall they were not empowered to do. Afterwards, when the cause is once drawn into the respective courts, the method of pursuing it is pretty much the same in all of them.

If the sheriff had found the defendant upon any of the former writs, the *capias latitat*, &c. he was anciently obliged to take him into custody, in order to produce him in court upon the return, however small and minute the cause of action might be. For, not

having obeyed the original summons, he had shown a contempt of the court, and was no longer to be trusted at large. But when the summons fell into disuse, and the *capias* became in fact the first process, it was thought hard to imprison a man for a contempt which was only supposed: and therefore, in common cases, by the gradual indulgence of the courts (at length authorized by statute 12 Geo. I. c. 29. which was amended by statute 5. Geo. II. c. 27. and made perpetual by statute 21 Geo. II. c. 3.) the sheriff or his officer can now only personally serve the defendant with the copy of the writ or process, and with notice in writing to appear by his attorney in court to defend this action; which in effect reduces it to a mere summons. And if the defendant thinks proper to appear upon this notice, his appearance is recorded, and he puts in sureties for his future attendance and obedience; which sureties are called *common bail*, being the same two imaginary persons that were pledges for the plaintiff's prosecution, John Doe and Richard Roe. Or, if the defendant does not appear upon the return of the writ, or within four (or in some cases eight) days after, the plaintiff may enter an appearance for him, as if he had really appeared; and may file common bail in the defendant's name, and proceed thereupon as if the defendant had done it himself.

But if the plaintiff will make affidavit, or assert upon oath, that the cause of action amounts to ten pounds or upwards, then in order to arrest the defendant, and make him put in substantial sureties for his appearance, called *special bail*, it is required by statute 13 Car. II. stat. 2. c. 2. that the true cause of action should be expressed in the body of the writ or process: else no security can be taken in a greater sum than L. 40. This statute (without any such intention in the makers) had like to have ousted the king's bench of all its jurisdiction over civil injuries without force; for, as the bill of Middlesex was framed only for actions of trespass, a defendant could not be arrested and held to bail thereupon for breaches of civil contracts. But to remedy this inconvenience, the officers of the king's bench devised a method of adding what is called a clause of *ac etiam* to the usual complaint of trespass; the bill of Middlesex commanding the defendant to be brought in to answer the plaintiff of a plea of trespass, and also to a bill of debt: the complaint of trespass giving cognizance to the court, and that of debt authorizing the arrest. In imitation of which, lord chief justice North, a few years afterwards, in order to save the suitors of his court the trouble and expence of suing out special originals, directed, that in the common pleas, besides the usual complaint of breaking the plaintiff's close, a clause of *ac etiam* might be also added to the writ of *capias*, containing the true cause of action; as, "that the said Charles the defendant may answer to the plaintiff of a plea of trespass in breaking his close: and also, *ac etiam* may answer him, according to the custom of the court, in a certain plea of trespass upon the case, upon promises, to the value of L. 20, &c." The sum sworn to by the plaintiff is marked upon the back of the writ; and the sheriff, or his officer the bailiff, is then obliged actually to arrest or take into custody the body of the defendant, and, having so done, to return the writ with a *cepi corpus* indorsed thereon. See ARREST.

When the defendant is regularly arrested, he must either

Process.

Process.

either go to prison, for safe custody; or put in *special bail* to the sheriff. For, the intent of the arrest being only to compel an appearance in court at the return of the writ, that purpose is equally answered, whether the sheriff detains his person, or takes sufficient security for his appearance, called *bail* (from the French word *bailier*, "to deliver"), because the defendant is bailed, or delivered, to his sureties, upon their giving security for his appearance; and is supposed to continue in their friendly custody instead of going to gaol. See *BAIL*. The method of putting in bail to the sheriff is by entering into a bond or obligation, with one or more sureties, (not fictitious persons, as in the former case of common bail, but real, substantial, responsible bondsmen), to insure the defendant's appearance at the return of the writ; which obligation is called the *bail-bond*. The sheriff, if he pleases, may let the defendant go without any sureties; but that is at his own peril: for, after once taking him, the sheriff is bound to keep him safely, so as to be forthcoming in court; otherwise an action lies against him for an escape. But, on the other hand, he is obliged, by statute 23 Hen. VI. c. 10. to take (if it be tendered) a sufficient bail-bond; and, by statute 12 Geo. I. c. 29. the sheriff shall take bail for no other sum than such as is sworn to by the plaintiff, and indorsed on the back of the writ.

Upon the return of the writ, or within four days after, the defendant must *appear* according to the exigency of the writ. This *appearance* is effected by putting in and justifying bail *to the action*; which is commonly called *putting in bail above*. If this be not done, and the bail that were taken by the sheriff *below* are responsible persons, the plaintiff may take an assignment from the sheriff of the bail-bond (under the statute 4 & 5 Ann. c. 16.) and bring an action thereupon against the sheriff's bail. But if the bail so accepted by the sheriff be insolvent persons, the plaintiff may proceed against the sheriff himself, by calling upon him, first to return the writ (if not already done), and afterwards to bring in the body of the defendant. And if the sheriff does not then cause sufficient bail to be put in *above*, he will himself be responsible to the plaintiff.

The bail *above*, or bail *to the action*, must be put in either in open court, or before one of the judges thereof; or else, in the country, before a commissioner appointed for that purpose by virtue of the statute 4 W. & M. c. 4. which must be transmitted to the court. These bail, who must at least be two in number, must enter into a recognizance in court, or before the judge or commissioner, whereby they do jointly and severally undertake, that if the defendant be condemned in the action, he shall pay the costs and condemnation, or render himself a prisoner, or that they will pay it for him: which recognizance is transmitted to the court in a slip of parchment, intitled a *bail-piece*. And, if required, the bail must *justify* themselves in court, or before the commissioner in the country, by swearing themselves housekeepers, and each of them to be worth double the sum for which they are bail, after payment of all their debts. This answers in some measure to the *stipulatio* or *satisfactio* of the Roman laws, which is mutually given by each litigant party to the other: by the plaintiff that he will prosecute his suit, and pay the costs if he loses his cause; in like manner as our law

still requires nominal pledges of prosecution from the plaintiff: by the defendant, that he shall continue in court, and abide the sentence of the judge, much like our special bail; but with this difference, that the *fidejussores* were there absolutely bound *judicatum solvere*, to see the costs and condemnation paid at all events: whereas our special bail may be discharged, by surrendering the defendant into custody within the time allowed by law; for which purpose they are at all times entitled to a warrant to apprehend him.

Special bail is required (as of course) only upon actions of debt, or actions on the case in trover, or for money due, where the plaintiff can swear that the cause of action amounts to ten pounds: but in actions where the damages are precarious, being to be assessed *ad libitum* by a jury, as in actions for words, ejectment, or trespass, it is very seldom possible for a plaintiff to swear to the amount of his cause of action; and therefore no special bail is taken thereon, unless by a judge's order, or the particular directions of the court, in some peculiar species of injuries, as in cases of mayhem or atrocious battery; or upon such special circumstances as make it absolutely necessary that the defendant should be kept within the reach of justice. Also in actions against heirs, executors and administrators, for debts of the deceased, special bail is not demandable; for the action is not so properly against them in person, as against the effects of the deceased in their possession. But special bail is required even of them, in actions for a *devastavit*, or wasting the goods of the deceased; that wrong being of their own committing.

Thus much for *process*; which is only meant to bring the defendant into court, in order to contest the suit, and abide the determination of the law. When he appears either in person as a prisoner, or out upon bail, then follow the *pleadings* between the parties. See *PLEADINGS*.

Process upon an Indictment. See *PROSECUTION*. The proper process on an indictment for any petty misdemeanor, or on a penal statute, is a writ of *venire facias*, which is in the nature of a summons to cause the party to appear. And if by the return to such *venire* it appears that the party hath lands in the county whereby he may be distrained, then a *districe infinite* shall be issued from time to time till he appears. But if the sheriff returns, that he hath no lands in his bailiwick, then (upon his non-appearance) a writ of *capias* shall issue, which commands the sheriff to take his body, and have him at the next assizes; and if he cannot be taken upon the first *capias*, a second and a third shall issue, called an *alias*, and a *pluries capias*. But, on indictments for treason or felony, a *capias* is the first process: and, for treason or homicide, only one shall be allowed to issue, or two in the case of other felonies, by statute 25 Edw. III. c. 14. though the usage is to issue only one in any felony; the provisions of this statute being in most cases found impracticable. And so, in the case of misdemeanors, it is now the usual practice for any judge of the court of king's bench, upon certificate of an indictment found, to award a writ of *capias* immediately, in order to bring in the defendant. But if he absconds, and it is thought proper to pursue him to an outlawry, then a greater exactness is necessary. For, in such case, after the several writs have issued in a regular number, according to the nature of the respective

Process.

Process.

spective crimes, without any effect, the offender shall be put in the *exigent* in order to his outlawry: that is, he shall be exacted, proclaimed, or required, to surrender, at five county-courts; and if he be returned *quinto exactus*, and does not appear at the fifth exaction or requisition, then he is adjudged to be *outlawed*, or put out of the protection of the law; so that he is incapable of taking the benefit of it in any respect, either by bringing actions or otherwise.

The punishment, for outlawries upon indictments for misdemeanors, is the same as for outlawries upon civil actions; viz. forfeiture of goods and chattels. But an outlawry in treason or felony amounts to a conviction and attainder of the offence charged in the indictment, as much as if the offender had been found guilty by his country. His life is, however, still under the protection of the law, as hath elsewhere been observed; (see *HOMICIDE*): that though anciently an outlawed felon was said to have *caput lupinum*, and might be knocked on the head like a wolf, by any one that should meet him; because, having renounced all law, he was to be dealt with as in a state of nature, when every one that should find him might slay him: yet now, to avoid such inhumanity, it is holden that no man is intitled to kill him wantonly or wilfully; but in so doing is guilty of murder, unless it happens in the endeavour to apprehend him. For any person may arrest an outlaw on a criminal prosecution, either of his own head, or by writ or warrant of *capias utlagatum*, in order to bring him to execution. But such outlawry may be frequently reversed by writ of error, the proceedings therein being (as it is fit they should be) exceedingly nice and circumstantial; and if any single minute point be omitted or misconducted, the whole outlawry is illegal, and may be reversed: upon which reversal the party accused is admitted to plead to, and defend himself against, the indictment.

Thus much for process to bring in the offender after indictment found; during which stage of the prosecution it is that writs of *certiorari facias* are usually had, though they may be had at any time before trial, to certify and remove the indictment, with all the proceedings thereon, from any inferior court of criminal jurisdiction into the court of king's bench; which is the sovereign ordinary court of justice in causes criminal. And this is frequently done for one of these four purposes; either, 1. To consider and determine the validity of appeals or indictments and the proceedings thereon; and to quash or confirm them as there is cause; or, 2. Where it is surmised that a partial or insufficient trial will probably be had in the court below, the indictment is removed, in order to have the prisoner or defendant tried at the bar of the court of king's bench, or before the justices of *nisi prius*: or, 3. It is so removed, in order to plead the king's pardon there: or, 4. To issue process of outlawry against the offender, in those counties or places where the process of the inferior judges will not reach him. Such writ of *certiorari*, when issued and delivered to the inferior court for removing any record or other proceeding, as well upon indictment as otherwise, supercedes the jurisdiction of such inferior court, and makes all subsequent proceedings therein entirely erroneous and illegal; unless the court of king's bench remands the record to the court below, to be there tried and determined. A

VOL. XV.

certiorari may be granted at the instance of either the prosecutor or the defendant: the former as a matter of right, the latter as a matter of discretion; and therefore it is seldom granted to remove indictments from the justices of gaol-delivery, or after issue joined, or confession of the fact in any of the courts below.

At this stage of prosecution also it is, that indictments found by the grand jury against a peer, must, in consequence of a writ of *certiorari*, be certified and transmitted into the court of parliament, or into that of the lord high steward of Great Britain; and that, in places of exclusive jurisdiction, as the two universities, indictments must be delivered (upon challenge and claim of cognizance) to the courts therein established by charter, and confirmed by act of parliament, to be there respectively tried and determined. See *PLEA*.

PROCESS, in chemistry, the whole course of an experiment or series of operations, tending to produce something new.

PROCESS, in anatomy, denotes any protuberance or eminence in a bone.

PROCESSION, a ceremony in the Romish church, consisting of a formal march of the clergy and people, putting up prayers, &c. and in this manner visiting some church, &c. They have also processions of the host or sacrament, &c. See *HOST*.

PROCHEIN AMY, in law, the person next akin to a child in non-age, and who, in that respect, is allowed to act for him, and be his guardian, &c. if he hold land in soccage.

To sue, an infant is not allowed to make an attorney; but the court will admit his next friend as plaintiff, or his guardian as defendant.

PROCKIA, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking with those of which the order is doubtful. The calyx is triphyllous, besides two leaflets at the base. There is no corolla; the berry is quinqueangular, and polyspermous.

PROCLAMATION, a public notice given of any thing of which the magistrate thinks proper to advertise the people.

Proclamations are a branch of the king's prerogative*; and have then a binding force, when (as Sir Edward Coke observes) they are grounded upon and enforce the laws of the realm. For, though the making of laws is entirely the work of a distinct part, the legislative branch of the sovereign power, yet the manner, time, and circumstances of putting those laws in execution, must frequently be left to the discretion of the executive magistrate. And therefore his constitutions or edicts, concerning those points which we call *proclamations*, are binding upon the subject, where they do not either contradict the old laws, or tend to establish new ones; but only enforce the execution of such laws as are already in being, in such manner as the king shall judge necessary. Thus the established law is, that the king may prohibit any of his subjects from leaving the realm: a proclamation therefore forbidding this in general for three weeks, by laying an embargo upon all shipping in time of war, will be equally binding as an act of parliament, because founded upon a prior law. But a proclamation to lay an embargo in time of peace upon all vessels laden with wheat, (though in the time of a public scarcity), being contrary to law,

Proclus
Prodigality.

and particularly to statute 22 Car. II. c. 13. the advisers of such a proclamation, and all persons acting under it, found it necessary to be indemnified by a special act of parliament, 7 Geo. III. c. 7. A proclamation for disarming Papists is also binding, being only in execution of what the legislature has first ordained: but a proclamation for allowing arms to Papists, or for disarming any Protestant subjects, will not bind; because the first would be to assume a dispensing power, the latter a legislative one; to the vesting of either of which in any single person the laws of England are absolutely strangers. Indeed, by the statute 31 Hen. VIII. c. 8. it was enacted, that the king's proclamations should have the force of acts of parliament: a statute, which was calculated to introduce the most despotic tyranny; and which must have proved fatal to the liberties of the kingdom, had it not been luckily repealed in the minority of his successor, about five years after. By a late act of parliament the king is empowered to raise regiments of Roman Catholics, to serve in the present war.

PROCLUS, surnamed DIADOCUS, a Greek philosopher and mathematician, was born in Lycia, and lived about the year 500. He was the disciple of Syrianus, and had a great share in the friendship of the emperor Anastasius. It is said, that when Vitalian laid siege to Constantinople, Proclus burnt his ships with large brazen speculums. This philosopher was a Pagan, and wrote against the Christian religion. There are still extant his Commentaries on some of Plato's books, and other of his works written in Greek.

PROCONSUL, a Roman magistrate, sent to govern a province with consular authority.

The proconsuls were appointed out of the body of the senate; and usually as the year of any one's consulship expired, he was sent proconsul into some province.

The proconsuls decided cases of equity and justice, either privately in their pretorium or palace, where they received petitions, heard complaints, granted writs under their seal, and the like; or else publicly, in the common hall, with the usual formalities observed in the court of judicature at Rome. They had besides, by virtue of their edicts, the power of ordering all things relating to the tribunes, taxes, contributions, and provisions of corn and money, &c. Their office lasted only a year. See CONSUL.

PROCOPIUS, a famous Greek historian, born in Cæsaria, acquired great reputation by his works in the reign of Justinian, and was secretary to Belisarius during all the wars carried on by that general in Persia, Africa, and Italy. He at length became senator, obtained the title of *illustrious*, and was made pretor of Constantinople.

PROCREATION, the begetting and bringing forth young. See GENERATION and SEMEN.

PROCTOR, a person commissioned to manage another person's cause in any court of the civil or ecclesiastical law.

PROCTOR, in the English universities. See UNIVERSITY.

PROCURATION, an act or instrument by which a person is empowered to treat, transact, receive, &c. in another person's name.

PROCURATOR. See PROCTOR.

PRODICALITY, means extravagance, profusion, waste, or excessive liberality, and is the opposite ex-

treme to the vice of parsimony. By the Roman law, if a man by notorious prodigality was in danger of wasting his estate, he was looked upon as *non compos*, and committed to the care of curators, or tutors, by the prætor. And by the laws of Solon, such prodigals were branded with perpetual infamy.

PRODUCT, in arithmetic and geometry, the factum of two or more numbers, or lines, &c. into one another: thus $5 \times 4 = 20$ the product required.

PROEDRI, among the Athenians, were magistrates, who had the first seats at the public assemblies, and whose office it was to propose at each assembly the things to be deliberated upon and determined. Their office always ended with the meeting. Their number was nine, so long as the tribes were ten in number.

PROFANATION, the acting disrespectfully to sacred things.

PROFANE, a term used in opposition to *holy*; and in general is applied to all persons who have not the sacred character, and to things which do not belong to the service of religion.

PROFESSION means a calling, vocation, or known employment. In Knox's *Essays*, vol. 1st, page 234, we find an excellent paper on the choice of a profession, which that elegant writer concludes thus: "All the occupations of life (says he) are found to have their advantages and disadvantages admirably adapted to preserve the just equilibrium of happiness. This we may confidently assert, that, whatever are the inconveniences of any of them, they are all preferable to a life of inaction; to that wretched listlessness, which is constrained to pursue pleasure as a business, and by rendering it the object of severe and unvaried attention, destroys its very essence."

Among the Romanists profession denotes the entering into a religious order, whereby a person offers himself to God by a vow of inviolably observing obedience, chastity, and poverty.

PROFESSOR, in the universities, a person who teaches or reads public lectures in some art or science from a chair for the purpose.

PROFILE, in architecture, the draught of a building, fortification, &c. wherein are expressed the several heights, widths, and thickneses, such as they would appear were the building cut down perpendicularly from the roof to the foundation. Whence the profile is also called the *section*, sometimes *orthographical section*, and by Vitruvius also *sciagraphy*.

Profile, in this sense, amounts to the same with *elevation*; and stands opposed to a *plan* or *ichnography*.

PROFILE is also used for the contour or out-line of a figure, building, member of architecture, or the like; as a base, a cornice, &c. Hence *profiling* is sometimes used for designing, or describing the member with rule, compass, &c.

PROFILE, in sculpture and painting.—A head, a portrait, &c. are said to be in *profile*, when they are represented sidewise, or in a side-view; as, when in a portrait there is but one side of the face, one eye, one cheek, &c. shown, and nothing of the other.—On almost all medals, the faces are represented in *profile*.

PROFLUVIUM, in medicine, denotes a flux, or liquid evacuation of any thing.

PROGNOSTIC, among physicians, signifies a judgment concerning the event of a disease, as whether it shall end in life or death, be short or long, mild or malignant, &c.

PROGRAMMA,

Product
Prognostic.

Program-
ma.

PROGRAMMA, anciently signified a letter sealed with the king's seal.

Programma is also an university term for a billet or advertisement, posted up or given into the hand, by way of invitation to an oration, &c. containing the argument, or so much as is necessary for understanding thereof.

PROGRESSION, in general, denotes a regular advancing, or going forward, in the same course and manner.

Progreffion.

PROGRESSION, in mathematics, is either arithmetical or geometrical. Continued arithmetic proportion is, where the terms do increase and decrease by equal differences, and is called *arithmetical progression* :

Thus $\left\{ \begin{array}{l} a, a+d, a+2d, a+3d, \&c. \text{ increasing} \\ a, a-d, a-2d, a-3d, \&c. \text{ decreasing} \end{array} \right\}$ by the difference d .

In numbers $\left\{ \begin{array}{l} 2, 4, 6, 8, 10, \&c. \text{ increasing} \\ 10, 8, 6, 4, 2, \&c. \text{ decreasing} \end{array} \right\}$ by the difference 2.

Geometric Progression, or *Continued Geometric Proportion*, is when the terms do increase or decrease by equal ratios : thus,

$\left\{ \begin{array}{l} a, ar, arr, arrr, \&c. \text{ increasing} \\ a, \frac{a}{r}, \frac{a}{rr}, \frac{a}{rrr}, \&c. \text{ decreasing} \end{array} \right\}$ from a continual $\left\{ \begin{array}{l} \text{multiplication} \\ \text{division} \end{array} \right\}$ by r .

$\left\{ \begin{array}{l} 2, 4, 8, 16, 32, 64, \text{ increasing} \\ 64, 32, 16, 8, 4, 2, \text{ decreasing} \end{array} \right\}$ from a continual $\left\{ \begin{array}{l} \text{multiplication} \\ \text{division} \end{array} \right\}$ by 2.

See the article FLUXIONS, GEOMETRY, and SERIES.

Object of
the science.2
Effect of
gravity on
projected
bodies.

THIS is the name for that part of mechanical philosophy which treats of the motion of bodies any how projected from the surface of this earth, and influenced by the action of terrestrial gravity.

It is demonstrated in the physical part of astronomy that a body so projected must describe a conic section, having the centre of the earth in one focus ; and that it will describe round that focus areas proportional to the times. And it follows from the principles of that science, that if the velocity of projection exceeds 36700 feet in a second, the body (if not resisted by the air) would describe a hyperbola ; if it be just 36700, it would describe a parabola ; and if it be less than this, it would describe an ellipsis. If projected directly upwards, in the first case, it would never return, but proceed for ever ; its velocity continually diminishing, but never becoming less than an assignable portion of the excess of the initial velocity above 36700 feet in a second ; in the second case, it would never return, its velocity would diminish without end, but never be extinguished. In the third case, it would proceed till its velocity was reduced to an assignable portion of the difference between 36700 and its initial velocity ; and would then return, regaining its velocity by the same degrees, and in the same places, as it lost it. These are necessary consequences of a gravity directed to the centre of the earth, and inversely proportional to the square of the distance. But in the greatest projections that we are able to make, the gravitations are so nearly equal, and in directions so nearly parallel, that it would be ridiculous assentation to pay any regard to the deviations from equality and parallelism. A bullet rising a mile above the surface of the earth loses only $\frac{1}{88388}$ of its weight, and a horizontal range of 4 miles makes only 4 of deviation from parallelism.

Let us therefore assume gravitation as equal and parallel. The errors arising from this assumption are quite insensible in all the uses which can be made of this theory.

The theory itself will ever be regarded with some veneration and affection by the learned. It was the first fruits of mathematical philosophy. Galileo was the first who applied mathematical knowledge to the

motions of free bodies, and this was the subject on which he exercised his fine genius.

Gravity must be considered by us as a constant or uniform accelerating or retarding force, according as it produces the descent, or retards the ascent, of a body. A constant or invariable accelerating force is one which produces an uniform acceleration ; that is, which in equal times produces equal increments of velocity, and therefore produces increments of velocity proportional to the times in which they are produced. Forces are of themselves imperceptible, and are seen only in their effects ; and they have no measure but the effect, or what *measures* the effect ; and every thing which we can discover with regard to those measures, we must affirm with regard to the things of which we assume them as the measures. Therefore,

The motion of a falling body, or of a body projected directly downwards, is uniformly accelerated ; and that of a body projected directly upwards is uniformly retarded : that is, the acquired velocities are as the times in which they are acquired by falling, and the extinguished velocities are as the times in which they are extinguished.

Cor. 1. If bodies simply fall, not being projected downwards by any external force, the times of the falls are proportional to the final velocities ; and the times of ascents, which terminate by the action of gravity alone, are proportional to the initial velocities.

2. The spaces described by a heavy body falling from rest are as the squares of the acquired velocities ; and the differences of these spaces are as the differences of the squares of the acquired velocities : and, on the other hand, the heights to which bodies projected upwards will rise, before their motions be extinguished, are as the squares of the initial velocities.

3. The spaces described by falling bodies are proportional to the squares of the times from the beginning of the fall ; and the spaces described by bodies projected directly upwards are as the squares of the times of the ascents.

4. The space described by a body falling from rest is one half of the space which the body would have uniformly described in the same time, with the velocity acquired

3

uniform.4
Consequences of
this fact5
Corollaries
drawn
from it.

quired by the fall.—And the height to which a body will rise, in opposition to the action of gravity, is one half of the space which it would uniformly describe in the same time with the initial velocity.

In like manner the difference of the spaces which a falling or rising body describes in any equal successive parts of its fall or rise, is one half of the space which it would uniformly describe in the same time with the difference of the initial and final velocities.

This proposition will be more conveniently expressed for our purpose thus:

A body moving uniformly during the time of any fall with the velocity acquired thereby, will in that time describe a space double of that fall; and a body projected directly upwards will rise to a height which is one half of the space which it would, uniformly continued, describe in the time of its ascent with the initial velocity of projection.

These theorems have been already demonstrated in a popular way, in the article MECHANICS, sect. vi. § 14, 15, 16, &c. and in GUNNERY. But we would recommend to our readers the 39th prop. of the first book of Newton's *Principia*, as giving the most general investigation of this subject; equally easy with these more loose methods of demonstration, and infinitely superior to them, by being equally applicable to every variation of the accelerating force. See an excellent application of this proposition by Mr Robins, for defining the motion of a ball discharged from a cannon, in the article GUNNERY, n° 15. See another in OPTICS, n° 127. for defining the motion of light in refraction, &c.

6
The force of gravity in falling bodies can be ascertained.

5. It is a matter of observation and experience, that a heavy body falls 16 feet and an inch English measure in a second of time; and therefore acquires the velocity of 32 feet 2 inches *per* second. This cannot be ascertained directly, with the precision that is necessary. A second is too small a portion of time to be exactly measured and compared with the space described; but it is done with the greatest accuracy by comparing the motion of a falling body with that of a pendulum. The time of a vibration is to the time of falling through half the length of the pendulum, as the circumference of a circle is to its diameter. The length of a pendulum can be ascertained with great precision; and it can be lengthened or shortened till it makes just 86,400 vibrations in a day: and this is the way in which the space fallen through in a second has been accurately ascertained.

As all other forces are ascertained by the accelerations which they produce, they are conveniently measured by comparing their accelerations with the acceleration of gravity. This therefore has been assumed by all the later and best writers on mechanical philosophy, as the unit by which every other force is measured. It gives us a perfectly distinct notion of the force which retains the moon in its orbit, when we say it is the 3600th part of the weight of the moon at the surface of the earth. We mean by this, that if a bullet were here weighed by a spring steel-yard, and pulled it out to the mark 3600; if it were then taken to the distance of the moon, it would pull it out only to the mark 1. And we make this assertion on the authority of our having observed that a body at the distance of the moon falls from that distance $\frac{1}{3600}$ part of 16 feet in a second. We do not, therefore, compare the forces, which

are imperceptible things; we compare the accelerations, which are their indications, effects, and measures.

This has made philosophers so anxious to determine with precision the fall of heavy bodies, in order to have an exact value of the accelerating power of terrestrial gravity. Now we must here observe, that this measure may be taken in two ways: we may take the space through which the heavy body falls in a second; or we may take the velocity which it acquires in consequence of gravity having acted on it during a second. The last is the proper measure; for the last is the immediate effect on the body. The action of gravity has changed the state of the body—in what way? by giving it a determination to motion downward: this both points out the kind and the degree or intensity of the force of gravity. The space described in a second by falling, is not an invariable measure; for, in the successive seconds, the body falls through 16, 48, 80, 112, &c. feet, but the changes of the body's state in each second is the same. At the beginning it had no determination to move with any appreciable velocity; at the end of the first second it had a determination by which it would have gone on for ever (had no subsequent force acted on it) at the rate of 32 feet *per* second. At the end of the second second, it had a determination by which it would have moved for ever, at the rate of 64 feet *per* second. At the end of the third second, it had a determination by which it would have moved for ever, at the rate of 96 feet *per* second, &c. &c. The difference of these determinations is a determination to the rate of 32 feet *per* second. This is therefore constant, and the indication and proper measure of the constant or invariable force of gravity. The space fallen through in the first second is of use only as it is one half of the measure of this determination; and as halves have the proportion of their wholes, different accelerating forces may be safely affirmed to be in the proportion of the spaces through which they uniformly impel bodies in the same time. But we should always recollect, that this is but one half of the true measure of the accelerating force. Mathematicians of the first rank have committed great mistakes by not attending to this; and it is necessary to notice it just now, because cases will occur in the prosecution of this subject, where we shall be very apt to confound our reasonings by a confusion in the use of those measures. Those mathematicians who are accustomed to the geometrical consideration of curvilinear motions, are generally disposed to take the *actual deflection* from the tangent as the measure of the deflecting force; while those who treat the same subject algebraically, by the assistance of fluxions, take the *change of velocity*, which is measured by *twice* the deflection. The reason is this: when a body passes through the point B of a curve ABC, fig. 1. if the deflecting force were to cease at that instant, the body would describe the tangent BD in the same time in which it describes the arch BC of the curve, and DC is the deflection, and is therefore taken for the measure of the deflecting force. But the algebraist is accustomed to consider the curve by means of an equation between the abscissæ *Ha*, *Hb*, *Hc*, and their respective ordinates *Aa*, *Bb*, *Cc*; and he measures the deflections by the changes made on the increments of the ordinates. Thus the increment of the ordinate *Aa*, while the body describes the arch AB of the curve, is BG. If the deflecting force were to cease

7
Two modes of determining the fall of heavy bodies.

8
Mistakes of mathematicians on this subject.

Plate
CCCXVII.

9
Particu-
larly of Leib-
nitz.

cease when the body is at B, the next increment would have been equal to BG, that is, it would have been EF; but, in consequence of the deflection, it is only CF: therefore he takes EC for the measure of the deflection, and of the deflecting force. Now EC is ultimately twice DC; and thus the measure of the algebraic (derived solely from the nature of the differential method, and without any regard to physical considerations) happens to coincide with the true physical measure. There is therefore great danger of mixing these measures. Of this we cannot give a more remarkable instance than Leibnitz's attempt to demonstrate the elliptical motion of the planets in the *Leipfic Acts*, 1689. He first considers the subject mechanically, and takes the deflection or DC for the measure of the deflecting force. He then introduces his differential calculus, where he takes the difference of the increments for the measure; and thus brings himself into a confusion, which luckily compensates for the false reasoning in the preceding part of his paper, and gives his result the appearance of a demonstration of Newton's great discovery, while, in fact, it is a confused jumble of assumptions, self-contradictory, and inconsistent with the very laws of mechanics which are used by him in the investigation. Seventeen years after this, in 1706, having been criticised for his bad reasoning, or rather accused of an envious and unsuccessful attempt to appropriate Newton's inventions to himself, he gives a correction of his paralogism, which he calls a correction of language. But he either had not observed where the paralogism lay, or would not let himself down by acknowledging a mistake in what he wished the world to think his own calculus (fluxions); he applied the correction where no fault had been committed, for he had measured both the centrifugal force and the solicitation of gravity in the same way, but had applied the fluxionary expression to the last and not to the first, and, by so doing, he completely destroyed all coincidence between his result and the planetary motions. We mention this instance, not only as a caution to our mathematical readers, but also as a very curious literary anecdote. This dissertation of Leibnitz is one of the most obscure of his obscure writings, but deserves the attention of an intelligent and curious reader, and cannot fail of making an indelible impression on his mind, with relation to the modesty, candour, and probity of the author. It is preceded by a dissertation on the subject which we are now entering upon, the motion of projectiles in a resisting medium. Newton's *Principia* had been published a few years before, and had been reviewed, in a manner shamefully slight, in the *Leipfic Acts*. Both these subjects make the capital articles of that immortal work. Mr Leibnitz published these dissertations, without (says he) having seen Newton's book, in order to show the world that he had, some years before, discovered the same theorems. Mr Nicholas Fatio carried a copy of the *Principia* from the author to Hanover in 1686, where he expected to find Mr Leibnitz; he was then absent, but Fatio saw him often before his return to France in 1687, and does not say that the book was not given him. Read along with these dissertations Dr Keill's letter to John Bernoulli and others, published in the *Journal Littéraire de la Haye* 1714, and to John Bernoulli in 1719.

Newton has been accused of a similar oversight by John Bernoulli, (who indeed calls it a mistake in prin-

ciple) in his Proposition X. Book 2, on the very subject we are now considering. But Dr Keill has shown it to be only an oversight, in drawing the tangent on the wrong side of the ordinate. For in this very proposition Newton exhibits, in the strictest and most beautiful manner, the difference between the geometrical and algebraical manner of considering the subject; and expressly warns the reader, that *his* algebraical symbol expresses the deflection only, and not the variation of the increment of the ordinate. It is therefore in the last degree improbable that he would make this mistake. He most expressly does not; and as to the real mistake, which he corrected in the second edition, the writer of this article has in his possession a manuscript copy of notes and illustrations on the whole *Principia*, written in 1693 by Dr David Gregory, Savilian professor of astronomy at Oxford, at the desire of Mr Newton, as preparatory for a new edition, where he has rectified this and several other mistakes in that work, and says that Mr Newton had seen and approved of the amendments. We mention these particulars, because Mr Bernoulli published an elegant dissertation on this subject in the *Leipfic Acts* in 1713; in which he charges Newton (though with many protestations of admiration and respect) with this mistake in principle; and says, that he communicated his correction to Mr Newton by his nephew Nicholas Bernoulli, that it might be corrected in the new edition, which he heard was in the press. And he afterwards adds, that it appears by some sheets being cancelled, and new ones substituted in this part of the work, that the mistake would have continued, had he not corrected it. We would desire our readers to consult this dissertation, which is extremely elegant, and will be of service to us in this article; and let them compare the civil things which is here said of the *vir incomparabilis*, the *omni laude major*, the *summus Newtonus*, with what the same author, in the same year, in the *Leipfic Acts*, but under a borrowed name, says of him. Our readers will have no hesitation in ascribing this letter to this author. For, after praising John Bernoulli as *summus geometra, natus ad summorum geometrarum paralogismos corrigendos, summi candoris ut et modestie*, he betrays himself by an unguarded warmth, when defending J. B.'s demonstration of the inverse problem of centripetal forces, by calling it *MEAM demonstrationem*.

Let our readers now consider the scope and intention of this dissertation on projectiles, and judge whether the author's aim was to instruct the world, or to acquire fame, by correcting Newton. The dissertation does not contain one theorem, one corollary, nor one step of argument, which is not to be found in Newton's first edition; nor has he gone farther than Newton's single proposition the Xth. To us it appears an exact companion to his proposition on centripetal forces, which he boasts of having first demonstrated, although it is in every step a transcript of the 42d of the 1st Book of Newton's *Principia*, the geometrical language of Newton being changed into algebraic, as he has in the present case changed Newton's algebraic analysis into a very elegant geometrical one.

We hope to be forgiven for this long digression. It is a very curious piece of literary history, and shows the combination which envy and want of honourable principle had formed against the reputation of our illustrious

illustrious countryman; and we think it our duty to embrace any opportunity of doing it justice.—To return to our subject:

13
Accurate
measure of
the accel-
erative pow-
er of gravi-
ty.

The accurate measure of the accelerative power of gravity, is the fall $16\frac{1}{2}$ feet, if we measure it by the space, or the velocity of $32\frac{1}{2}$ feet per second, if we take the velocity. It will greatly facilitate calculation, and will be sufficiently exact for all our purposes, if we take 16 and 32, supposing that a body falls 16 feet in a second, and acquires the velocity of 32 feet per second. Then, because the heights are as the squares of the times, and as the squares of the acquired velocities, a body will fall one foot in one fourth of a second, and will acquire the velocity of eight feet per second. Now let h express the height in feet, and call it the PRODUCING HEIGHT; v the velocity in feet per second, and call it the PRODUCED VELOCITY, the velocity DUE; and t the time in seconds.—We shall have the following formulæ, which are of easy recollection, and will serve, without tables, to answer all the questions relative to projectiles.

$$\text{I. } v = 8\sqrt{h}, = 8 \times 4t, = 32t$$

$$\text{II. } t = \frac{\sqrt{h}}{4}, = \frac{v}{32}$$

$$\text{III. } \sqrt{h} = \frac{v}{8}, = 4t$$

$$\text{IV. } h = \frac{v^2}{64}, = 16t^2$$

15
Examples
of their use
in falling
bodies.

To give some examples of their use, let it be required,

1. To find the time of falling through 256 feet.

Here $h = 256$, $\sqrt{256} = 16$, and $\frac{16}{4} = 4$. Answer 4".

2. To find the velocity acquired by falling four seconds. $t = 4$. $32 \times 4 = 128$ feet per second.

3. To find the velocity acquired by falling 625 feet. $h = 625$. $\sqrt{h} = 25$. $8\sqrt{h} = 2000$ feet per second.

16
In bodies
projected
upwards.

4. To find the height to which a body will rise when projected with the velocity of 56 feet per second, or the height through which a body must fall to acquire this velocity.

$$v = 56 \cdot \frac{56}{8} = 7, = \sqrt{h} \cdot 7^2 = h, = 49 \text{ feet.}$$

$$\text{or } 56^2 = 3136 \cdot \frac{3136}{64} = 49 \text{ feet.}$$

17
And direct-
ly down-
wards.

5. Suppose a body projected directly downwards with the velocity of 10 feet per second; what will be its velocity after four seconds? In four seconds it will have acquired, by the action of gravity, the velocity of 4×32 , or 128 feet, and therefore its whole velocity will be 138 feet per second.

6. To find how far it will have moved, compound its motion of projection, which will be 40 feet in four seconds, with the motion which gravity alone would have given it in that time, which is 256 feet; and the whole motion will be 296 feet.

7. Suppose the body projected as already mentioned, and that it is required to determine the time it will take to go 296 feet downwards, and the velocity it will have acquired.

Find the height x , through which it must fall to acquire the velocity of projection, 10 feet, and the time

of falling from this height. Then find the time z of falling through the height $296 + x$, and the velocity v acquired by this fall. The time of describing the 296 feet will be $z - y$, and v is the velocity required.

From such examples, it is easy to see the way of answering every question of the kind.

Writers on the higher parts of mechanics always compute the actions of other accelerating and retarding forces by comparing them with the acceleration of gravity, and in order to render their expressions more general, use a symbol, such as g for gravity, leaving the reader to convert it into numbers. Agreeably to this view, the general formulæ will stand thus:

$$\text{I. } v = \sqrt{2gh}, \text{ i. e. } \sqrt{2\sqrt{g}\sqrt{h}}, = g t,$$

$$\text{II. } t = \frac{v}{g}, = \frac{\sqrt{4h}}{\sqrt{2g}}, = \sqrt{\frac{4h}{2g}}, = \sqrt{\frac{2h}{g}}$$

$$\text{III. } h = \frac{v^2}{2g}, = \frac{g t^2}{2}$$

In all these equations, gravity, or its accelerating power, is estimated, as it ought to be, by the change of velocity which it generates in a particle of matter in an unit of time. But many mathematicians, in their investigations of curvilinear and other varied motions, measure it by the deflection which it produces in this time from the tangent of the curve, or by the increment by which the space described in an unit of time exceeds the space described in the preceding unit. This is but one half of the increment which gravity would have produced, had the body moved through the whole moment with the acquired addition of velocity. In this sense of the symbol g , the equations stand thus:

$$\text{I. } v = 2\sqrt{gh}, = 2gt$$

$$\text{II. } t = \sqrt{\frac{h}{g}}, = \frac{v}{2g}$$

$$\text{IV. } h = \frac{v^2}{4g}, = g t^2, \text{ and } \sqrt{h} = \frac{v}{2\sqrt{g}}$$

It is also very usual to consider the accelerating force of gravity as the unit of comparison. This renders the expressions much more simple. In this way, v expresses not the velocity, but the height necessary for acquiring it, and the velocity itself is expressed by \sqrt{v} . To reduce such an expression of a velocity to numbers, we must multiply it by $\sqrt{2g}$, or by $2\sqrt{g}$, according as we make g to be the generated velocity, or the space fallen through in the unit of time.

This will suffice for the perpendicular ascents or descents of heavy bodies, and we proceed to consider their projected motions when projected obliquely. The circumstance which renders this an interesting subject, is, that the flight of cannon shot and shells are instances of such motion, and the art of gunnery must in a great measure depend on this doctrine.

Let a body B (fig. 2.), be projected in any direction BC, not perpendicular to the horizon, and with any velocity. Let AB be the height producing this velocity; that is, let the velocity be that which a heavy body would acquire by falling freely through AB. It is required to determine the path of the body, and all the circumstances of its motion in this path?

1. It is evident, that by the continual action of gravity,

18

ral formu-
lae.

19

Bodies
projected
obliquely.Plate
ccccxvii.

20
Describes
a parabola.

vity, the body will be continually deflected from the line BC, and will describe a curve line BVG, concave towards the earth.

2. This curve line is a parabola, of which the vertical line ABE is a diameter, B the vertex of this diameter, and BC a tangent in B.

Through any two points V, G of the curve draw VC, GH parallel to AB, meeting BC in C and H, and draw VE, GK parallel to BC, meeting AB in E, K. It follows, from the composition of motions, that the body would arrive at the points V, G of the curve in the same time that it would have uniformly described BC, BH, with the velocity of projection; or that it would have fallen through BE, BK, with a motion uniformly accelerated by gravity; therefore the times of describing BC, BH, uniformly, are the same with the times of falling through BE, BK. But, because the motion along BH is uniform, BC is to BH as the time of describing BC to the time of describing BH, which we may express thus, $BC : BH = T$, $BC : T$, $BH = T$, $BE : T$, BK . But, because the motion along BK is uniformly accelerated, we have $BE : BK = T^2$, $BE : T^2$, $BK = BC^2 : BH^2 = EV^2 : KG^2$; therefore the curve BVG is such, that the abscissæ BE, BK are as the squares of the corresponding ordinates EV, KG; that is, the curve BVG is a parabola, and BC, parallel to the ordinates, is a tangent in the point B.

3. If through the point A there be drawn the horizontal line AD *d*, it is the directrix of the parabola.

Let BE be taken equal to AB. The time of falling through BE is equal to the time of falling through AB; But BC is described with the velocity acquired by falling through AB; and therefore by n^o 4. of perpendicular descents, BC is double of AB, and EV is double of BE; therefore $EV^2 = 4 BE^2 = 4 BE \times AB = BE \times 4 AB$, and 4 AB is the parameter or *latus rectum* of the parabola BVG, and AB being one-fourth of the parameter, AD is the directrix.

4. The times of describing the different arches BV, VG of the parabola are as the portions BC, BH of the tangent, or as the portions AD, A *d* of the directrix, intercepted by the same vertical lines AB, CV, HG; for the times of describing BV, BVG are the same with those of describing the corresponding parts BC, BH of the tangent, and are proportional to these parts, because the motion along BH is uniform; and BC, BH are proportional to AD, A *d*.

Therefore the motion estimated horizontally is uniform.

5. The velocity in any point G of the curve is the same with that which a heavy body would acquire by falling from the directrix along dG. Draw the tangent GT, cutting the vertical AB in T; take the points *a*, *f*, equidistant from A and *d*, and extremely near them, and draw the verticals *ab*, *fg*; let the points *a*, *f*, continually approach A and *d*, and ultimately coincide with them. It is evident that B *b* will ultimately be to gG, in the ratio of the velocity at B to the velocity at G; for the portions of the tangent ultimately coincide with the portions of the curve, and are described in equal times; but B *b* is to gG as BH to TG: therefore the velocity at B is to that at G as BH to TG. But, by the properties of the parabola, BH² is to

TG² as AB to dG; and AB is to dG as the square of the velocity acquired by falling through AB to the square of the velocity acquired by falling through dG; and the velocity in BH, or in the point B of the parabola, is the velocity acquired by falling along AB; therefore the velocity in TG, or in the point G of the parabola, is the velocity acquired by falling along dG.

These few simple propositions contain all the theory of the motion of projectiles in vacuo, or independent on the resistance of the air; and being a very easy and neat piece of mathematical philosophy, and connected with very interesting practice, and a very respectable profession, they have been much commented on, and have furnished matter for many splendid volumes. But the air's resistance occasions such a prodigious diminution of motion in the great velocities of military projectiles, that this parabolic theory, as it is called, is hardly of any use. A musket-ball, discharged with the ordinary allotment of powder, issues from the piece with the velocity of 1670 feet per second: this velocity would be acquired by falling from the height of eight miles. If the piece be elevated to an angle of 45°, the parabola should be of such extent that it would reach 16 miles on the horizontal plain; whereas it does not reach much above half a mile. Similar deficiencies are observed in the ranges of cannon shot.

We do not propose, therefore, to dwell much on this theory, and shall only give such a synoptical view of it, as shall make our readers understand the more general circumstances of the theory, and be masters of the language of the art.

Let OB (fig. 3.) be a vertical line. About the centres A and B, with the distance AB, describe the semicircles ODB, AHK, and with the axis AB, and semiaxis GE, equal to AB, describe the semi-ellipse AEB: with the focus B, vertex A, diameter AB, and tangent AD, parallel to the horizon, describe the parabola APS.

Let a body be projected from B, in any direction BC, with the velocity acquired by falling through AB. By what has already been demonstrated, it will describe a parabola BVPM. Then,

1. ADL parallel to the horizon is the directrix of every parabola which can be described by a body projected from B with this velocity. This is evident.

2. The semicircle AHK is the locus of all the foci of these parabolas: For the distance BH of a point B of any parabola from the directrix AD is equal to its distance BF from the focus F of that parabola; therefore the foci of all the parabolas which pass through B, and have AD for their directrix, must be in the circumference of the circle which has AB for its radius, and B for its centre.

3. If the line of direction BC cut the upper semicircle in C, and the vertical line CF be drawn, cutting the lower semicircle in F, F is the focus of the parabola BVPM, described by the body which is projected in the direction BC, with the velocity acquired by falling through BA: for drawing AC, BF, it is evident that ACFB is a rhombus, and that the angle ABF is bisected by BC, and therefore the focus lies in the line BF; but it also lies in the circumference AFK, and therefore in F.

If C is in the upper quadrant of ODB, F is in the upper

21
The parabolic theory ingenious, but of little use in practice.

22
A short view of it,

Plate
ccccxviii.

upper quadrant of AFK; and if C be in the lower quadrant of ODB (as when BC is the line of direction) then the focus of the corresponding parabola B v M is in the lower quadrant of AHK, as at *f*.

4. The ellipsis AEB is the locus of the vertex of all the parabolas, and the vertex V of any one of them BVPM is in the intersection of this ellipsis with the vertical CF: for let this vertical cut the horizontal lines AD, GE, BN, in θ , λ , N. Then it is plain that $N\lambda$ is half of $N\theta$, and λV is half of $C\theta$; therefore NV is half of NC, and V is the vertex of the axis.

If the focus is in the upper or lower quadrant of the circle AHK, the vertex is in the upper or the lower quadrant of the ellipse AEG.

5. If BFP be drawn through the focus of any one of the parabolas, such as BVM, cutting the parabola APS in P, the parabola BVM touches the parabola APS in P: for drawing $P\delta$ parallel to AB, cutting the directrix O α of the parabola APS in α , and the directrix AL of the parabola BVM in δ , then $PB = P\alpha$; but $BF = BA$, $= AO$, $= \alpha\delta$: therefore $P\delta = PF$, and the point P is in the parabola BVM. Also the tangents to both parabolas in P coincide, for they bisect the angle αPB ; therefore the two parabolas having a common tangent, touch each other in P.

Cor. All the parabolas which can be described by a body projected from B, with the velocity acquired by falling through AB, will touch the concavity of the parabola APS, and lie wholly within it.

6. P is the most distant point of the line BP which can be hit by a body projected from B with the velocity acquired by falling through AB. For if the direction is more elevated than BC, the focus of the parabola described by the body will lie between F and A, and the parabola will touch APS in some point between P and A; and being wholly within the parabola APS, it must cut the line BP in some point within P. The same thing may be shown when the direction is less elevated than BC.

7. The parabola APS is the locus of the greatest ranges on any planes BP, BS, &c. and no point lying without this parabola can be struck.

8. The greatest range on any plane BP is produced when the line of direction BC bisects the angle OBP formed by that plane with the vertical: for the parabola described by the body in this case touches APS in P, and its focus is in the line BP, and therefore the tangent BC bisects the angle OBP.

Cor. The greatest range on a horizontal plane is made with an elevation of 45° .

9. A point M in any plane BS, lying between B and S, may be struck with two directions, BC and Bc; and these directions are equidistant from the direction Bt, which gives the greatest range on that plane: for if about the centre M, with the distance ML from the directrix AL, we describe a circle LEf, it will cut the circle AHK in two points F and *f*, which are evidently the foci of two parabolas BVM, B v M, having the directrix AL and diameter ABK. The intersection of the circle ODB, with the verticals FC, *f*c, determine the directions BC, Bc of the tangents. Draw At parallel to BS, and join tB, Cc, F*f*; then $OBt = \frac{1}{2} OBS$, and Bt is the direction which gives the greatest range on the plane BS: but because F*f* is a chord of the circles described round the centres B and

M, F*f* is perpendicular to BM, and Cc to At, and the arches Ct, ct are equal; and therefore the angles CBt, cBt are equal.

Thus we have given a general view of the subject, which shows the connection and dependence of every circumstance which can influence the result; for it is evident that to every velocity of projection there belongs a set of parabolas, with their directions and ranges; and every change of velocity has a line AB corresponding to it, to which all the others are proportional. As the height necessary for acquiring any velocity increases or diminishes in the duplicate proportion of that velocity, it is evident that all the ranges with given elevations will vary in the same proportion; a double velocity giving a quadruple range, a triple velocity giving a nonuple range, &c. And, on the other hand, when the ranges are determined beforehand (which is the usual case), the velocities are in the subduplicate proportion of the ranges. A quadruple range will require a double velocity, &c.

On the principles now established is founded the ordinary theory of gunnery, furnishing rules which are to direct the art of throwing shot and shells, so as to hit the mark with a determined velocity.

23
Experience principally directs the practical gunner.

But we must observe, that this theory is of little service for directing us in the practice of cannonading. Here it is necessary to come as near as we can to the object aimed at, and the hurry of service allows no time for geometrical methods of pointing the piece after each discharge. The gunner either points the cannon directly to the object, when within 200 or 300 yards of it, in which case he is said to shoot point blank (*pointer au blanc*, i. e. at the white mark in the middle of the gunners target); or, if at a greater distance, he estimates to the best of his judgment the deflection corresponding to his distance, and points the cannon accordingly. In this he is aided by the greater thickness at the breech of a piece of ordnance. Or, lastly, when the intention is not to batter, but to rake along a line occupied by the enemy, the cannon is elevated at a considerable angle, and the shot discharged with a small force, so that it drops into the enemy's post, and bounds along the line. In all these services the gunner is directed entirely by trial, and we cannot say that this parabolic theory can do him any service.

The principal use of it is to direct the bombardier in throwing shells. With these it is proposed to break down or set fire to buildings, to break through the vaulted roofs of magazines, or to intimidate and kill troops by bursting among them. These objects are always under cover of the enemy's works, and cannot be touched by a direct shot. The bombs and carcasses are therefore thrown upwards, so as to get over the defences and produce their effect.

These shells are of very great weight, frequently exceeding 200 lbs. The mortars from which they are discharged must therefore be very strong, that they may resist the explosion of gunpowder which is necessary for throwing such a mass of matter to a distance; they are consequently unwieldy, and it is found most convenient to make them almost a solid and immoveable lump. Very little change can be made in their elevation, and therefore their ranges are regulated by the velocities given to the shell. These again are produced by the quantities of

P R O J E C T I L E S.

of powder in the charge; and experience (confirming the best theoretical notions that we can form of the subject) has taught us, that the ranges are nearly proportional to the quantities of powder employed, only not increasing quite so fast. This method is much easier than by differences of elevation; for we can select the elevation which gives the greatest range on the given plane, and then we are certain that we are employing the smallest quantity of powder with which the service can be performed: and we have another advantage, that the deviations which unavoidable causes produce in the real directions of the bomb will then produce the smallest possible deviation from the intended range. This is the case in most mathematical maxima.

24
The moving force in theory different from that in practice.

Plate
ccccxvii.

In military projectiles the velocity is produced by the explosion of a quantity of gunpowder: but in our theory it is conceived as produced by a fall from a certain height, by the proportions of which we can accurately determine its quantity. Thus a velocity of 1600 feet per second is produced by a fall from the height of 40,000 feet or 1333 yards.

The height CA (fig. 4.) for producing the velocity of projection is called, in the language of gunnery, the IMPETUS. We shall express it by the symbol *b*.

The distance AB to which the shell goes on any plane AB, is called the AMPLITUDE or the RANGE *r*.

The angle DBA, made by the vertical line and the plane AB, may be called the angle of POSITION of that plane, *p*.

The angle DAB, made by the axis or direction of the piece, and the direction of the object, may be called the angle of ELEVATION of the piece above the plane AB, *e*.

The angle ZAD, made by the vertical line, and the direction of the piece, may be called the ZENITH distance, *z*.

The relations between all the circumstances of velo-

city, distance, position, elevation, and time, may be included in the following propositions.

I. Let a shell be projected from A, with the velocity acquired by falling through CA, with the intention of hitting the mark B situated in the given line AB. Make ZA=4AC, and draw BD perpendicular to the horizon. Describe on ZA an arch of a circle ZDA, containing an angle equal to DBA, and draw AD to the intersection of this circle with DB; then will a body projected from A, in the direction AD, with the velocity acquired by falling through CA, hit the mark B.

For, produce CA downwards, and draw BF parallel to AD, and draw ZD. It is evident from the construction that AB touches the circle in B, and that the angles ADZ, DBA, are equal, as also the angles AZD, DAB; therefore the triangles ZAD, ADB are similar.

Therefore BD : DA = DA : AZ,

And DA² = BD × AZ;

Therefore BF² = AF × AZ, = AF × 4 AC.

Therefore a parabola, of which AF is a diameter, and AZ its parameter, will pass through B, and this parabola will be the path of the shell projected as already mentioned.

Remark. When BD cuts this circle, it cuts it in two points D, *d*; and there are two directions which will solve the problem. If BD only touches the circle in D', there is but one direction, and AB' is the greatest possible range with this velocity. If the vertical line through B does not meet the circle, the problem is impossible, the velocity being too small. When B'D' touches the circle, the two directions AD' and A*d* coalesce into one direction, producing the greatest range, and bisecting the angle ZAB; and the other two directions AD, A*d*, producing the same range AB, are equidistant from AD', agreeably to the general proposition.

It is evident that AZ : AD = S, ADZ : S, AZD, = S, DBA : S, DAB, = S, *p* : S, *e*

And AD : DB = S, DBA : S, DAB, = S, *p* : S, *e*

And DB : AB = S, DAB : S, ADB, = S, *e* : S, *z*

Therefore AZ : AB = S², *p* × S², *e* : S², *e* × S, *z*; = S², *p* : S, *e* × S, *z*

Or 4 *b* : *r* = S², *p* : S, *e* × S, *z*, and 4 *b* × S, *e* × S, *z* = *r* × S², *p*

Hence we obtain the relations wanted.

Thus *b* = $\frac{r \times S^2, p}{4 S, e \times S, z}$, and *r* = $\frac{4 b \times S, e \times S, z}{S^2, p}$

And S, *z* = $\frac{r \times S^2, p}{4 b \times S, e}$, and S, *e* = $\frac{r \times S^2, p}{4 b \times S, z}$

26
To calculate the time of flight.

The only other circumstance in which we are interested is the time of the flight. A knowledge of this is necessary for the bombardier, that he may cut the fuzes of his shells to such lengths as that they may burst at the very instant of their hitting the mark.

Now AB : DB = Sin, ADB : Sin, DAB, = S, *z* : S, *e*, and DB = $\frac{r \times S, e}{S, z}$. But the time of the flight is the same with the time of falling through DB, and 16 feet : DB = 1" : *t*". Hence *t*"² = $\frac{r \times S, e}{16 S, z}$, and we have the following easy rule.

From the sum of the logarithms of the range, and of the sine of elevation, subtract the sum of the logarithms of 16, and of the sine of the zenith distance, half the remainder is the logarithm of the time in seconds.

VOL. XV.

This becomes still easier in practice; for the mortar should be so elevated that the range is a maximum: in which case AB=DB, and then half the difference of the logarithms of AB and of 16 is the logarithm of the time in seconds.

Such are the deduction from the general propositions which constitute the ordinary theory of gunnery. It remains to compare them with experiment.

In such experiments as can be performed with great accuracy in a chamber, the coincidence is as great as can be wished. A jet of water, or mercury, gives us the finest example, because we have the whole parabola exhibited to us in the simultaneous places of the succeeding particles. Yet even in these experiments a deviation can be observed. When the jet is made on a horizontal plane, and the curve carefully traced on a perpendicular plane held close by it, it is found that the distance between the highest point of the curve and the mark is less than the distance between it and the spout, and that the descending branch of the curve is more perpendicular than the ascending branch. And this difference is more remarkable as the jet is made with

27
The theory of gunnery compared with experiment.

3 Z

greater

PROJECTILES.

greater velocity, and reaches to a greater distance. This is evidently produced by the resistance of the air, which diminishes the velocity, without affecting the gravity of the projectile. It is still more sensible in the motion of bombs. These can be traced through the air by the light of their fuzes; and we see that their highest point is always much nearer to the mark than to the mortar on a horizontal plane.

The greatest horizontal range on this plane should be when the elevation is 45° . It is always found to be much lower.

The ranges on this plane should be as the sines of twice the elevation.

A ball discharged at the elev. $19^\circ. 5'$ ranged 448 yards

at $9. 45$ 330

It should have ranged by theory 241

The range at an elevation of 45° should be twice the impetus. Mr Robins found that a musket-ball, discharged with the usual allotment of powder, had the velocity of 1700 feet in a second. This requires a fall of 45156 feet, and the range should be 90312, or $17\frac{1}{2}$ miles; whereas it does not much exceed half a mile. A 29 pound ball discharged with 16 pounds of powder should range about 16 miles; whereas it is generally short of 3 miles.

28
This comparison shews the deficiency of the theory.

Such facts show incontrovertibly how deficient the parabolic theory is, and how unfit for directing the practice of the artillerist. A very simple consideration is sufficient for rendering this obvious to the most uninstructed. The resistance of the air to a very light body may greatly exceed its weight. Any one will feel this in trying to move a fan very rapidly through the air; therefore this resistance would occasion a greater deviation from uniform motion than gravity would *in that body*. Its path, therefore, through the air may differ more from a parabola than the parabola itself deviates from the straight line.

It is for such cogent reasons that we presume to say, that the voluminous treatises which have been published on this subject are nothing but ingenious amusements for young mathematicians. Few persons who have been much engaged in the study of mechanical philosophy have missed this opportunity in the beginning of their studies. The subject is easy. Some property of the parabola occurs, by which they can give a neat and systematic solution of all the questions; and at this time of study it seems a considerable essay of skill. They are tempted to write a book on the subject; and it finds readers among other young mechanicians, and employs all the mathematical knowledge that most of the young gentlemen of the military profession are possessed of. But these performances deserve little attention from the practical artillerist. All that seems possible to do for his education is, to multiply judicious experiments on real pieces of ordnance, with the charges that are used in actual service, and to furnish him with tables calculated from such experiments.

These observations will serve to justify us for having given so concise an account of this doctrine of the parabolic flight of bodies.

29
Causes of this deficiency.

But it is the business of a philosopher to inquire into the causes of such a prodigious deviation from a well founded theory, and having discovered them, to ascertain precisely the deviation they occasion. Thus we shall obtain another theory, either in the form of the parabolic

theory corrected, or as a subject, of independent discussion. This we shall now attempt.

The motion of projectiles is performed in the atmosphere. The air is displaced, or put in motion. Whatever motion it acquires must be taken from the bullet. The motion communicated to the air must be in the proportion of the quantity of air put in motion, and of the velocity communicated to it. If, therefore, the displaced air be always *similarly displaced*, whatever be the velocity of the bullet, the motion communicated to it, and lost by the bullet, must be proportional to the square of the velocity of the bullet and to the density of the air jointly. Therefore the diminution of its motion must be greater when the motion itself is greater, and in the very great velocity of shot and shells it must be prodigious. It appears from Mr Robins's experiments that a globe of $4\frac{1}{2}$ inches in diameter, moving with the velocity of 25 feet in a second, sustained a resistance of 315 grains, nearly $\frac{1}{4}$ of an ounce. Suppose this ball to move 800 feet in a second, that is 32 times faster, its resistance would be 32×32 times $\frac{1}{4}$ of an ounce, or 768 ounces or 48 pounds. This is four times the weight of a ball of cast iron of this diameter; and if the initial velocity had been 1600 feet per second, the resistance would be at least 16 times the weight of the ball. It is indeed much greater than this.

30
Effect of the atmosphere.

This resistance, operating constantly and uniformly on the ball, must take away four times as much from its velocity as its gravity would do in the same time. We know that in one second gravity would reduce the velocity 800 to 768 if the ball were projected straight upwards. This resistance of the air would therefore reduce it in one second to 672, if it operated uniformly: but as the velocity diminishes continually by the resistance, and the resistance diminishes along with the velocity, the real diminution will be somewhat less than 128 feet. We shall, however, see afterwards that in one second its velocity will be reduced from 800 to 687. From this simple instance we see that the resistance of the air must occasion great deviation from parabolic motion.

31
Compared with that of gravity.

In order to judge accurately of its effect, we must consider it as a retarding force, in the same way as we consider gravity. The weight W of a body is the aggregate of the action of the force of gravity g on each particle of the body. Suppose the number of equal particles, or the quantity of matter, of a body to be M , then W is equivalent to gM . In like manner, the resistance R , which we observe in any experiment, is the aggregate of the action of a retarding force R' on each particle, and is equivalent to $R'M$: and as g is equal to $\frac{W}{M}$, so R' is equal to $\frac{R}{M}$. We shall keep this distinction in view, by adding the differential mark ' to the letter R or r , which expresses the aggregate resistance.

32
And considered as a retarding force.

If we, in this manner, consider resistance as a retarding force, we can compare it with any other such force by means of the retardation which it produces in similar circumstances. We would compare it with gravity by comparing the diminution of velocity which its uniform action produces in a given time with the diminution produced in the same time by gravity. But we have no opportunity of doing this directly; for when the resistance of the air diminishes the velocity of a body, it diminishes it gradually, which occasions a gradual diminution of its own

33
The resistance of the air is not uniform.

own intensity. This is not the case with gravity, which has the same action on a body in motion or at rest. We cannot, therefore, observe the uniform action of the air's resistance as a retarding force. We must fall on some other way of making the comparison. We can state them both as dead pressures. A ball may be fitted to the rod of a spring stillyard, and exposed to the impulse of the wind. This will compress the stillyard to the mark 3, for instance. Perhaps the weight of the ball will compress it to the mark 6. We know that half this weight would compress it to 3. We account this equal to the pressure of the air, because they balance the same elasticity of the spring. And in this way we can estimate the resistance by weights, whose pressures are equal to its pressure, and we can thus compare it with other resistances, weights, or any other pressures. In fact, we are measuring them all by the elasticity of the spring. This elasticity in its different positions is supposed to have the proportions of the weights which keep it in these positions. Thus we reason from the nature of gravity, no longer considered as a dead pressure, but as a retarding force; and we apply our conclusions to resistances which exhibit the same pressures, but which we cannot make to act uniformly. This sense of the words must be carefully remembered whenever we speak of resistances in pounds and ounces.

34
Gravity
and resist-
ance com-
pared when
they are
equal.

The most direct and convenient way of stating the comparison between the resistance of the air and the accelerating force of gravity, is to take a case in which we know that they are equal. Since the resistance is here assumed as proportional to the square of the velocity, it is evident that the velocity may be so increased that the resistance shall equal or exceed the weight of the body. If a body be already moving downwards with this velocity, it cannot accelerate; because the accelerating force of gravity is balanced by an equal retarding force of resistance. It follows from this remark, that this velocity is the greatest that a body can acquire by the force of gravity only. Nay, we shall afterwards see that it never can completely attain it; because as it approaches to this velocity, the remaining accelerating force decreases faster than the velocity increases. It may therefore be called the limiting or **TERMINAL** velocity by gravity.

Let a be the height through which a heavy body must fall, in vacuo, to acquire its terminal velocity in air. If projected directly upwards with this velocity, it will rise again to this height, and the height is half the space which it would describe uniformly, with this velocity, in the time of its ascent. Therefore the resistance to this velocity being equal to the weight of the body, it would extinguish this velocity, by its *uniform* action, in the same time, and after the same distance, that gravity would.

Now let g be the velocity which gravity generates or extinguishes during an unit of time, and let u be the terminal velocity of any particular body. The theorems for perpendicular ascents give us $g = \frac{u^2}{2a}$, u and a being both numbers representing units of space; therefore, in the present case, we have $r' = \frac{u^2}{2a}$. For the whole resistance r , or $r' M$, is supposed equal to the weight, or to $g M$; and therefore r' is equal to g , $= \frac{u^2}{2a}$ and $2a =$

$\frac{u^2}{g}$. There is a consideration which ought to have place here. A body descends in air, not by the whole of its weight, but by the excess of its weight above that of the air which it displaces. It descends by its *specific* gravity only as a stone does in water. Suppose a body 32 times heavier than air, it will be buoyed up by a force equal to $\frac{1}{32}$ of its weight; and instead of ac-

quiring the velocity of 32 feet in a second, it will only acquire a velocity of 31, even though it sustained no resistance from the *inertia* of the air. Let p be the weight of the body and π that of an equal bulk of air: the accelerative force of relative gravity on each particle will be $g \times 1 - \frac{\pi}{p}$; and this relative accelerating force might be distinguished by another symbol γ . But in all cases in which we have any interest, and particularly in military projectiles, $\frac{\pi}{p}$ is so small a quantity that it would be pedantic affectation to attend to it. It is much more than compensated when we make $g = 32$ feet instead of $32\frac{1}{32}$ which it should be.

Let e be the time of this ascent in opposition to gravity. The same theorems give us $e u = 2a$; and since the resistance competent to this terminal velocity is equal to gravity, e will also be the time in which it would be extinguished by the uniform action of the resistance; for which reason we may call it the extinguishing time for this velocity. Let R and E mark the resistance and extinguishing time for the same body moving with the velocity 1.

Since the resistances are as the squares of the velocities, and the resistance to the velocity u is $\frac{u^2}{2a}$, R will be $= \frac{1}{2a}$. Moreover, the times in which the same velocity will be extinguished by different forces, acting uniformly, are inversely as the forces, and gravity would extinguish the velocity 1 in the time $\frac{1}{g}$, $=$ (in these measures) $\frac{1}{u^2} = \frac{2a}{u^2}$. Therefore we have the following proportion $\frac{1}{2a} (=R) : \frac{u^2}{2a} (=g) = \frac{2a}{u^2} : 2a$, and $2a$ is equal to

E , the time in which the velocity 1 will be extinguished by the uniform action of the resistance competent to this velocity.

The velocity 1 would in this case be extinguished after a motion uniformly retarded, in which the space described is one-half of what would be uniformly described during the same time with the constant velocity 1. Therefore the space thus described by a motion which begins with the velocity 1, and is uniformly retarded by the resistance competent to this velocity, is equal to the height through which *this* body must fall in *vacuo* in order to acquire its terminal velocity in air.

All these circumstances may be conceived in a manner which, to some readers, will be more familiar and palpable. The terminal velocity is that where the resistance of the air balances and is equal to the weight of the body. The resistance of the air to any particular body is as the square of the velocity; therefore let R be the whole resistance to the body moving with the velocity

1, and r the resistance to its motion with the terminal velocity u ; we must have $r = R \times u^2$, and this must be $= W$ the weight. Therefore, to obtain the terminal velocity, divide the weight by the resistance to the velocity 1, and the quotient is the square of the terminal velocity, or $\frac{W}{R} = u^2$: And this is a very expeditious method of determining it, if R be previously known.

Then the common theorems give a , the fall necessary for producing this velocity in *vacuo* $= \frac{u^2}{2g}$, and the time of the fall $= \frac{u}{g} = e$, and $eu = 2a$, $=$ the space uniformly

described with the velocity u during the time of the fall, or its equal, the time of the extinction by the uniform action of the resistance r ; and, since r extinguishes it in the time e , R , which is u^2 times smaller, will extinguish it in the time $u^2 e$, and R will extinguish the velocity 1, which is u times less than u , in the time $u e$, that is, in the time $2a$; and the body, moving uniformly during the time $2a$, $= E$, with the velocity 1, will describe the space $2a$; and, if the body begin to move with the velocity 1, and be uniformly opposed by the resistance R , it will be brought to rest when it has described the space a ; and the space in which the resistance to the velocity 1 will extinguish that velocity by its uniform action, is equal to the height through which that body must fall in *vacuo* in order to acquire its terminal velocity in air. And thus every thing is regulated by the time E in which the velocity 1 is extinguished by the uniform action of the corresponding resistance, or by $2a$, which is the space uniformly described during this time, with the velocity 1. And E and $2a$ must be expressed by the same number. It is a number of units, of time, or of length.

33
The comparison made general.

Having ascertained these leading circumstances for an unit of velocity, weight, and bulk, we proceed to deduce the similar circumstances for any other magnitude; and, to avoid unnecessary complications, we shall always suppose the bodies to be spheres, differing only in diameter and density.

First, then, let the velocity be increased in the ratio of 1 to v .

The resistance will now be $\frac{v^2}{2a} = r$.

The extinguishing time will be $\frac{E}{v} = e$, $= \frac{2a}{v}$, and $e v = 2a$; so that the rule is general, that the space along which any velocity will be extinguished by the uniform action of the corresponding resistance, is equal to the height necessary for communicating the terminal velocity to that body by gravity. For $e v$ is twice the space through which the body moves while the velocity v is extinguished by the uniform resistance.

In the 2d place, let the diameter increase in the proportion of 1 to d . The aggregate of the resistance changes in the proportion of the surface similarly resisted, that is, in the proportion of 1 to d^2 . But the quantity of matter, or number of particles among which this resistance is to be distributed, changes in the proportion of 1 to d^3 . Therefore the retarding power of the resistance changes in the proportion of 1 to $\frac{1}{d}$. When the diameter was 1, the resistance to a velocity 1 was $\frac{1}{2a}$. It must now

be $\frac{1}{2ad}$. The time in which this diminished resistance will extinguish the velocity 1 must increase in the proportion of the diminution of force, and must now be $E d$, or $2ad$, and the space uniformly described during this time with the initial velocity 1 must be $2ad$; and this must still be twice the height necessary for communicating the terminal velocity w to this body.

We must still have $g = \frac{w^2}{2ad}$; and therefore $w^2 = 2gad$,

and $w = \sqrt{2gad} = \sqrt{2ga} \sqrt{d}$. But $u = \sqrt{2ga}$. Therefore the terminal velocity w for this body is $= u \sqrt{d}$; and the height necessary for communicating it is $a d$. Therefore the terminal velocity varies in the subduplicate ratio of the diameter of the ball, and the fall necessary for producing it varies in the simple ratio of the diameter. The extinguishing time for the velocity v must now be $\frac{E d}{v}$.

If, in the 3d place, the density of the ball be increased in the proportion of 1 to m , the number of particles among which the resistance is to be distributed is increased in the same proportion, and therefore the retarding force of the resistance is equally diminished; and if the density of the air is increased in the proportion of 1 to n , the retarding force of the resistance increases in the same proportion: hence we easily deduce these general expressions.

The terminal velocity $= u \sqrt{\frac{dm}{n}} = \sqrt{2gad \frac{m}{n}}$.

The producing fall in *vacuo* $= a d \frac{m}{n}$.

The retarding power of resistance to any velocity $= r' = \frac{v^2}{2ad \frac{m}{n}}$.

The extinguishing time for any velocity $v = \frac{E d m}{v n}$.

And thus we see that the chief circumstances are regulated by the terminal velocity, or are conveniently referred to it.

To render the deductions from these premises perspicuous, and for communicating distinct notions or ideas, it will be proper to assume some convenient units, by which all these quantities may be measured; and, as this subject is chiefly interesting in the case of military projectiles, we shall adapt our units to this purpose. Therefore, let a second be the unit of time, a foot the unit of space and velocity, an inch the unit of diameter of a ball or shell, and a pound avoirdupoise the unit of pressure, whether of weight or of resistance; therefore g is 32 feet.

The great difficulty is to procure an absolute measure of r , or u , or a ; any one of these will determine the others.

Sir Isaac Newton has attempted to determine r by theory, and employs a great part of the second book of the *Principia* in demonstrating, that the resistance to a sphere moving with any velocity is to the force which would generate or destroy its whole motion in the time that it would uniformly move over $\frac{2}{3}$ of its diameter with this velocity as the density of the air is to the density of the sphere. This is equivalent to demonstrating that the resistance of the air to a sphere moving through it with any velocity, is equal to half the weight of a column

36
Units necessary by which the quantities may be measured.

37
Sir Isaac Newton's endeavours in this way.

column of air having a great circle of the sphere for its base, and for its altitude the height from which a body must fall *in vacuo* to acquire this velocity. This appears from Newton's demonstration; for, let the specific gravity of the air be to that of the ball as 1 to m ; then, because the times in which the same velocity will be extinguished by the uniform action of different forces are inversely as the forces, the resistance to this velocity would extinguish it in the time of describing $\frac{3}{2} m d$, d being the diameter of the ball. Now 1 is to m as the weight of the displaced air to the weight of the ball, or as $\frac{2}{3}$ of the diameter of the ball to the length of a column of air of equal weight. Call this length a ; a is therefore equal to $\frac{2}{3} m d$. Suppose the ball to fall from the height a in the time t , and acquire the velocity u . If it moved uniformly with this velocity during this time, it would describe a space $= 2 a$, or $\frac{4}{3} m d$. Now its weight would extinguish this velocity, or destroy this motion, in the same time, that is, in the time of describing $\frac{4}{3} m d$; but the resistance of the air would do this in the time of describing $\frac{8}{3} m d$; that is, in twice the time. The resistance therefore is equal to half the weight of the ball, or to half the weight of the column of air whose height is the height producing the velocity. But the resistance to different velocities are as the squares of the velocities; and therefore, as their producing heights, and, in general, the resistance of the air to a sphere moving with any velocity, is equal to the half weight of a column of air of equal section, and whose altitude is the height producing the velocity. The result of this investigation has been acquiesced in by all Sir Isaac Newton's commentators. Many faults have indeed been found with his reasoning, and even with his principles; and it must be acknowledged that although this investigation is by far the most ingenious of any in the *Principia*, and sets his acuteness and address in the most conspicuous light, his reasoning is liable to serious objections, which his most ingenious commentators have not completely removed. However, the conclusion has been acquiesced in, as we have already stated, but as if derived from other principles, or by more logical reasoning. We cannot, however, say that the reasonings or assumptions of these mathematicians are much better than Newton's: and we must add that all the causes of deviation from the duplicate ratio of the velocities, and the causes of increased resistance, which the later authors have valued themselves for discovering and introducing into their investigations, were pointed out by Sir Isaac Newton, but purposely omitted by him, in order to facilitate the discussion *in re difficillima*. (See *Schol. prop. 37. b. ii.*)

It is known that the weight of a cubic foot of water is $62\frac{1}{2}$ pounds, and that the medium density of the air is $\frac{1}{840}$ of water; therefore let a be the height producing the velocity (in feet), and d the diameter of the ball (in inches), and π the periphery of a circle whose diameter is 1; the resistance of the air will be $= \frac{62\frac{1}{2}}{840} \times \frac{\pi}{4}$
 $\times \frac{1}{144} \times \frac{a}{2} \times d^2 = \frac{a d^2}{4928\frac{1}{2}}$ pounds, very nearly, $=$
 $\frac{v^2}{4928\frac{1}{2} \times 64} d^2 = \frac{v^2 d^2}{315417}$ pounds.

We may take an example. A ball of cast iron weighing 12 pounds, is $4\frac{1}{2}$ inches in diameter. Suppose this

ball to move at the rate of $25\frac{1}{10}$ feet in a second (the reason of this choice will appear afterwards). The height which will produce this velocity in a falling body is $9\frac{7}{8}$ feet. The area of its great circle is 0.11044 feet, or $\frac{11044}{1000000}$ of one foot. Suppose water to be 840 times heavier than air, the weight of the air incumbent on this great circle, and $9\frac{7}{8}$ feet high, is 0.081151 pounds: half of this is 0.0405755 or $\frac{405755}{100000000}$ or nearly $\frac{1}{25}$ of a pound. This should be the resistance of the air to this motion of the ball.

In all matters of physical discussion, it is prudent to confront every theoretical conclusion with experiment. This is particularly necessary in the present instance, because the theory on which this proposition is founded is extremely uncertain. Newton speaks of it with the most cautious diffidence, and secures the justness of the conclusions by the conditions which he assumes in his investigation. He describes with the greatest precision the state of the fluid in which the body must move, so as that the demonstration may be strict, and leaves it to others to pronounce whether this is the real constitution of our atmosphere. It must be granted that it is not; and that many other suppositions have been introduced by his commentators and followers, in order to suit his investigation (for we must assert that little or nothing has been added to it) to the circumstances of the case.

Newton himself, therefore attempted to compare his propositions with experiment. Some were made by dropping balls from the dome of St Paul's cathedral; and all these showed as great a coincidence with his theory as they did with each other: but the irregularities were too great to allow him to say with precision what was the resistance. It appeared to follow the proportion of the squares of the velocities with sufficient exactness; and though he could not say that the resistance was equal to the weight of the column of air having the height necessary for communicating the velocity, it was always equal to a determinate part of it; and might be stated $= n a$, n being a number to be fixed by numerous experiments.

One great source of uncertainty in his experiments seems to have escaped his observation: the air in that dome is almost always in a state of motion. In the summer season there is a very sensible current of air downwards, and frequently in winter it is upwards; and this current bears a very great proportion to the velocity of the descents. Sir Isaac takes no notice of this.

He made another set of experiments with pendulums; and has pointed out some very curious and unexpected circumstances of their motions in a resisting medium. There is hardly any part of his noble work in which his address, his patience, and his astonishing penetration, appear in greater lustre. It requires the utmost intenseness of thought to follow him in these disquisitions; and we cannot enter on the subject at present: some notice will be taken of these experiments in the article *RESISTANCE of Fluids*. Their results were much more uniform, and confirmed his general theory; and, as we have said above, it has been acquiesced in by the first mathematicians of Europe.

But the deductions from this theory were so inconsistent with the observed motions of military projectiles, when the velocities are prodigious, that no application could be made which could be of any service for determining

mining the path and motion of cannon shot and bombs ; and although Mr John Bernoulli gave in 1718 a most elegant determination of the trajectory and motion of a body projected in a fluid which resists in the duplicate ratio of the velocities (a problem which even Newton did not attempt), it has remained a dead letter. Mr Benjamin Robins, equally eminent for physical science and mathematical genius, was the first who suspected the true cause of the imperfection of the usually received theories ; and in 1737 he published a small tract, in which he showed clearly, that even the Newtonian theory of resistance must cause a cannon ball, discharged with a full allotment of powder, to deviate farther from the parabola, in which it would move *in vacuo*, than the parabola deviates from a straight line. But he farther asserted, on the authority of good reasoning, that in such great velocities the resistance must be much greater than this theory assigns ; because, besides the resistance arising from the *inertia* of the air which is put in motion by the ball, there must be a resistance arising from a condensation of the air on the anterior surface of the ball, and a rarefaction behind it : and there must be a third resistance, arising from the statical pressure of the air on its anterior part, when the motion is so swift that there is a vacuum behind. Even these causes of disagreement with the theory had been foreseen and mentioned by Newton (see the Scholium to prop. 37, Book II. *Princip.*) ; but the subject seems to have been little attended to. The eminent mathematicians had few opportunities of making experiments ; and the professional men, who were in the service of princes, and had their countenance and aid in this matter, were generally too deficient in mathematical knowledge to make a proper use of their opportunities. The numerous and splendid volumes which these gentlemen have been enabled to publish by the patronage of sovereigns are little more than prolix extensions of the simple theory of Galileo. Some of them, however, such as St Remy, Antonini, and Le Blond, have given most valuable collections of experiments, ready for the use of the profound mathematician.

43
Observa-
tions of Mr
Robins on
velocity
and resist-
ance,

Two or three years after this first publication, Mr Robins hit upon that ingenious method of measuring the great velocities of military projectiles, which has handed down his name to posterity with great honour. And having ascertained these velocities, he discovered the prodigious resistance of the air, by observing the diminution of velocity which it occasioned. This made him anxious to examine what was the real resistance to any velocity whatever, in order to ascertain what was the law of its variation ; and he was equally fortunate in this attempt. His method of measuring the resistance has been fully described in the article GUNNERY, n° 9, &c.

It appears (Robins's *Math. Works*, vol. i. page 205.) that a sphere of $4\frac{1}{2}$ inches in diameter, moving at the rate of $25\frac{1}{2}$ feet in a second, sustained a resistance of 0.04914 pounds, or $\frac{4914}{100000}$ of a pound. This is a greater resistance than that of the Newtonian theory, which gave $\frac{405755}{1000000}$ in the proportion of 1000 to 1211, or very nearly in the proportion of five to six in small numbers. And we may adopt as a rule in all moderate velocities, that the resistance to a sphere is equal to $\frac{6}{100}$ of the weight of a column of air having the great circle of the sphere for its base, and for its altitude the height through which a heavy body must fall *in vacuo* to acquire the velocity of projection.

This experiment is peculiarly valuable, because, the ball is precisely the size of a 12 pound shot of cast iron, and its accuracy may be depended on. There is but one source of error. The whirling motion must have occasioned some whirl in the air, which would continue till the ball again passed through the same point of its revolution. The resistance observed is therefore probably somewhat less than the true resistance to the velocity of $25\frac{1}{2}$ feet, because it was exerted in a relative velocity which was less than this, and is, in fact, the resistance competent to this relative and smaller velocity.

—Accordingly, Mr Smeaton, a most sagacious naturalist, places great confidence in the observations of a Mr Roufe of Leicestershire, who measured the resistance by the effect of the wind on a plane properly exposed to it. He does not tell us in what way the velocity of the wind was ascertained ; but our deference for his great penetration and experience disposes us to believe that the point was well determined. The resistance observed by Mr Roufe exceeds that resulting from Mr Robins's experiments nearly in the proportion of 7 to 10. —Accordingly, Mr Smeaton, a most sagacious naturalist, places great confidence in the observations of a Mr Roufe of Leicestershire, who measured the resistance by the effect of the wind on a plane properly exposed to it. He does not tell us in what way the velocity of the wind was ascertained ; but our deference for his great penetration and experience disposes us to believe that the point was well determined. The resistance observed by Mr Roufe exceeds that resulting from Mr Robins's experiments nearly in the proportion of 7 to 10. Chevalier de Borda made experiments similar to those of Mr Robins, and his results exceed those of Robins in the proportion of 5 to 6. These differences are so considerable, that we are at a loss what measure to abide by. It is much to be regretted, that in a subject so interesting both to the philosopher and the man of the world, experiments have not been multiplied. Nothing would tend so much to perfect the science of gunnery ; and indeed till this be done, all the labours of mathematicians are of no avail. Their investigations must remain an unintelligible cipher, till this key be supplied. It is to be hoped that Dr Charles Hutton of Woolwich, who has so ably extended Mr Robins's Examination of the Initial Velocities of Military Projectiles, will be encouraged to proceed to this part of the subject. We should wish to see, in the first place, a numerous set of experiments for ascertaining the resistance in moderate velocities : and, in order to avoid all error from the resistance and inertia of the machine, which is necessarily blended with the resistance of the ball, in Mr Robins's form of the experiment, and is separated with great uncertainty and risk of error, we would recommend a form of experiment somewhat different.

Let the axis and arm which carries the ball be connected with wheelwork, by which it can be put in motion, and gradually accelerated. Let the ball be so connected with a bent spring, that this shall gradually compress it as the resistance increases, and leave a mark of the degree of compression ; and let all this part of the apparatus be screened from the air except the ball. The velocity will be determined precisely by the revolutions of the arm, and the resistance by the compression of the spring. The best method would be to let this part of the apparatus be made to slide along the revolving arm, so that the ball can be made to describe larger and larger circles. An intelligent mechanic will easily contrive an apparatus of this kind, held at any distance from the axis by a cord, which passes over a pulley in the axis itself, and is then brought along a perforation in the axis, and comes out at its extremity, where it is fitted with a swivel, to prevent it from snapping by being twisted. Now let the machine be put in motion. The centrifugal force of the ball and apparatus will cause it to fly out as far as it is allowed by the cord ;

44
And of Mr
Roufe and
De Borda.

45

clusions.

46
A new form
of experi-
ment re-
commended.

and if the whole is put in motion by connecting it with some mill, the velocity may be most accurately ascertained. It may also be fitted with a bell and hammer like Gravefande's machine for measuring centrifugal forces. Now by gradually veering off more cord, the distance from the centre, and consequently the velocity and resistance increase, till the hammer is disengaged and strikes the bell.

Another great advantage of this form of the experiment is, that the resistance to very great velocities may be thus examined, which was impossible in Mr Robins's way. This is the great desideratum, that we may learn in what proportion of the velocities the resistances increase.

In the same manner, an apparatus, consisting of Dr Lynd's Anemometer, described in the article PNEUMATICS, n^o 311, &c. might be whirled round with prodigious rapidity, and the fluid on it might be made clammy, which would leave a mark at its greatest elevation, and thus discover the resistance of the air to rapid motions.

Nay, we are of opinion that the resistance to very rapid motions may be measured directly in the conduit pipe of some of the great cylinder bellows employed in blast furnaces; the velocity of the air in this pipe is ascertained by the capacity of the cylinder and the strokes of the piston. We think it our duty to point out to such as have the opportunities of trying them methods which promise accurate results for ascertaining this most desirable point.

47 The result of Robins's experiments as yet must be depended on. We are the more puzzled what measure to abide by, because Mr Robins himself, in his Practical Propositions, does not make use of the result of his own experiments, but takes a much lower measure. We must content ourselves, however, with this experimental measure, because it is as yet the only one of which any account can be given, or well-founded opinion formed.

48 Applied to the formulae. Therefore, in order to apply our formulae, we must reduce this experiment which was made on a ball of $4\frac{1}{2}$ inches diameter, moving with the velocity of $25\frac{1}{2}$ feet per second, to what would be the resistance to a ball of one inch, having the velocity 1 foot. This will evidently give us $R = \frac{0.04914}{4.5^2 \times 25.2^2}$, being diminished in

the duplicate ratio of the diameter and velocity. This gives us $R = 0.0000381973$ pounds, or $\frac{3.81973}{1000000}$ of a pound. The logarithm is 4.58204. The resistance here determined is the same whatever substance the ball be of; but the retardation occasioned by it will depend on the proportion of the resistance to the *vis inertia* of the ball; that is, to its quantity of motion. This in similar velocities and diameters is as the density of the ball. The balls used in military service are of cast iron or of lead, whose specific gravities are 7.207 and 11.37 nearly, water being 1. There is considerable variety in cast iron, and this density is about the medium. These data will give us.

	For Iron.	For Lead.
W, or weight of a ball 1 inch in diameter	lbs. 0.13648	0.21533
Log. of W	9.13509	9.33310
E" -	1116",6	1761",6
Log. of E	3.04790	3.24591
u, or terminal velocity	189,03	237,43
Log. u	2.27653	2.37553
a, or producing height	558,3	880,8

These numbers are of frequent use in all questions on this subject.

Mr Robins gives an expeditious rule for readily finding *a*, which he calls F (see the article GUNNERY), by which it is made 900 feet for a cast iron ball of an inch diameter. But no theory of resistance which he professes to use will make this height necessary for producing the terminal velocity. His F therefore is an *empirical* quantity, analogous indeed to the producing height, but accommodated to his theory of the trajectory of cannon-shot, which he promised to publish, but did not live to execute. We need not be very anxious about this; for all our quantities change in the same proportion with R, and need only a correction by a multiplier or divisor, when R shall be accurately established.

We may illustrate the use of these formula by an example or two.

1. Then, to find the resistance to a 24 pound ball moving with the velocity of 1670 feet in a second, of their which is nearly the velocity communicated by 16 lbs. of powder. The diameter is $5,603$ inches.

Log. R	-	-	+4.58204
Log. d^2	-	-	+1.49674
Log. 1670^2	-	-	+6.44548

Log. 334,4 lbs. = *r* - 2.52426

But it is found, by unequivocal experiments on the retardation of such a motion, that it is 504 lbs. This is owing to the causes often mentioned, the additional resistance to great velocities, arising from the condensation of the air, and from its pressure into the vacuum left by the ball.

2. Required the terminal velocity of this ball?

Log. R	-	-	+4.58204
Log. d^2	-	-	+1.49674

Log. resist. to veloc. 1	-	6.07878 = <i>a</i>
Log. W	-	1.38021 = <i>b</i>
Diff. of <i>a</i> and <i>b</i> , = log u^2	-	5.30143
Log. 447,4 = <i>u</i>	-	2.65071

As the terminal velocity *u*, and its producing height *a*, enter into all computations of military projectiles, we have inserted the following Table for the usual sizes of cannon-shot, computed both by the Newtonian theory of resistance, and by the resistances observed in Robins's experiments.

Lb. Ball.	Newton.		Robins.		Diam. Inch.
	Term. Vel.	2 <i>a</i> .	Term. Vel.	2 <i>a</i> .

Mr Muller, in his writings on this subject, gives a much

Table of terminal velocity according to Newton and Robins.

51
Mr Muller's theory altogether erroneous.

much smaller measure of resistance, and consequently a much greater terminal velocity: but his theory is a mistake from beginning to end (See his *Supplement* to his *Treatise of Artillery*, art. 150, &c.) In art. 148. he assumes an algebraic expression for a principle of mechanical argument; and from its consequence draws erroneous conclusions. He makes the resistance of a cylinder $\frac{1}{3}$ less than Newton *supposes* it; and his reason is false. Newton's measure is demonstrated by his commentators Le Seur and Jaquier to be even a little too small, upon his own principles, (Not. 277. Prop. 36. B. II.) Mr Muller then, without any seeming reason, introduces a new principle, which he makes the chief support of his theory, in opposition to the theories of other mathematicians. The principle is false, and even absurd, as we shall have occasion to show by and by. In consequence, however, of this principle, he is enabled to compare the results with many experiments, and the agreement is very flattering. But we shall soon see that little dependence can be had on such comparisons. We notice these things here, because Mr Muller being head of the artillery school in Britain, his publications have become a sort of text-books. We are miserably deficient in works on this subject, and must have recourse to the foreign writers.

52
The motions considered through their whole course.

We now proceed to consider these motions through their whole course: and we shall first consider them as affected by the resistance only; then we shall consider the perpendicular ascents and descents of heavy bodies through the air; and, lastly, their motion in a curvilinear trajectory, when projected obliquely. This must be done by the help of the abstruse parts of fluxionary mathematics. To make it more perspicuous, we shall, by way of introduction, consider the simply resisted rectilinear motions geometrically, in the manner of Sir Isaac Newton. As we advance, we shall quit this track, and prosecute it algebraically, having by this time acquired distinct ideas of the algebraic quantities.

33
Preliminary observations.

We must keep in mind the fundamental theorems of varied motions.

1. The momentary variation of the velocity is proportional to the force and the moment of time jointly, and may therefore be represented by $\pm \dot{v} = f \dot{t}$, where \dot{v} is the momentary increment or decrement of the velocity v , f the accelerating or retarding force, and \dot{t} the moment or increment of the time t .

2. The momentary variation of the square of the velocity is as the force, and as the increment or decrement of the space jointly; and may be represented by $\pm \dot{v}^2 = f \dot{s}$. The first proposition is familiarly known. The second is the 39th of Newton's *Principia*, B. I. It is demonstrated in the article *OPRICES*, p. 281. and is the most extensively useful proposition in mechanics.

53
The motions as affected by resistance only.

These things being premised, let the straight line AC (fig. 6.) represent the initial velocity V , and let CO, perpendicular to AC, be the time in which this velocity would be extinguished by the uniform action of the resistance. Draw through the point A an equilateral hyperbola AEB, having OF, OCD for its asymptotes; then let the time of the resisted motion be represented by the line CB, C being the first instant of the motion. If there be drawn perpendicular ordinates ac , gf , DB &c. to the hyperbola, they will be pro-

portional to the velocities of the body at the instants u , g , D , &c. and the hyperbolic areas AC ue A C $g f$, ACDB, &c. will be proportional to the spaces described during the times C u , C g , CB, &c.

For, suppose the time divided into an indefinite number of small and equal moments, C c , D d , &c. draw the ordinates ac , bd , and the perpendiculars $b\beta$, $a\alpha$. Then, by the nature of the hyperbola, AC : $ac = Oc$: OC; and AC : $ac = ac = Oc = OC$: OC, that is, A α : $ac = Cc$: OC, and A α : C $c = ac$: OC, = AC : ac : AC : OC; in like manner, B β : D $d = BD$: bd : BD : OD. Now D $d = Cc$, because the moments of time were taken equal, and the rectangles AC CO , BD DO , are equal, by the nature of the hyperbola; therefore A α : B $\beta = AC$: ac : BD : bd ; but as the points c , d continually approach, and ultimately coincide with C, D, the ultimate ratio of AC : ac to BD : bd is that of AC² to BD²; therefore the momentary decrements of AC and BD are as AC² and BD². Now, because the resistance is measured by the momentary diminution of velocity, these diminutions are as the squares of the velocities; therefore the ordinates of the hyperbola and the velocities diminish by the same law; and the initial velocity was represented by AC: therefore the velocities at all the other instants u , g , D are properly represented by the corresponding ordinates. Hence,

1. Since the abscissæ of the hyperbola are as the times, and the ordinates are as the velocities, the areas will be as the spaces described, and AC ue is to A $c g f$ as the space described in the time C u to the space described in the time C g (1st Theorem on varied motions).

2. The rectangle ACOF is to the area ACDB as the space formerly expressed by $2a$, or E to the space described in the resisting medium during the time CD: for AC being the velocity V , and OC the extinguishing time e , this rectangle is $= eV$, or E, or $2a$, of our former disquisitions; and because all the rectangles, such as ACOF, BDOG, &c. are equal, this corresponds with our former observation, that the space uniformly described with any velocity during the time in which it would be uniformly extinguished by the corresponding resistance is a constant quantity, viz. that in which we always had $e v = E$, or $2a$.

3. Draw the tangent A u , then, by the hyperbola C $u = CO$: now C u is the time in which the resistance to the velocity AC would extinguish it; for the tangent coinciding with the elemental arc A a of the curve, the first impulse of the uniform action of the resistance is the same with the first impulse of its varied action. By this the velocity AC is reduced to ac . If this operated uniformly like gravity, the velocities would diminish uniformly, and the space described would be represented by the triangle AC u .

This triangle, therefore, represents the height thro' which a heavy body must fall in vacuo, in order to acquire the terminal velocity.

4. The motion of a body resisted in the duplicate ratio of the velocity will continue without end, and a space will be described which is greater than any assignable space, and the velocity will grow less than any that can be assigned; for the hyperbola approaches continually to the asymptote, but never coincides with it. There is no velocity BD so small, but a smaller ZP will be found beyond it; and the hyperbolic space may

Plate
ccccxvii.

may be continued till it exceeds any surface that can be assigned.

5. The initial velocity AC is to the final velocity BD as the sum of the extinguishing time and the time of the retarded motion, is to the extinguishing time alone: for $AC : BD = OD$ (or $OC + CD$) : OC ; or $V : v = e : e + t$.

6. The extinguishing time is to the time of the retarded motion as the final velocity is to the velocity lost during the retarded motion: for the rectangles AFOC, BDOG are equal; and therefore AVGF and BVCD are equal and $VC : VA = VG : VB$; therefore $t = e \frac{V-v}{v}$, and $e = t \frac{v}{V-v}$.

7. Any velocity is reduced in the proportion of m to n in the time $e \frac{m-n}{n}$. For, let $AC : BD = m : n$; then $DO : CO = m : n$, and $DC : CO = m - n : n$, and $DC = \frac{m-n}{n} CO$, or $t = e \frac{m-n}{n}$. Therefore any velocity is reduced to one half in the time in which the initial resistance would have extinguished it by its uniform action.

55
Another mode of determining this motion.

Thus may the chief circumstances of this motion be determined by means of the hyperbola, the ordinates and abscissæ exhibiting the relations of the times and velocities, and the areas exhibiting the relations of both to the spaces described. But we may render the conception of these circumstances infinitely more easy and simple, by expressing them all by lines, instead of this combination of lines and surfaces. We shall accomplish this purpose by constructing another curve LKP, having the line ML δ , parallel to OD for its abscissa, and of such a nature, that if the ordinates to the hyperbola AC, $e x$, fg, BD, &c. be produced till they cut this curve in L, p, n, K, &c. and the abscissa in L, e , b, δ , &c. the ordinates $e p$, $b n$, δK , &c. may be proportional to the hyperbolic areas $e A c x$, $f a c O$, $\delta A c K$. Let us examine what kind of curve this will be.

Make $OC : O x = O x : O g$; then (Hamilton's *Coinc.* IV. 14. Cor.), the areas AC $x e$, $e x g f$ are equal: therefore drawing $p s$, $n t$ perpendicular to OM, we shall have (by the assumed nature of the curve L p K), $M s = s t$; and if the abscissa OD be divided into any number of small parts in geometrical progression (reckoning the commencement of them all from O), the axis Vi of this curve will be divided by its ordinates into the same number of equal parts; and this curve will have its ordinates LM, p s, n t, &c. in geometrical progression, and its abscissa in arithmetical progression.

Also, let KN, MV touch the curve in K and L, and let OC be supposed to be to O c, as OD to O d, and therefore C c to D d as OC to OD; and let these lines C c, D d be indefinitely small; then (by the nature of the curve) L o is equal to K r: for the areas a AC c, b BD d are in this case equal. Also l o is to k r, as LM to KI, because c C : d D = CO : DO:

Therefore $IN : IK = r K : r k$

$IK : ML = r k : o l$

$ML : MV = o l : o L$

and $IN : MN = r K : o L$.

That is, the subtangent IN, or MV, is of the same magnitude.

Vol. XV.

nitute, or is a constant quantity in every part of the curve.

Lastly, the subtangent IN, corresponding to the point K of the curve, is to the ordinate K δ as the rectangle BDOG or ACOF to the parabolic area BDCA.

For let fgbn be an ordinate very near to BD δ K; and let bn cut the curve in n, and the ordinate KI in q; then we have

$K q : q n = KI : IN$, or

$D g : q n = DO : IN$;

but $BD : AC = CO : DO$;

therefore $BD . D g : AC . q n = CO : IN$:

Therefore the sum of all the rectangles BD.Dg is to the sum of all the rectangles AC . qn, as CO to IN; but the sum of the rectangles BD . Dg is the space ACBD; and, because AC is given, the sum of the rectangles AC . qn is the rectangle of AC and the sum of all the lines qn; that is, the rectangle of AC and RL: therefore the space ACDB : AC . RL = CO : IN, and $ACDB \times IN = AC . CO . RL$; and therefore $IN : RL = AC . CO : ACDB$.

Hence it follows that QL expresses the area BVA, and, in general, that the part of the line parallel to OM, which lies between the tangent KN and the curve L p K, expresses the corresponding area of the hyperbola which lies without the rectangle BDOG.

And now, by the help of this curve, we have an easy way of conceiving and computing the motion of a body through the air. For the subtangent of our curve now represents twice the height through which the ball must fall in vacuo, in order to acquire the terminal velocity; and therefore serves for a scale on which to measure all the other representatives of the motion.

56
The whole reduced to a simple arithmetical computation.

But it remains to make another observation on the curve L p K, which will save us all the trouble of graphical operations, and reduce the whole to a very simple arithmetical computation. It is of such a nature, that when MI is considered as the abscissa, and is divided into a number of equal parts, and ordinates are drawn from the points of division, the ordinates are a series of lines in geometrical progression, or are continual proportionals. Whatever is the ratio between the first and second ordinate, there is the same between the second and third, between the third and fourth, and so on; therefore the number of parts into which the abscissa is divided is the number of these equal ratios which is contained in the ratio of the first ordinate to the last: For this reason, this curve has got the name of the *logistic* or *logarithmic* curve; and it is of immense use in the modern mathematics, giving us the solution of many problems in the most simple and expeditious manner, on which the genius of the ancient mathematicians had been exercised in vain. Few of our readers are ignorant, that the numbers called *logarithms* are of equal utility in arithmetical operations, enabling us not only to solve common arithmetical problems with astonishing dispatch, but also to solve others which are quite inaccessible in any other way. Logarithms are nothing more than the numerical measures of the abscissa of this curve, corresponding to ordinates, which are measured on the same or any other scale by the natural numbers; that is, if ML δ be divided into equal parts, and from the points of division lines be drawn parallel to

4 A

MI

MI, cutting the curve LpK , and from the points of intersection ordinates be drawn to MI, these will divide MI into portions, which are in the same proportion to the ordinates that the logarithms bear to their natural numbers.

In constructing this curve we were limited to no particular length of the line LR, which represented the space ACDB; and all that we had to take care of was, that when OC, Ox , Og were taken in geometrical progression, M_s , M_t should be in arithmetical progression. The abscissæ having ordinates equal to p , n , t , &c. might have been twice as long, as is shown in the dotted curve which is drawn through L. All the lines which serve to measure the hyperbolic spaces would then have been doubled. But NI would also have been doubled, and our proportions would have still held good; because this subtangent is the scale of measurement of our figure, as E or $2a$ is the scale of measurement for the motions.

Since then we have tables of logarithms calculated for every number, we may make use of them instead of this geometrical figure, which still requires considerable trouble to suit it to every case. There are two sets of logarithmic tables in common use. One is called a table of hyperbolic or natural logarithms. It is suited to such a curve as is drawn in the figure, where the subtangent is equal to that ordinate τv which corresponds to the side πO of the square $\pi\theta\lambda O$ inserted between the hyperbola and its asymptotes. This square is the unit of surface, by which the hyperbolic areas are expressed; its side is the unit of length, by which the lines belonging to the hyperbola are expressed; τv is $= 1$, or the unit of numbers to which the logarithms are suited, and then IN is also 1. Now the square $\theta\pi O\lambda$ being unity, the area BACD will be some number; πO being also unity, OD is some number: Call it x . Then, by the nature of the hyperbola, $OB : O\pi = \pi\theta : DB$: That is, $x : 1 = 1 : \frac{1}{x}$, so that DB is $\frac{1}{x}$.

Now calling $D d x$, the area $B D d b$, which is the fluxion (ultimately) of the hyperbolic area, is $\frac{1}{x}$. Now in the curve LpK , MI has the same ratio to NI that BACD has to $\theta\lambda O\pi$: Therefore, if there be a scale of which NI is the unit, the number on this scale corresponding to MI has the same ratio to 1 which the number measuring BACD has to 1; and Ii, which corresponds to $BD db$, is the fluxion (ultimately) of MI: Therefore, if MI be called the logarithm of x , $\frac{1}{x}$ is properly represented by the fluxion of MI. In short, the line MI is divided precisely as the line of numbers on a Gunter's scale, which is therefore a line of logarithms; and the numbers called logarithms are just the lengths of the different parts of this line measured on a scale of equal parts. Therefore, when

we meet with such an expression as $\frac{1}{x}$ viz. the fluxion of a quantity divided by the quantity itself, we consider it as the fluxion of the logarithm of that quantity, because it is really so when the quantity is a number; and it is therefore strictly true that the fluent of $\frac{1}{x}$ is the hyperbolic logarithm of x .

Certain reasons of convenience have given rise to another set of logarithms; these are suited to a logarithmic curve whose subtangent is only $\frac{4.1429}{1000000}$ of the ordinate τv , which is equal to the side of the hyperbolic square, and which is assumed for the unit of number. We shall suit our applications of the preceding investigation to both these, and shall first use the common logarithms whose subtangent is 0.43429.

The whole subject will be best illustrated by taking an example of the different questions which may be proposed. 57
Illustrated
by exam-
ples.

Recollect that the rectangle ACOF is $= 2a$, or $\frac{u^2}{g}$, or E ; for a ball of cast-iron one inch diameter, and if it has the diameter d , it is $\frac{u^2 d}{g}$, or $2ad$, or $E d$.

I. It may be required to determine what will be the space described in a given time t by a ball setting out with a given velocity V , and what will be its velocity v at the end of that time.

Here we have $NI : MI = ACOF : BDCA$; now NI is the subtangent of the logarithmic curve; MI is the difference between the logarithms of OD and OC; that is, the difference between the logarithms of $e+t$ and e ;

ACOF is $2ad$, or $\frac{u^2 d}{g}$, or $E d$.

Therefore by common logarithms $0.43429 : \log. e+t - \log. e = 2ad : S$, = space described,

or $0.43429 : \log. \frac{e+t}{e} = 2ad : S$,

and $S = \frac{2ad}{0.43429} \times \log. \frac{e+t}{e}$,

by hyperbolic logarithms $S = 2ad \times \log. \frac{e+t}{e}$.

Let the ball be a 12 pounder, and the initial velocity be 1600 feet, and the time 20 seconds. We must first find e , which is $\frac{2ad}{V}$.

Therefore, $\log. 2a$	-	-	+ 3.03236
$\log. d (4, 5)$	-	-	+ 0.65321
$\log. V. (1600)$	-	-	- 3.20412

Log. of $3'', 03 = e$	-	-	0.48145
And $e+t$ is $23'', 03$, of which the log. is	-	-	1.36229
from which take the log. of e	-	-	0.48145

remains the log. of $\frac{e+t}{e}$ 0.88084

This must be considered as a common number by which we are to multiply $\frac{2ad}{0.43429}$.

Therefore add the logarithms of $2ad$	-	-	+ 3.68557
$\log. \frac{e+t}{e}$	-	-	+ 9.94490
$\log. 0.43429$	-	-	- 9.63778

Log. S. 9833 feet	-	-	3.99269
-------------------	---	---	---------

For the final velocity,
OD : OC = AC : BD, or $e+t : e = V : v$.

$23'', 03 : 3'', 03 = 1600 : 210 \frac{1}{2} = v$.

The ball has therefore gone 3278 yards, and its velocity is reduced from 1600 to 210.

It may be agreeable to the reader to see the gradual progress of the ball during some seconds of its motion.

T.	S.	Diff.	V.	Diff.
1"	1383		1203	397
2"	2456	1073	964	239
3"	3336	880	804	160
4"	4080	744	690	114
5"	4725	645	604	86
6"	5294	569	537	67

The first column is the time of the motion, the second is the space described, the third is the differences of the spaces, showing the motion during each successive second; the fourth column is the velocity at the end of the time t ; and the last column is the differences of velocity, showing its diminution in each successive second. We see that at the distance of 1000 yards the velocity is reduced to one half, and at the distance of less than a mile it is reduced to one third.

II. It may be required to determine the distance at which the initial velocity V is reduced to any other quantity v . This question is solved in the very same manner, by substituting the logarithms of V and v for those of $e+t$ and e ; for $AC : BD = OD : OC$, and therefore $\log. \frac{AC}{BD} = \log. \frac{OD}{OC}$, or $\log. \frac{V}{v} = \log. \frac{e+t}{e}$.

Thus it is required to determine the distance in which the velocity 1780 of a 24 pound ball (which is the medium velocity of such a ball discharged with 16 pounds of powder) will be reduced to 1500.

Here d is 5,68, and therefore the logarithm of $2ad$ is - - - +3.78671
 $\log. \frac{V}{v} = 0,07433$, of which the log. is +8.87116
 $\log. 0,43429$ - - - -9.63778

$\log. 1047,3$ feet, or 349 yards 3.02009
 This reduction will be produced in about $\frac{7}{8}$ of a second.

III. Another question may be to determine the time which a ball, beginning to move with a certain velocity, employs in passing over a given space, and the diminution of velocity which it sustains from the resistance of the air.

We may proceed thus:

$2ad : S = 0,43429 : \log. \frac{e+t}{e} = t$. Then to $\log. \frac{e+t}{e}$ add $\log. e$ and we obtain $\log. e+t$, and $e+t$; from which if we take e we have t . Then to find v , say $e+t : e = V : v$.

We shall conclude these examples by applying this last rule to Mr Robin's experiment on a musket bullet of $\frac{3}{4}$ of an inch in diameter, which had its velocity reduced from 1670 to 1425 by passing through 100 feet of air. This we do in order to discover the resistance which it sustained, and compare it with the resistance to a velocity of 1 foot per second.

We must first ascertain the first term of our analogy. The ball was of lead, and therefore $2a$ must be multiplied by d and by m , which expresses the ratio of the density of lead to that of cast iron. d is 0,75, and m is

$\frac{11,37}{7,21} = 1,577$. Therefore $\log. 2a$ 3.03236

d 9.87506
 m 0.19782

$\log. 2adm$ 3.10524

and $2adm = 127,12$.

Now $1274,2 : 100 = 0,43429 : 0,03408 = \log. \frac{e+t}{e}$.

But $e = \frac{2adm}{V} = 0,763$, and its logarithm = 9.88252, which, added to 0.03408, gives 9.91660, which is the log. of $e+t$, = 0,825, from which take e , and there remains $t = 0,062$, or $\frac{62}{1000}$ of a second, for the time of passage. Now, to find the remaining velocity, say $825 : 1670 = 1544 : v$.

But in Mr Robins's experiment the remaining velocity was only 1425, the ball having lost 245; whereas by this computation it should have lost only 126. It appears, therefore, that the resistance is double of what it would have been if the resistance increased in the duplicate proportion of the velocity. Mr Robins says it is nearly triple. But he supposes the resistance to flow motions much smaller than his own experiment, so often mentioned, fully warrants.

The time e , in which the resistance of the air would extinguish the velocity is 0,763. Gravity, or the weight of the bullet, would have done it in $\frac{1670}{32}$ or 52";

therefore the resistance is $\frac{52}{0,763}$ times, or nearly 68 times its weight, by this theory, or 5,97 pounds. If we calculate from Mr Robins's experiment, we must say $\log. \frac{V}{v} : 0,43429 = 100 : eV$, which will be 630,23, and $e = \frac{630,23}{1670} = 0,3774$, and $\frac{52}{0,3774}$ gives 138 for the proportion of the resistance to the weight, and makes the resistance 12,07 pounds, fully double of the other.

It is to be observed, that with this velocity, which greatly exceeds that with which the air can rush into a void, there must be a statical pressure of the atmosphere equal to $6\frac{1}{2}$ pounds. This will make up the difference, and allows us to conclude that the resistance arising solely from the motion communicated to the air follows very nearly the duplicate proportion of the velocity.

The next experiment, with a velocity of 1690 feet, gives a resistance equal to 157 times the weight of the bullet, and this bears a much greater proportion to the former than 1690² does to 1670²; which shows, that although these experiments clearly demonstrate a prodigious augmentation of resistance, yet they are by no means susceptible of the precision which is necessary for discovering the law of this augmentation, or for a good foundation of practical rules; and it is still greatly to be wished that a more accurate mode of investigation could be discovered.

Thus we have explained, in great detail, the principles and the process of calculation for the simple case of

of the motion of projectiles through the air. The learned reader will think that we have been unreasonably prolix, and that the whole might have been compressed in less room, by taking the algebraic method. We acknowledge that it might have been done even in a few lines. But we have observed, and our observation has been confirmed by persons well versed in such subjects, that in all cases where the fluxionary process introduces the fluxion of a logarithm, there is a great want of distinct ideas to accompany the hand and eye. The solution comes out by a sort of magic or legerdemain, we cannot tell either *how* or *why*. We therefore thought it our duty to furnish the reader with distinct conceptions of the things and quantities treated of. For this reason, after showing, in Sir Isaac Newton's manner, how the spaces described in the retarded motion of a projectile followed the proportion of the hyperbolic areas, we shewed the nature of another curve, where lines could be found which increase in the very same manner as the path of the projectile increases; so that a point describing the abscissa MI of this curve moves precisely as the projectile does. Then, discovering that this line is the same with the line of logarithms on a Gunter's scale, we shewed how the logarithm of a number really represents the path or space described by the projectile. And we were the more disposed to do this, because in the articles LOGARITHMS and LOGARITHMIC CURVE, there has not been that notice taken of it which would have been proper.

Having thus, we hope, enabled the reader to conceive distinctly the quantities employed, we shall leave the geometrical method, and prosecute the rest of the subject in a more compendious manner.

60
Of the perpendicular ascents of heavy projectiles.

We are, in the next place, to consider the perpendicular ascents and descents of *heavy* projectiles, where the resistance of the air is combined with the action of gravity: and we shall begin with the descents.

Let u , as before, be the terminal velocity, and g the accelerating power of gravity: When the body moves with the velocity u , the resistance is equal to g ; and in every other velocity v , we must have $u^2 : v^2 = g :$

$\frac{g v^2}{u^2} = r$, for the resistance to that velocity. In the descent the body is urged by gravity g , and opposed by the resistance $\frac{g v^2}{u^2}$: therefore the remaining accelerating force, which we shall call f , is $g - \frac{g v^2}{u^2}$, or

$\frac{g u^2 - g v^2}{u^2}$, or $\frac{g (u^2 - v^2)}{u^2} = f$.

Now the fundamental theorem for varied motions is $f \dot{s} = u \dot{v}$, and $\dot{s} = \frac{v \dot{v}}{f} = \frac{u^2}{g} \times \frac{v \dot{v}}{u^2 - v^2}$, and $s =$

$\frac{u^2}{g} \times \int \frac{v \dot{v}}{u^2 - v^2} + C$. Now the fluent of $\frac{v \dot{v}}{u^2 - v^2}$ is $= -$ hyperb. log of $\sqrt{u^2 - v^2}$. For the fluxion of

$\sqrt{u^2 - v^2}$ is $-\frac{v \dot{v}}{\sqrt{u^2 - v^2}}$, and this divided by the

quantity $\sqrt{u^2 - v^2}$, of which it is the fluxion, gives precisely $\frac{v \dot{v}}{u^2 - v^2}$, which is therefore the fluxion of

its hyperbolic logarithm. Therefore $S = - \frac{u^2}{g} \times$

$L \sqrt{u^2 - v^2} + C$. Where L means the hyperbolic logarithm of the quantity annexed to it, and λ may be used to express its common logarithm. (See article FLUXIONS).

The constant quantity C for completing the fluent is determined from this consideration, that the space described is o , when the velocity is o : therefore $C =$

$\frac{u^2}{g} \times L \sqrt{u^2} = o$, and $C = \frac{u^2}{g} \times L \sqrt{u^2}$, and the

complete fluent $S = \frac{u^2}{g} \times L \sqrt{u^2} - L \sqrt{u^2 - v^2}$,

$= \frac{u^2}{g} \times L \sqrt{\frac{u^2}{u^2 - v^2}} = \frac{u^2}{0.43429g} \times \lambda \sqrt{\frac{u^2}{u^2 - v^2}}$,

or (putting M for 0.43429 , the modulus or subtangent of the common logarithmic curve) $= \frac{u^2}{Mg} \times \lambda \sqrt{\frac{u^2}{u^2 - v^2}}$.

This equation establishes the relation between the space fallen through, and the velocity acquired by the

fall. We obtain by it $\frac{gS}{u^2} = L \sqrt{\frac{u^2}{u^2 - v^2}}$, and

$\frac{2gS}{u^2} = L \cdot \frac{u^2}{u^2 - v^2}$, or, which is still more convenient for us, $\frac{M \times 2gS}{u^2} = \lambda \frac{u^2}{u^2 - v^2}$, that is, equal to

the logarithm of a certain number: therefore having found the natural number corresponding to the fraction

$\frac{M \times 2gS}{u^2}$, consider it as a logarithm, and take out the number corresponding to it: call this n . Then, since

n is equal to $\frac{u^2}{u^2 - v^2}$, we have $n u^2 - n v^2 = u^2$,

and $n u^2 - u^2 = n v^2$, or $n v^2 = u^2 \times \frac{n - 1}{n}$, and $v^2 =$

$\frac{u^2 \times n - 1}{n}$.

To expedite all the computations on this subject, it will be convenient to have multipliers ready computed for $M \times 2g$, and its half,

viz. 27,794, whose log. is - - - 1.44396
and 13,897 - - - 1.14293

But v may be found much more expeditiously by observing that $\sqrt{\frac{u^2}{u^2 - v^2}}$ is the secant of an arch

of a circle whose radius is u , and whose sine is v , or whose radius is unity and sine $= \frac{v}{u}$: therefore, considering the above fraction as a logarithmic secant, look for it in the tables, and then take the sine of the arc of which this is the secant, and multiply it by u ; the product is the velocity required.

We shall take an example of a ball whose terminal velocity is 689 $\frac{1}{2}$ feet, and ascertain its velocity after a fall of 1848 feet. Here,

$u^2 = 475200$ and its log. - - - 5.67688
 $u = 689\frac{1}{2}$ - - - 2.83844

$g = 32$ - - - 1.50515
 $S = 1848$ - - - 3.26670

Then

Then log. 27,794 - - - + 1.44396
log. 3 - - - + 3.26670
log. u^2 - - - - 5.67688

Log. of 0,10809 = log. n - - - 9.03378
0,10809 is the logarithm of 1,2826 = n , and $n-1$ =
0,2826, and $\frac{u^2 \times n-1}{n} = 323,6$, = v^2 , and v =
323,6.

In like manner, 0,054045 (which is half of 0,10809)
will be found to be the logarithmic secant of 28° , whose
fine 0,46947 multiplied by 689 $\frac{1}{2}$ gives 324 for the velo-
city.

The process of this solution suggests a very perspi-
cuous manner of conceiving the law of descent; and it
may be thus expressed:

M is to the logarithm of the secant of an arch whose
fine is $\frac{v}{u}$, and radius 1, as $2a$ is to the height through
which the body must fall in order to acquire the velo-
city v . Thus, to take the same example.

1. Let the height h be sought which will produce the
velocity 323,62, the terminal velocity of the ball being
689,34. Here $2a$, or $\frac{u^2}{g}$ is 14850, and $\frac{323,62}{689,34} =$
0,46947, which is the fine of 28° . The logarithmic
secant of this arch is 0,05407. Now M or 0,43429 :
0,05407 = 14850 : 1848, the height wanted.

2. Required the velocity acquired by the body by
falling 1848 feet. Say 14850 : 1848 = 0,43429 :
0,05407. Look for this number among the logarith-
mic secants. It will be found at 28° , of which the lo-
garithmic fine is - - - - 9.67161

Add to this the log. of u - - - 2.83844

The sum - - - - 2.51005

is the logarithm of 323,62, the velocity required.

We may observe, from these solutions, that the ac-
quired velocity continually approaches to, but never
equals, the terminal velocity. For it is always express-
ed by the fine of an arch of which the terminal velo-
city is the radius. We cannot help taking notice here
of a very strange assertion of Mr Muller, late professor
of mathematics and director of the royal academy at
Woolwich. He maintains, in his Treatise on Gunnery,
his Treatise on Fluxions, and in many of his numerous
works, that a body cannot possibly move through the
air with a greater velocity than this; and he makes this
a fundamental principle, on which he establishes a theo-
ry of motion in a resisting medium, which he asserts
with great confidence to be the only just theory; say-
ing, that all the investigations of Bernoulli, Euler, Ro-
bins, Simpson, and others, are erroneous. We use this
strong expression, because, in his criticisms on the
works of those celebrated mathematicians, he lays aside
good manners, and taxes them not only with igno-
rance, but with dishonesty; saying, for instance, that it
required no small dexterity in Robins to confirm by his
experiments a theory founded on false principles; and
that Thomas Simpson, in attempting to conceal his
obligations to him for some valuable propositions, by
changing their form, had ignorantly fallen into gross
errors.

Nothing can be more palpably absurd than this asser-

tion of Mr Muller. A blown bladder will have but a
small terminal velocity; and when moving with this ve-
locity, or one very near it, there can be no doubt that
it will be made to move much twifter by a smart stroke.
Were the assertion true, it would be impossible for a
portion of air to be put into motion through the rest,
for its terminal velocity is nothing. Yet this author
makes this assertion a principle of argument, saying,
that it is impossible that a ball can issue from the mouth
of a cannon with a greater velocity than this; and that
Robins and others are grossly mistaken, when they give
them velocities three or four times greater, and resist-
ances which are 10 or 20 times greater than is possible;
and by thus compensating his small velocities by still
smaller resistances, he confirms his theory by many
experiments adduced in support of the others. No rea-
son whatever can be given for the assertion. Newton,
or perhaps Huygens, was the first who observed that
there was a limit to the velocity which gravity could
communicate to a body; and this limit was found by
his commentators to be a term to which it was vastly
convenient to refer all its other motions. It therefore
became an object of attention; and Mr Muller, through
inadvertency, or want of discernment, has fallen into
this mistake, and with that arrogance and self-conceit
which mark all his writings, has made this mistake a
fundamental principle, because it led him to establish a
novel set of doctrines on this subject. He was fretted
at the superior knowledge and talents of Mr Simpson,
his inferior in the academy, and was guilty of several
mean attempts to hurt his reputation. But they were
unsuccessful.

We might proceed to consider the motion of a body
projected downwards. While the velocity of projection
is less than the terminal velocity, the motion is deter-
mined by what we have already said: for we must com-
pute the height necessary for acquiring this velocity in
the air, and suppose the motion to have begun there.
But if the velocity of projection be greater, this method
fails. We pass it over (though not in the least more
difficult than what has gone before), because it is of
mere curiosity, and never occurs in any interesting case.
We may just observe, that since the motion is twifter
than the terminal velocity, the resistance must be great-
er than the weight, and the motion will be retarded.
The very same process will give us for the space described

$$S = \frac{u^2}{g} \times L \sqrt{\frac{V^2 - u^2}{v^2 - u^2}},$$
 V being the velocity of
projection, greater than u . Now as this space evident-
ly increases continually (because the body always falls),
but does not become infinite in any finite time, the frac-
tion $\frac{V^2 - u^2}{v^2 - u^2}$ does not become infinite; that is, v^2
does not become equal to u^2 : therefore although the
velocity V is continually diminished, it never becomes
so small as u . Therefore u is a limit of diminution as
well as of augmentation.

We must now ascertain the relation between the time
of the descent and the space described, or the velocity
acquired. For this purpose we may use the other fun-
damental proposition of varied motions $f \dot{=} v$, which, in
the present case, becomes $\frac{g u^2 - v^2}{n^2} \dot{=} v$; therefore t

61
Erroneous
assertion of
Mr Mull-
ler.

u^2

$$\frac{u^2}{g} \times \frac{\dot{v}}{u^2 - v^2} = \frac{u}{g} \times \frac{\dot{u}v}{u^2 - v^2}, \text{ and } t = \frac{u}{g} \times \int \frac{u\dot{v}}{u^2 - v^2}.$$

Now (art. FLUXIONS) $\int \frac{u\dot{v}}{u^2 - v^2} = L \sqrt{\frac{u+v}{u-v}}$. There-

fore $t = \frac{u}{g} \times L \sqrt{\frac{u+v}{u-v}} = \frac{u}{Mg} \times \lambda \sqrt{\frac{u+v}{u-v}}$. This fluent needs no constant quantity to complete it, or rather $C=0$; for t must be $=0$ when $v=0$. This will evidently be the case: for then $L \sqrt{\frac{u+v}{u-v}}$ is $L \sqrt{\frac{u}{u}} = L 1, = 0$.

But how does this quantity $\frac{u}{Mg} \times \lambda \sqrt{\frac{u+v}{u-v}}$ signify a time? Observe, that in whatever numbers, or by whatever units of space and time, u and g are expressed, $\frac{u}{g}$ expresses the number of units of time in which the velocity u is communicated or extinguished by gravity; and $L \sqrt{\frac{u+v}{u-v}}$, or $\lambda \sqrt{\frac{u+v}{u-v}}$, is always an abstract number, multiplying this time.

We may illustrate this rule by the same example. In what time will the body acquire the velocity 323,62? Here $u+v=1012,96$, $u-v=365,72$; therefore $\lambda \sqrt{\frac{u+v}{u-v}} = 0,22122$, and $\frac{u}{g}$ (in feet and seconds) is $21'', 542$. Now, for greater perspicuity, convert the equation $t = \frac{u}{Mg} \times \lambda \sqrt{\frac{u+v}{u-v}}$ into a proportion: thus

$$M : \lambda \sqrt{\frac{u+v}{u-v}} = \frac{u}{g} : t, \text{ and we have } 0,43429 : 0,22122 = 21'', 542 : 10'', 973, \text{ the time required.}$$

This is by far the most distinct way of conceiving the subject; and we should always keep in mind that the numbers of symbols which we call logarithms are really parts of the line MI in the figure of the logistic curve, and that the motion of a point in this line is precisely similar to that of the body. The Marquis Poleni, in a dissertation published at Padua in 1725, has with great ingenuity constructed logarithmics suited to all the cases which can occur. Herman, in his *Phoronomia*, has borrowed much of Poleni's methods, but has obscured them by an affectation of language geometrically precise, but involving the very obscure notion of abstract ratios.

It is easy to see that $\sqrt{\frac{u+v}{u-v}}$ is the cotangent of the $\frac{1}{2}$ complete of an arch, whose radius is 1, and whose sine is $\frac{v}{u}$. For let KC (fig 6.) be $=u$, and BE $=v$; then KD $=u+v$, and DA $=u-v$. Join KB and BA, and draw CG parallel to KB. Now GA is the tangent of $\frac{1}{2}$ BA, $=\frac{1}{2}$ complement of HB. Then, by similarity of triangles, GA : AC = AB : BK, $=\sqrt{AD} : \sqrt{DK} = \sqrt{u-v} : \sqrt{u+v}$ and $\frac{AC}{GA} (= \cotan. \frac{1}{2} BA) = \sqrt{\frac{u+v}{u-v}}$; therefore look for $\frac{v}{u}$ among the natural sines, or for $\log. \frac{u}{v}$ among the logarithmic sines,

and take the logarithmic cotangent of the half complement of the corresponding arch. This, considered as a common number, will be the second term of our proportion. This is a shorter process than the former.

By reversing this proportion we get the velocity corresponding to a given time.

To compare this descent of 1848 feet in the air with the fall of the body *in vacuo* during the same time, say $21'', 542^2 : 10'', 973^2 = 1848 : 1926,6$, which makes a difference of 79 feet.

Cor. 1. The time in which the body acquires the velocity u by falling through the air, is to the time of acquiring the same velocity by falling *in vacuo*, as u .

$L \sqrt{\frac{u+v}{u-v}}$ to v : for it would acquire this velocity *in vacuo* during the time $\frac{v}{g}$, and it acquires it in the air in the time $\frac{u}{g} L \sqrt{\frac{u+v}{u-v}}$.

2. The velocity which the body acquires by falling through the air in the time $\frac{u}{g} L \sqrt{\frac{u+v}{u-v}}$, is to the velocity which it would acquire *in vacuo* during the same time, as v to $u L \sqrt{\frac{u+v}{u-v}}$. For the velocity which it would acquire *in vacuo* during the time $\frac{u}{g} L \sqrt{\frac{u+v}{u-v}}$ must be $u L \sqrt{\frac{u+v}{u-v}}$ (because in any time $\frac{w}{g}$ the velocity w is acquired).

In the next place, let a body, whose terminal velocity is u , be projected perpendicularly upwards, with any velocity V . It is required to determine the height to which it ascends, so as to have any remaining velocity v , and the time of its ascent; as also the height and time in which its whole motion will be extinguished.

We have now $\frac{g(u^2+v^2)}{u^2}$ for the expression of f ;

for both gravity and resistance act now in the same direction and retard the motion of the ascending body:

$$\text{therefore } \frac{g(u^2+v^2)}{u^2} \dot{s} = -v\dot{v}, \text{ and } \dot{s} = -\frac{u^2}{g} \times \frac{v\dot{v}}{u^2+v^2},$$

$$\text{and } s = -\frac{u^2}{g} \times \int \frac{v\dot{v}}{u^2+v^2} + C = -\frac{u^2}{g} \times L \sqrt{\frac{u^2+v^2}{u^2+V^2}} + C$$

(see art. FLUXIONS). This must be $=0$ at the beginning of the motion, that is, when $v=V$, that is,

$$-\frac{u^2}{g} \times L \sqrt{\frac{u^2+V^2}{u^2+V^2}} + C = 0, \text{ or } C = \frac{u^2}{g} \times L \sqrt{\frac{u^2+V^2}{u^2+V^2}}, \text{ and}$$

the complete fluent will be $s = \frac{u^2}{g} \times (L \sqrt{\frac{u^2+V^2}{u^2+v^2}} -$

$$L \sqrt{\frac{u^2+V^2}{u^2+V^2}}) = \frac{u^2}{g} \times L \sqrt{\frac{u^2+V^2}{u^2+v^2}} = \frac{u^2}{Mg} \times \lambda \sqrt{\frac{u^2+V^2}{u^2+v^2}}$$

Let b be the greatest height to which the body will rise. Then $s = b$ when $v = 0$; and $b = \frac{u^2}{g} \times$

$$L \sqrt{\frac{u^2+V^2}{u^2}} = \frac{u^2}{Mg} \times \lambda \sqrt{\frac{u^2+V^2}{u^2}}. \text{ We have}$$

$$\lambda \sqrt{\frac{u^2+V^2}{u^2+v^2}} = \frac{mg}{u^2}; \text{ therefore } \lambda \left(\frac{u^2+V^2}{u^2+v^2} \right) = \frac{2Mgs}{u^2}$$

Therefore

Therefore let n be the number whose common logarithm is $\frac{2Mg}{u^2}$; we shall have $n = \frac{u^2 + V^2}{u^2 + v^2}$, and $v^2 = \frac{u^2 + V^2}{n} - u^2$; and thus we obtain the relation of s and v , as in the case of descents: but we obtain it still easier by observing that $\sqrt{u^2 + V^2}$ is the secant of an arch whose radius is u , and whose tangent is V , and that $\sqrt{u^2 + v^2}$ is the secant of another arch of the same circle, whose tangent is v .

Let the same ball be projected upwards with the velocity 411.05 feet per second. Required the whole height to which it will rise?

Here $\frac{V}{u}$ will be found the tangent of $30.48\frac{1}{2}$, the logarithmic secant of which is 0.06606. This, multiplied by $\frac{u^2}{Mg}$, gives 2259 feet for the height. It would have risen 2640 feet in a void.

66
Velocity of projection compared with that with which it reaches the ground.

Suppose this body to fall down again. We can compare the velocity of projection with the velocity with which it again reaches the ground. The ascent and descent are equal: therefore $\sqrt{\frac{u^2 + V^2}{u^2}}$, which

multiplies the constant factor in the ascent, is equal to

$\sqrt{\frac{u^2}{u^2 - v^2}}$, the multiplier in the descent. The first is

the secant of an arch whose tangent is V ; the other is the secant of an arch whose sine is v . These secants are equal, or the arches are the same; therefore the velocity of projection is to the final returning velocity as the tangent to the sine, or as the radius to the cosine of the arch. Thus suppose the body projected with the

terminal velocity, or $V = u$; then $v = \frac{u}{\sqrt{2}}$. If $V = 689$, $v = 487$.

We must in the last place ascertain the relation of the space and the time.

Here $\frac{g(u^2 + v^2)}{u^2} \dot{t} = -\dot{v}$, and $\dot{t} = -\frac{u^2}{g} \times \frac{\dot{v}}{u^2 + v^2} =$

$-\frac{u}{g} \times \frac{uv}{u^2 + v^2}$; and $t = -\frac{u}{g} \times \int \frac{uv}{u^2 + v^2} + C$. Now

(art. FLUXIONS) $\int \frac{uv}{u^2 + v^2}$ is an arch whose tangent

$= \frac{v}{u}$ and radius 1; therefore $t = -\frac{u}{g} \times \text{arc. tan. } \frac{v}{u} + C$.

This must be $= 0$ when $v = V$, or $C = \frac{u}{g} \times \text{arc. tan. } \frac{V}{u}$.

$\frac{V}{u} = 0$, and $C = \frac{u}{g} \times \text{arc. tan. } \frac{V}{u}$, and the complete flu-

ent is $t = \frac{u}{g} \times \left(\text{arc. tan. } \frac{V}{u} - \text{arc. tan. } \frac{v}{u} \right)$ The quan-

tities within the brackets express a portion of the arch of a circle whose radius is unity; and are therefore ab-

stract numbers, multiplying $\frac{u}{g}$, which we have shown to

be the number of units of time in which a heavy body falls *in vacuo* from the height a , or in which it acquires the velocity u .

We learn from this expression of the time, that how-

ever great the velocity of projection, and the height to which this body will rise, may be, the time of its ascent is limited. It never can exceed the time of falling from the height a *in vacuo* in a greater proportion than that of a quadrantal arch to the radius, nearly the proportion of 8 to 5. A 24 pound iron ball cannot continue rising above 14 seconds, even if the resistance to quick motions did not increase faster than the square of the velocity. It probably will attain its greatest height in less than 12 seconds, let its velocity be ever so great.

In the preceding example of the whole ascent, $v = 0$, and the time $t = \frac{u}{g} \times \text{arc. tan. } \frac{V}{u}$, or $\frac{u}{g} \text{ arc. } 30^\circ.48'$.

Now $30^\circ.48' = 1848'$, and the radius 1 contains 3438; therefore the arch $= \frac{1848}{3438} = 0.5376$; and $\frac{u}{g} = 21.54$.

Therefore $t = 21.54 \times 0.5376 = 11.58$, or nearly 11.5 seconds. The body would have risen to the same height in a void in $10\frac{3}{4}$ seconds.

Cor. 1. The time in which a body, projected in the air with any velocity V , will attain its greatest height, is to that in which it would attain its greatest height *in vacuo*, as the arch whose tangent expresses the velocity is to the tangent; for the time of the ascent in the air is $\frac{u}{g} \times \text{arch}$; the time of the ascent *in vacuo* is $\frac{V}{g}$. Now $\frac{V}{u} = \tan.$ and $V = u \times \tan.$ and $\frac{V}{g} = \frac{u}{g} \times \tan.$

It is evident, by inspecting fig. 6. that the arch AI is to the tangent AG as the sector ICA to the triangle GCA; therefore the time of attaining the greatest height in the air is to that of attaining the greatest height *in vacuo* (the velocities of projection being the same), as the circular sector to the corresponding triangle.

If therefore a body be projected upwards with the terminal velocity, the time of its ascent will be to the time of acquiring this velocity *in vacuo* as the area of a circle to the area of the circumscribed square.

2. The height H to which a body will rise in a void, is to the height b to which it would rise through the air when projected with the same velocity V as $M \cdot V^2$ to $u^2 \times \lambda \frac{u^2 + V^2}{u^2}$: for the height to which it will rise *in*

vacuo is $\frac{V^2}{2g}$, and the height to which it rises in the air is

$\frac{u^2}{Mg} \times \lambda \sqrt{\frac{u^2 + V^2}{u^2}}$; therefore $H : b = \frac{V^2}{2g} :$

$\frac{u^2}{Mg} \times \lambda \sqrt{\frac{u^2 + V^2}{u^2}} = V^2 : \frac{u^2}{M} \times 2 \lambda \sqrt{\frac{u^2 + V^2}{u^2}} = V^2 :$

$\frac{u^2}{M} \times \lambda \frac{u^2 + V^2}{u^2} = M \cdot V^2 : u^2 \times \lambda \frac{u^2 + V^2}{u^2}.$

Therefore if the body be projected with its terminal velocity, so that $V = u$, the height to which it will rise

in the air is $\frac{30103}{43429}$ of the height to which it will rise

in vacuo, or $\frac{5}{7}$ in round numbers.

We have been thus particular in treating of the perpendicular ascents and descents of heavy bodies through the air, in order that the reader may conceive distinctly the

lem not
solved by
Newton.

the quantities which he is thus combining in his algebraic operations, and may see their connection in nature with each other. We shall also find that, in the present state of our mathematical knowledge, this simple state of the case contains almost all that we can determine with any confidence. On this account it were to be wished that the professional gentlemen would make many experiments on these motions. There is no way that promises so much for assisting us in forming accurate notions of the air's resistance. Mr Robins's method with the pendulum is impracticable with great shot; and the experiments which have been generally resorted to for this purpose, viz. the ranges of shot and shells on a horizontal plane, are so complicated in themselves, that the utmost mathematical skill is necessary for making any inferences from them; and they are subject to such irregularities, that they may be brought to support almost any theory whatever on this subject. But the perpendicular flights are affected by nothing but the initial velocity and the resistance of the air; and a considerable deviation from their intended direction does not cause any sensible error in the consequences which we may draw from them for our purpose.

But we must now proceed to the general problem, to determine the motion of a body projected in any direction, and with any velocity. Our readers will believe beforehand that this must be a difficult subject, when they see the simplest cases of rectilinear motion abundantly abstruse: it is indeed so difficult, that Sir Isaac Newton has not given a solution of it, and has thought himself well employed in making several approximations, in which the fertility of his genius appears in great lustre. In the tenth and subsequent propositions of the second book of the *Principia*, he shows what state of density in the air will comport with the motion of a body in any curve whatever: and then, by applying this discovery to several curves which have some similarity to the path of a projectile, he finds one which is not very different from what we may suppose to obtain in our atmosphere. But even this approximation was involved in such intricate calculations, that it seemed impossible to make any use of it. In the second edition of the *Principia*, published in 1713, Newton corrects some mistakes which he had committed in the first, and carries his approximations much farther, but still does not attempt a direct investigation of the path which a body will describe in our atmosphere. This is somewhat surprising. In prop. 14. &c. he shows how a body, actuated by a centripetal force, in a medium of a density varying according to certain laws, will describe an eccentric spiral, of which he assigns the properties, and the law of description. Had he supposed the density constant, and the difference between the greatest and least distances from the centre of centripetal force exceedingly small in comparison with the distances themselves, his spiral would have coincided with the path of a projectile in the air of uniform density, and the steps of his investigation would have led him immediately to the complete solution of the problem. For this is the real state of the case. A heavy body is not acted on by equal and parallel gravity, but by a gravity inversely proportional to the square of the distance from the centre of the earth, and in lines tending to that centre nearly; and it was with the view of simplifying the

investigation, that mathematicians have adopted the other hypothesis.

Soon after the publication of this second edition of the *Principia*, the dispute about the invention of the fluxionary calculus became very violent, and the great promoters of that calculus upon the continent were in the habit of proposing difficult problems to exercise the talents of the mathematician. Challenges of this kind frequently passed between the British and foreigners. Dr Keill of Oxford had keenly espoused the claim of Sir Isaac Newton to this invention, and had engaged in a very acrimonious altercation with the celebrated John Bernoulli of Basle. Bernoulli had published in the *Acta Eruditorum Lipsæ* an investigation of the law of forces, by which a body moving in a resisting medium might describe any proposed curve, reducing the whole to the simplest geometry. This is perhaps the most elegant specimen which he has given of his great talents. Dr Keill proposed to him the particular problem of the trajectory and motion of a body moving through the air, as one of the most difficult. Bernoulli very soon solved the problem in a way much more general than it had been proposed, viz. without any limitation either of the law of resistance, the law of the centripetal force, or the law of density, provided only that they were regular, and capable of being expressed algebraically. Dr Brooke Taylor, the celebrated author of the *Method of Increments*, solved it at the same time, in the limited form in which it was proposed. Other authors since that time have given other solutions. But they are all (as indeed they must be) the same in substance with Bernoulli's. Indeed they are all (Bernoulli's not excepted) the same with Newton's first approximations, modified by the steps introduced into the investigation of the spiral motions mentioned above; and we still think it most strange that Sir Isaac did not perceive that the variation of curvature, which he introduced into that investigation, made the whole difference between his approximations and the complete solution. This we shall point out as we go along. And we now proceed to the problem itself, of which we shall give Bernoulli's solution, restricted to the case of uniform density and a resistance proportional to the square of the velocity. This solution is more simple and perspicuous than any that has since appeared.

PROBLEM. To determine the trajectory, and all the circumstances of the motion, of a body projected thro' the air from A (fig. 7.) in the direction AB, and resisted in the duplicate ratio of the velocity.

Let the arch AM be put $= z$, the time of describing it, the abscissa AP $= x$, the ordinate PM $= y$. Let the velocity in the point M $= v$, and let MN, $= z$, be described in the moment t ; let r be the resistance of the air, g the force of gravity, measured by the velocity which it will generate in a second; and let a be the height through which a heavy body must fall in *vacuo* to acquire the velocity which would render the resistance of the air equal to its gravity: so that we have $r = \frac{v^2}{2a}$; because, for any velocity u , and producing

height h , we have $g = \frac{u^2}{2h}$

Let Mm touch the curve in M; draw the ordinate pNm

Action of
gravity in
a given
time.

p Nm , and draw Mo , Nn perpendicular to Np and Mm . Then we have $MN=z$, and $Mo=x$, also mo is ultimately $=y$ and Mm is ultimately $=MN$ or z . Lastly, let us suppose x to be a constant quantity, the elementary ordinates being supposed equidistant.

The action of gravity during the time t may be measured by mN , which is half the space which it would cause the body to describe uniformly in the time t with the velocity which it generates in that time. Let this be resolved into nN , by which it deflects the body into a curvilinear path, and mn , by which it retards the ascent and accelerates the descent of the body along the tangent. The resistance of the air acts solely in retarding the motion, both in ascending and descending, and has no deflective tendency. The whole action of gravity then is to its accelerating or retarding tendency as mN to mn , or (by similarity of triangles) as mM to mo . Or $z:y=g:\frac{g y}{z}$, and the whole retardation in

the ascent will be $r + \frac{g y}{z}$. The same fluxionary symbol will express the retardation during the descent, because in the descent the ordinates decrease, and y is a negative quantity.

The diminution of velocity is $-\dot{v}$. This is proportional to the retarding force and to the time of its action jointly, and therefore $-\dot{v} = r + \frac{g y}{z} \times t$; but the time t is as the space z divided by the velocity v ; therefore $-\dot{v} = r + \frac{g y}{z} \times \frac{z}{v} = -\frac{r z + g y}{v}$, and $-v \dot{v} = -$

$r z - g y = \frac{v^2 z}{2a} - g y$. Because mN is the deflection by gravity, it is as the force g and the square of the time t jointly (the momentary action being held as uniform). We have therefore mN , or $-\dot{y} = g t^2$. Observe that mN is in fact only the half of $-\dot{y}$; but g being twice the fall of a heavy body in a second, we have $-\dot{y}$ strictly equal to $g t^2$. But $t^2 = \frac{z^2}{v^2}$; therefore $-\dot{y} = \frac{g z^2}{v^2}$,

and $v^2 = \frac{g z^2}{-\dot{y}}$, and $-v^2 \dot{y} = g z^2$. The fluxion of this equation is $-v^2 \ddot{y} - 2v \dot{y} \dot{v} = 2g z \dot{z}$; but, because $z:y = mM:mo = mN:mn = y:z$, we have $\dot{z} z = y \dot{y}$. Therefore $2g y \dot{y} = 2g z \dot{z} = -v^2 \ddot{y} - 2v \dot{y} \dot{v}$, and $-2v \dot{y} \dot{v} = v^2 \ddot{y} - 2g y \dot{y}$, and $-v \dot{v} = \frac{v^2 \ddot{y}}{2y} - g \dot{y}$. But we have already $-v \dot{v} =$

$\frac{r z + g y}{v}$; therefore $\frac{v^2 \ddot{y}}{2y} = \frac{r z + g y}{v} + g \dot{y}$, and finally $\frac{\ddot{y}}{y} =$

VOL. XV.

$\frac{\ddot{z}}{z}$, or $a \ddot{y} = \dot{z} \ddot{y}$, for the fluxionary equation of the curve.

If we put this into the form of a proportion, we have $a : \dot{z} = \ddot{y} : \dot{y}$. Now this evidently establishes a relation between the length of the curve and its variation of curvature; and between the curve itself and its evolution, which are the very circumstances introduced by Newton into his investigation of the spiral motions. And

the equation $\frac{\ddot{z}}{z} = \frac{\ddot{y}}{y}$ is evidently an equation connected with the logarithmic curve and the logarithmic spiral. But we must endeavour to reduce it to a lower order of fluxions, before we can establish a relation between z , x , and y .

Let p express the ratio of \dot{y} to \dot{x} , that is, let p be $= \frac{\dot{y}}{\dot{x}}$, or $p \dot{x} = \dot{y}$. It is evident that this expresses the inclination of the tangent at M to the horizon, and that p is the tangent of this inclination, radius being unity. Or it may be considered merely as a number, multiplying \dot{x} , so as to make it $= \dot{y}$. We now have $\dot{y}^2 = p^2 \dot{x}^2$, and since $\dot{z}^2 = \dot{x}^2 + \dot{y}^2$, we have $\dot{z}^2 = \dot{x}^2 + p^2 \dot{x}^2 = 1 + p^2 \times \dot{x}^2$ and $\dot{z} = \dot{x} \sqrt{1 + p^2}$.

Moreover, because we have supposed the abscissa x to increase uniformly, and therefore \dot{x} to be constant, we have $\ddot{y} = \dot{x} \dot{p}$, and $\ddot{z} = \dot{x} \dot{p}$. Now let q express the ratio of \dot{p} to \dot{x} , that is, make $\frac{\dot{p}}{\dot{x}} = q$, or $q \dot{x} = \dot{p}$.

This gives us $\dot{x} \dot{q} = \dot{p}$, and $\dot{x}^2 \dot{q} = \dot{x} \dot{p} = \ddot{y}$.

By these substitutions our former equation $a \ddot{y} = \dot{z} \ddot{y}$ changes to $a \dot{x}^2 \dot{q} = \dot{x} \sqrt{1 + p^2} \dot{x} \dot{p}$, or $a \dot{q} = \dot{p} \sqrt{1 + p^2}$, and, taking the fluent on both sides, we have $a q = \int \dot{p} \sqrt{1 + p^2} + C$, C being the constant quantity required for completing the fluent according to the limiting conditions of the case. Now $\dot{x} = \frac{\dot{p}}{q}$, and $\frac{1}{q} =$

$\int \frac{a \dot{p}}{\dot{p} \sqrt{1 + p^2}} + C$. Therefore $x = \int \frac{a \dot{p}}{\dot{p} \sqrt{1 + p^2}} + C$

Also, since $\dot{y} = p \dot{x} = \frac{p \dot{p}}{q}$, we have $\dot{y} =$

$\frac{a p \dot{p}}{\int \dot{p} \sqrt{1 + p^2} + C}$
Also $\dot{z} = \dot{x} \sqrt{1 + p^2} = \frac{a \dot{p} \sqrt{1 + p^2}}{\int \dot{p} \sqrt{1 + p^2} + C}$

The values of \dot{x} , \dot{y} , \dot{z} , give us

$x = \int \frac{a \dot{p}}{\dot{p} \sqrt{1 + p^2}} + C = a \int \frac{\dot{p}}{\dot{p} \sqrt{1 + p^2}} + C$
4 B

$$y = \frac{f \dot{p} \sqrt{1+p^2}}{f \dot{p} \sqrt{1+p^2} + C} = a \frac{f \dot{p} \sqrt{1+p^2}}{f \dot{p} \sqrt{1+p^2} + C}$$

$$z = \frac{f \dot{p} \sqrt{1+p^2}}{f \dot{p} \sqrt{1+p^2} + C} = a \frac{f \dot{p} \sqrt{1+p^2}}{f \dot{p} \sqrt{1+p^2} + C}$$

The process therefore of describing the trajectory is, 1st. To find q in terms of p by the area of the curve whose abscissa is p and the ordinate is $\sqrt{1+p^2}$.

2^d, We get x by the area of another curve whose abscissa is p , and the ordinate is $\frac{1}{q}$.

3^d, We get y by the area of a third curve whose abscissa is p , and the ordinate is $\frac{p}{q}$.

The problem of the trajectory is therefore completely solved, because we have determined the ordinate, abscissa, and arch of the curve for any given position of its tangent. It now only remains to compute the magnitudes of these ordinates and abscissæ, or to draw them by a geometrical construction. But in this consists the difficulty. The areas of these curves, which express the lengths of x and y , can neither be computed nor exhibited geometrically, by any accurate method yet discovered, and we must content ourselves with approximations. These render the description of the trajectory exceedingly difficult and tedious, so that little advantage has as yet been derived from the knowledge we have got of its properties. It will however greatly assist our conception of the subject to proceed some length in this construction; for it must be acknowledged that very few distinct notions accompany a mere algebraic operation, especially if in any degree complicated, which we confess is the case in the present question.

76
To compute the magnitude of the ordinate and abscissa.

Plate
ccccxviii.

Let $BmNR$ (fig. 8.) be an equilateral hyperbola, of which B is the vertex, BA the semitransverse axis, which we shall assume for the unity of length. Let AV be the semiconjugate axis $= BA$, $=$ unity, and AS the asymptote, bisecting the right angle BAV . Let PN , p be two ordinates to the conjugate axis, exceedingly near to each other. Join BP , AN , and draw $B\beta$, $N\gamma$ perpendicular to the asymptote, and BC parallel to AP . It is well known that BP is equal to NP . Therefore $PN^2 = BA^2 + AP^2$. Now since $BA = 1$, if we make $AP = p$ of our formulæ, PN is $\sqrt{1+p^2}$, and Pp is \dot{p} , and the area $BAPNB = \int \dot{p} \sqrt{1+p^2}$: That is to say, the number $\int \dot{p} \sqrt{1+p^2}$ (for it is a number) has

the same proportion to unity of number that the area $BAPNB$ has to $BCVA$, the unit of surface. This area consists of two parts, the triangle APN , and the hyperbolic sector ABN . $APN = \frac{1}{2} AP \times PN = \frac{1}{2} p \sqrt{1+p^2}$, and the hyperbolic sector $ABN = BN \vee \beta$, which is equivalent to the hyperbolic logarithm of the number represented by $A\gamma$ when $A\beta$ is unity. Therefore it is equal to $\frac{1}{2}$ the logarithm of $p + \sqrt{1+p^2}$. Hence we see by the bye that $\int \dot{p} \sqrt{1+p^2} = \frac{1}{2} p \sqrt{1+p^2} + \frac{1}{2}$ hyperbolic logarithm $p + \sqrt{1+p^2}$.

Now let AMD be another curve, such that its ordinates Vm , PD , &c. may be proportional to the areas $ABmV$, $ABNP$, and may have the same proportion to AB , the unity of length, which these areas have to $ABCV$, the unity of surface. Then $VM : VC =$

$Vm : BA : VCBA$ and $PD : P\delta = PNBA : VCBA$, &c. These ordinates will now represent $\int \dot{p} \sqrt{1+p^2}$ with reference to a linear unit, as the areas to the hyperbola represented it in reference to a superficial unit.

Again, in every ordinate make $PD : P\delta = P\delta : PO$, and thus we obtain a reciprocal to PD or to $\int \dot{p} \sqrt{1+p^2}$, or equivalent to $\int \frac{1}{\dot{p} \sqrt{1+p^2}}$. This

will evidently be $\frac{x}{ap}$, and PO op will be $\frac{x}{a}$, and the area contained between the lines AF , AW , and the curve $GEOH$, and cut off by the ordinate PO , will represent $\frac{x}{a}$.

Lastly, make $PO : PQ = AV : AP = 1 : p$; and then PQ qp will represent $\frac{y}{a}$, and the area $ALEQP$ will represent $\frac{y}{a}$.

But we must here observe, that the fluents expressed by these different areas require what is called the *correction* to accommodate them to the circumstances of the case. It is not indifferent from what ordinate we begin to reckon the areas. This depends on the initial direction of the projectile, and that point of the abscissa AP must be taken for the commencement of all the areas which gives a value of p suited to the initial direction. Thus, if the projection has been made from A (fig. 7.) at an elevation of 45° , the ratio of the fluxions x and y is that of equality; and therefore the point E of fig. 8. where the two curves intersect and have a common ordinate, evidently corresponds to this condition. The ordinate EV passes through V , so that AV or $p = AB = 1$, $=$ tangent 45° , as the case requires. The values of x and of y corresponding to any other point of the trajectory, such as that which has AP for the tangent of the angle which it makes with the horizon, are now to be had by computing the areas $VEOP$, $VEQP$.

Another curve might have been added, of which the ordinates would exhibit the fluxions of the arch of the trajectory $z = \frac{ap \sqrt{1+p^2}}{\int \dot{p} \sqrt{1+p^2} + C}$ and of which the area would exhibit the arch itself. And this would have been very easy, for it is $z = a \frac{\dot{p} \sqrt{1+p^2}}{\int \dot{p} \sqrt{1+p^2} + C}$, which is evidently the fluxion of the hyperbolic logarithm of $\int \dot{p} \sqrt{1+p^2}$. But it is needless, since $z = x \sqrt{1+p^2}$, and we have already got x . It is only increasing PO in the ratio of BA to BP .

And thus we have brought the investigation of this problem a considerable length, having ascertained the *form* of the trajectory. This is surely done when the ratio of the arch, abscissæ, and ordinate, and the position of its tangent, is determined in every point. But it is still very far from a solution, and much remains to be done before we can make any practical application of it. The only

general consequence that we can deduce from the premises

77
Consequences of knowing the form of the trajectory.

PROJECTILES. *Fig. 3* Plate CCCXVII

Plate CCCXVII

78
To determine the velocity in different points.

ses is, that in every case where the resistance in any point bears the same proportion to the force of gravity, the trajectory will be similar. Therefore two balls, of the same density, projected in the same direction, will describe similar trajectories if the velocities are in the subduplicate ratio of the diameters. This we shall find to be of considerable practical importance. But let us now proceed to determine the velocity in the different points of the trajectory, and the times of describing its several portions.

Recollect, therefore, that $v^2 = \frac{-gz^2}{y}$ and that $\dot{z}^2 = \dot{x}^2 + \dot{p}^2$ and $\dot{y} = \dot{x} \dot{p}$. This gives $v^2 = \frac{-g\dot{x}\dot{p}}{\dot{p}}$

$$\text{But } \dot{p} = q\dot{x}. \text{ Therefore } v^2 = \frac{-g \times \dot{x} + \dot{p}^2}{q}, = \frac{-ag \dot{x} + \dot{p}^2}{q}, \text{ and } v = \sqrt{\frac{-g \dot{x} + \dot{p}^2}{q}}, = \frac{\sqrt{a \sqrt{-g \dot{x} + \dot{p}^2}}}{\sqrt{f \dot{p} \sqrt{1 + p^2} + C}}.$$

Also i was found $= \frac{z}{v} = \frac{\dot{x} \sqrt{1 + p^2}}{v} = \frac{\dot{p} \sqrt{1 + p^2}}{qv}$. If we now substitute for v its value

$$\text{just found, we obtain } i = \frac{\dot{p}}{\sqrt{-gq}}, \text{ and } t = \int \frac{\dot{p}}{\sqrt{-gq}}, = \frac{\int \dot{p} \sqrt{a}}{\sqrt{-g} \int \dot{p} \sqrt{1 + p^2} + C}, = \frac{\sqrt{a}}{\sqrt{-g}} \times \int \frac{\dot{p}}{\sqrt{f \dot{p} \sqrt{1 + p^2} + C}}.$$

79
Difficulty of accommodating the formulae to particular cases.

The greatest difficulty still remains, viz. the accommodating these formulæ, which appear abundantly simple, to the particular cases. It would appear at first sight that all trajectories are similar; since the ratio of the fluxions of the ordinate and abscissa corresponding to any particular angle of inclination to the horizon seems the same in them all: but a due attention to what has been hitherto said on the subject will show us that we have as yet only been able to ascertain the velocity in the point of the trajectory, which has a certain inclination to the horizon, indicated by the quantity p , and the time (reckoned from some assigned beginning) when the projectile is in that point.

To obtain absolute measures of these quantities, the term of commencement must be fixed upon. This will be expressed by the constant quantity C , which is assumed for completing the fluent of $\dot{p} \sqrt{1 + p^2}$, which is the basis of the whole construction. We there found $q = \frac{\int \dot{p} \sqrt{1 + p^2}}{a}$. This fluent is in general $q = \frac{C + \int \dot{p} \sqrt{1 + p^2}}{a}$, and the constant quantity C is to

80
Euler's method the simplest.

be accommodated to some circumstances of the case. Different authors have selected different circumstances, Euler, in his Commentary on Robins, and in a dissertation in the Memoirs of the Academy of Berlin published in 1753, takes the vertex of the curve for the beginning

of his abscissa and ordinate. This is the simplest method of any, for C must then be so chosen that the whole fluent may vanish when $p = 0$, which is the case in the vertex of the curve, where the tangent is parallel to the horizon. We shall adopt this method.

Therefore, let AP (fig. 9.) $= x$, $PM = y$. $AM = z$. Put the quantity C which is introduced into the fluent

Plate CC CXVII.

equal to $\frac{z}{a}$. It is plain that n must be a number; for it must be homologous with $\dot{p} \sqrt{1 + p^2}$, which is a number. For brevity's sake let us express the fluent of $\dot{p} \sqrt{1 + p^2}$ by the single letter P ; and thus we shall have $x = a \times \int \frac{\dot{p}}{n + P}$, $y = a \times \int \frac{p \dot{p}}{n + P}$, $z = a \times \int \frac{\dot{p} \sqrt{1 + p^2}}{n + P}$. And $v^2 = \frac{-ag(1 + p^2)}{n + P}$. Now the height h necessary for communicating any velocity v is $\frac{v^2}{2g} = \frac{-ag(1 + p^2)}{2g(n + P)} = \frac{-\frac{1}{2}a(1 + p^2)}{n + P}$. And lastly, $t = \frac{\sqrt{a}}{\sqrt{g}} \int \frac{\dot{p}}{\sqrt{n + P}}$.

These fluents, being all taken so as to vanish at the vertex, where the computation commences, and where p is $= 0$ (the tangent being parallel to the horizon), we obtain in this case $h = \frac{\frac{1}{2}a}{n} = \frac{a}{2n}$, and $n = \frac{a}{2h}$.

Hence we see that the circumstance which modifies all the curves, distinguishing them from each other, is the velocity (or rather its square) in the highest point of the curve. For h being determined for any body whose terminal velocity is u , n is also determined; and this is the modifying circumstance. Considering it geometrically, it is the area which must be cut off from the area $DMAP$ of fig. 8. in order to determine the ordinates of the other curves.

We must farther remark, that the values now given relate only to that part of the area where the body is descending from the vertex. This is evident; for in order that y may increase as we recede from the vertex, its fluxion must be taken in the opposite sense to what it was in our investigation. There we supposed y to increase as the body ascended, and then to diminish during the descent; and therefore the fluxion of y was first positive and then negative.

The same equations, however, will serve for the ascending branch CNA of the curve, only changing the sign of P ; for if we consider y as decreasing during the ascent, we must consider q as expressing $\frac{-\dot{p}}{x}$

therefore P , or $\int \dot{p} \sqrt{1 + p^2}$, which is $= \frac{q}{a}$, must be taken negatively. Therefore, in the ascending branch, we have AQ or x (increasing as we recede from A) $= a \times \int \frac{\dot{p}}{n - P}$, QN or $y = a \times \int \frac{p \dot{p}}{n - P}$, AN or $z = a \times \int \frac{\dot{p} \sqrt{1 + p^2}}{n - P}$, $t = \frac{\sqrt{a}}{\sqrt{g}} \times \int \frac{\dot{p}}{\sqrt{n - P}}$, and the height producing the velocity at $N = \frac{\frac{1}{2}a(1 + p^2)}{n - P}$.

Hence we learn by the bye, that in no part of the ascending branch can the inclination of the tangent be such

81
Remarkable property of the curve or trajectory.

such that P shall be greater than n ; and that if we suppose P equal to n in any point of the curve, the velocity in that point will be infinite. That is to say, there is a certain assignable elevation of the tangent which cannot be exceeded in a curve which has this velocity in the vertex. The best way for forming a conception of this circumstance in the nature of the curve, is to invert the motion, and suppose an accelerating force equal and opposite to the resistance, to act on the body in conjunction with gravity. It must describe the same curve, and this branch ANC must have an asymptote LO, which has this limiting position of the tangent. For, as the body descends in this curve, its velocity increases to infinity by the joint action of gravity and this accelerating force, and yet the tangent never approaches so near the perpendicular position as to make $P = n$. This remarkable property of the curve was known to Newton, as appears by his approximations, which all lead him to curves of a hyperbolic form, having one asymptote inclined to the horizon. Indeed it is pretty obvious: For the resistance increasing faster than the velocity, there is no velocity of projection so great but that the curve will come to deviate so from the tangent, that in a finite time it will become parallel to the horizon. Were the resistance proportional to the velocity, then an infinite velocity would produce a rectilinear motion, or rather a deflection from it less than any that can be assigned.

82
On what
its form
and mag-
nitude de-
pends.

We now see that the particular form and magnitude of this trajectory depends on two circumstances, a and n . a affects chiefly the magnitude. Another circumstance might indeed be taken in, viz. the diminution of the accelerating force of gravity by the static effect of the air's gravity. But, as we have already observed, this is too trifling to be attended to in military projectiles.

$\frac{y}{x}$ was made equal to \dot{p} . Therefore the radius of curvature, determined by the ordinary methods, is $\frac{\dot{x}(1+p^2)(\sqrt{1+p^2})}{\dot{p}}$ *, and, because \dot{x} is $\frac{a}{n+P}$ for the descending branch of the curve, the radius of curvature at M is $\frac{a \times \sqrt{1+p^2} \times \sqrt{1+p^2}}{n+P}$, and, in the ascending branch at N, it is $\frac{a \times \sqrt{1+p^2} \times \sqrt{1+p^2}}{n-P}$.

On both sides therefore, when the velocity is infinitely great, and P by this means supposed to equal or exceed n , the radius of curvature is also infinitely great. We also see that the two branches are unlike each other, and that when p is the same in both, that is, when the tangent is equally inclined to the horizon, the radius of curvature, the ordinate, the absciss, and the arch, are all greater in the ascending branch. This is pretty obvious. For as the resistance acts entirely in diminishing the velocity, and does not affect the deflection occasioned by gravity, it must allow gravity to incurvate the path so much the more (with the same inclination of its line of action) as the velocity is more diminished. The curvature, therefore, in those points which have the same inclination of the tangent, is greatest in the descending branch, and the motion is swiftest in the ascending branch. It is otherwise in a void, where both

sides are alike. Here n becomes infinite, or there is no terminal velocity; and n also becomes infinite, being

$$= \frac{a}{2b}.$$

It is therefore in the quantity P , or $\int \dot{p} \sqrt{1+p^2}$, that the difference between the trajectory in a void and in a resisting medium consists; it is this quantity which expresses the accumulated change of the ratio of the increments of the ordinate and absciss. In vacuo the second increment of the ordinate is constant when the first increment of the abscissa is so, and the whole increment of the ordinate is as $1+p$. And this difference is so much the greater as P is greater in respect of n . P is nothing at the vertex, and increases along with the angle MTP; and when this is a right angle, P is infinite. The trajectory in a resisting medium will come therefore to deviate infinitely from a parabola, and may even deviate farther from it than the parabola deviates from a straight line. That is, the distance of the body in a given moment from that point of its parabolic path where it would have been in a void, is greater than the distance between that point of the parabola from the point of the straight line where it would have been, independent of the action of gravity. This must happen whenever the resistance is greater than the weight of the body, which is generally the case in the beginning of the trajectory in military projectiles; and this (were it now necessary) is enough to show the inutility of the parabolic theory.

Although we have no method of describing this trajectory, which would be received by the ancient geometers, we may ascertain several properties of it, which will assist us in the solution of the problem. In particular, we can assign the absolute length of any part of it by means of the logistic curve. For because $P = \int \dot{p} \sqrt{1+p^2}$, we have $\dot{p} \sqrt{1+p^2} = \dot{P}$, and there-

83

fore z , which was $= a \times \frac{\int \dot{p} \sqrt{1+p^2}}{\int \dot{p} \sqrt{1+p^2}} + C$, or $= a \times \frac{\dot{P}}{n+P}$, may be expressed by logarithms; or $z = a \times \text{hyp. log. of } \frac{n+P}{n}$, since at the vertex A, where z must be $= 0$, P is also $= 0$.

Being able, in this way, to ascertain the length AM of the curve (counted from the vertex), corresponding to any inclination p of the tangent at its extremity M, we can ascertain the length of any portion of it, such as Mm, by first finding the length of the part Am, and then of the part AM. This we do more expeditiously thus: Let p express the position of the tangent in M, and

q its position at m ; then $AM = a \times \text{log. } \frac{n+P}{n}$ and $Am = a \times \text{log. } \frac{n+Q}{n}$, and therefore $Mm = a \times \text{log. } \frac{n+Q}{n+P}$. Thus we can find the values of a great number of small portions, and the inclination of the tangents at their extremities. Then to each of these portions we can assign its proportion of the abscissa and ordinate, without having recourse to the values of x and y . For the portion of absciss corresponding to the arch Mm, whose

* Simpson's
Fluxions,
§ 63, &c.

Several
properties
of it ascer-
tained.

whose middle point is inclined to the horizon in the angle b , will be $M m \times \cosine b$, and the corresponding portion of the ordinate will be $M m \times \sin. b$. Then we obtain the velocity in each part of the curve by the equation $b = \frac{1}{2} a \times \frac{1 + p^2}{n + p}$; or, more directly the velocity

v at M will be $= \sqrt{ag} \frac{\sqrt{1 + p^2}}{\sqrt{n + P}}$. Lastly, divide the

length of the little arch by this, and the quotient will be the time of describing $M m$ very nearly. Add all these together, and we obtain the whole time of describing the arch AM , but a little too great, because the motion in the small arch is not perfectly uniform. The error, however, may be as small as we please, because we may make the arch as small as we please; and for greater accuracy, it will be proper to take the p by which we compute the velocity, a medium between the p for the beginning and that for the end of the arch.

84
Euler's method preferred.

This is the method followed by Euler, who was one of the most expert analysts, if not the very first, in Europe. It is not the most elegant, and the methods of some other authors, who approximate directly to the areas of the curves which determine the values of x and y , have a more scientific appearance; but they are not ultimately very different: For, in some methods, these areas are taken piecemeal, as Euler takes the arch; and by the methods of others, who give the value of the areas by Newton's method of describing a curve of the parabolic kind through any number of given points, the ordinates of these curves, which express x and y , must be taken singly, which amounts to the same thing, with the great disadvantage of a much more complicated calculus, as any one may see by comparing the expressions of x and y with the expression of z . As to those methods which approximate directly to the areas or values of x and y by an infinite series, they all, without exception, involve us in most complicated expressions, with coefficients of sines and tangents, and ambiguous signs, and engage us in a calculation almost endless. And we know of no series which converges fast enough to give us tolerable accuracy, without such a number of terms as is sufficient to deter any person from the attempt. The calculation of the arches is very moderate, so that a person tolerably versant in arithmetical operations may compute an arch with its velocity and time in about five minutes. We have therefore no hesitation in preferring this method of Euler's to all that we have seen, and therefore proceed to determine some other circumstances which render its application more general.

85
Its application made more general.

If there were no resistance, the smallest velocity would be at the vertex of the curve, and it would immediately increase by the action of gravity conspiring (in however small degree) with the motion of the body. But in a resisting medium, the velocity at the vertex is diminished by a quantity to which the acceleration of gravity in that point bears no assignable proportion. It is therefore diminished, upon the whole, and the point of smallest velocity is a little way beyond the vertex. For the same reasons, the greatest curvature is a little way beyond the vertex. It is not very material for our present purpose to ascertain the exact positions of those points.

The velocity in the descending branch augments continually: but it cannot exceed a certain limit, if the velocity at the vertex has been less than the terminal velocity; for when the curve is infinite, p is also infinite, and $b = \frac{1}{2} \frac{ap^2}{P}$, because n in this case is nothing in respect of

P , which is infinite; and because p is infinite, the number hyp. log. $p + \sqrt{1 + p^2}$, though infinite, vanishes in comparison with $p \times \sqrt{1 + p^2}$; so that in this case $P = \frac{1}{2} p^2$, and $b = a$, and $v =$ the terminal velocity.

If, on the other hand, the velocity at the vertex has been greater than the terminal velocity, it will diminish continually, and when the curve has become infinite, v will be equal to the terminal velocity.

In either case we see that the curve on this side will have a perpendicular asymptote. It would require a long and pretty intricate analysis to determine the place of this asymptote, and it is not material for our present purpose. The place and position of the other asymptote LO is of the greatest moment. It evidently distinguishes the kind of trajectory from any other. Its position depends on this circumstance, that if p marks the position of the tangent, $n = P$, which is the denominator of the fractions expressing the square of the velocity, must be equal to nothing, because the velocity is infinite: therefore, in this place, $P = n$, or $n = \frac{1}{2} p \sqrt{1 + p^2} + \frac{1}{2} \log. p + \sqrt{1 + p^2}$. In order, therefore, to find the point L , where the asymptote LO cuts the horizontal line AL , put $P = n$; then will $AL = x - \frac{y^2}{2} = a \times \left(\int \frac{p}{n - P} - \frac{1}{p} \int \frac{pp}{n - P} \right)$.

Through the whole of this article \int means fluent.

It is evident that the logarithms used in these expressions are the natural or hyperbolic. But the operations may be performed by the common tables by making the value of the arch $M m$ of the curve $= \frac{a}{M} \times \log.$

$\frac{n + Q}{n + P}$ &c. where M means the subtangent of the common logarithms, or 0.43429; also the time of describing this arch will be expeditiously had by taking a medium μ between the values of $\frac{\sqrt{1 + p^2}}{\sqrt{n + P}}$ and $\frac{\sqrt{1 + q^2}}{\sqrt{n + Q}}$,

and making the time $= \frac{\sqrt{a}}{M \mu \sqrt{g}} \times \log. \frac{n + Q}{n + P}$.

Such then is the process by which the form and magnitude of the trajectory, and the motion in it, may be determined. But it does not yet appear how this is to be applied to any question in practical artillery. In this process we have only learned how to compute the motion from the vertex in the descending branch till the ball has acquired a particular direction, and the motion to the vertex from a point of the ascending branch where the ball has another direction, and all this depending on the greatest velocity which the body can acquire by falling, and the velocity which it has in the vertex of the curve. But the usual question is, "What will be the motion of the ball projected in a certain direction with a certain velocity?"

86
Mode of applying this process in practice.

The mode of application is this: Suppose a trajectory computed for a particular terminal velocity, produced by the fall a , and for a particular velocity at the vertex, which

PROJECTILES.

which will be characterized by n , and that the velocity at that point of the ascending branch where the inclination of the tangent is 30° is 900 feet per second. Then, we are certain that if a ball, whose terminal velocity is that produced by the fall a , be projected with the velocity of 900 feet per second, and an elevation of 30° , it will describe this very trajectory, and the velocity and time corresponding to every point will be such as is here determined.

Now this trajectory will, in respect to form, answer an infinity of cases: for its characteristic is the proportion of the velocity in the vertex to the terminal velocity. When this proportion is the same, the number n will be the same. If therefore we compute the trajectories for a sufficient variety of these proportions, we shall find a trajectory that will nearly correspond to any case that can be proposed; and an approximation sufficiently exact will be had by taking a proportional medium between the two trajectories which come nearest to the case proposed.

87
Computed
tables or
trajectories.

Accordingly, a set of tables or trajectories have been computed by the English translator of Euler's Commentary on Robins's Gunnery. They are in number 18, distinguished by the position of the asymptote of the ascending branch. This is given for 5° , 10° , 15° , &c. to 85° , and the whole trajectory is computed as far as it can ever be supposed to extend in practice. The following table gives the value of the number n corresponding to each position of the asymptote.

OLB	n	OLB	n
0	0,00000	45	1,14779
5	0,08760	50	1,43236
10	0,17724	55	1,82207
15	0,27712	60	2,39033
20	0,37185	65	3,29040
25	0,48269	70	4,88425
30	0,60799	75	8,22357
35	0,75382	80	17,54793
40	0,92914	85	67,12291

Since the path of a projectile is much less incurvated, and more rapid in the ascending than in the descending branch, and the difference is so much the more remarkable in great velocities; it must follow, that the range on a horizontal or inclined plane depends most on the ascending branch: therefore the greatest range will not be made with that elevation which bisects the angle of position, but with a lower elevation; and the deviation from the bisecting elevation will be greater as the initial velocities are greater. It is very difficult to frame an exact rule for determining the elevation which gives the greatest range. We have subjoined a little table which gives the proper elevations (nearly) corresponding to the different initial velocities.

It was computed by the following approximation, which will be found the same with the series used by Newton in his Approximations.

Let e be the angle of elevation, a the height producing the terminal velocity, b the height producing the initial velocity, and c the number whose hyperbolic logarithm is 1 (*i. e.* the number 2,718). Then,

$$y = x \times \left(\tan. e + \frac{a}{2b \cdot \cos. e} \right) - \frac{a^2}{2b} \left(C_{\frac{x}{a \cdot \cos. e}} - 1 \right),$$

&c. Make $y = v$, and take the maximum by varying e , we obtain $\text{Sin.}^2 e + \frac{a \cdot \sin. e}{2b} = \text{hyperbol. log.}$

$$\left(1 + \frac{2b}{a \cdot \sin. e} \right), \text{ which gives us the angle } e.$$

The numbers in the first column, multiplied by the terminal velocity of the projectile, give us the initial velocity; and the numbers in the last column, being multiplied by the height producing the terminal velocity, and by 2,3026, give us the greatest ranges. The middle column contains the elevation. The table is not computed with scrupulous exactness, the question not requiring it. It may however be depended on within one part of 2000.

To make use of this table, divide the initial velocity by the terminal velocity u , and look for the quotient in the first column. Opposite to this will be found the elevation giving the greatest range; and the number in the last column being multiplied by 2,3026 $\times a$ (the height producing the terminal velocity) will give the range.

TABLE of Elevations giving the greatest Range.

Initial vel. u	Elevation.	Range. 2,3026 a
0,6909	43°.40'	0,1751
0,7820	43 .20	0,2169
0,8645	42 .50	0,2548

2,7635	35 .—	1,0319
3,1281	34 .40	1,1411
3,4544	34 .20	1,2298
3,4581	34 .20	1,2277
3,9101	33 .50	1,3371
4,1452	33 .30	1,3901
4,3227	33 .30	1,4274
4,6921	31 .50	1,5050
4,8361	31 .50	1,5341

Such is the solution which the present state of our mathematical knowledge enables us to give of this celebrated problem. It is exact in its principle, and the application of it is by no means difficult, or even operose. But let us see what advantage we are likely to derive from it.

In the first place, it is very limited in its application. There are few circumstances of general coincidence; and almost every case requires an appropriated calculus. Perhaps the only general rules are the two following:

1. Balls of equal density, projected with the same elevation, and with velocities which are as the square-roots of their diameters, will describe similar curves.— This is evident, because, in this case, the resistance will be in the ratio of their quantities of motion. Therefore

all

all the homologous lines of the motion will be in the proportion of the diameters.

2. If the initial velocities of balls projected with the same elevation are in the inverse subduplicate ratio of the whole resistances, the ranges, and all the homologous lines of their track, will be inversely as those resistances.

These theorems are of considerable use : for by means of a proper series of experiments on one ball projected with different elevations and velocities, tables may be constructed which will ascertain the motions of an infinity of others.

But when we take a retrospective view of what we have done, and consider the conditions which were assumed in the solution of the problem, we shall find that much yet remains before it can be rendered of great practical use, or even satisfy the curiosity of the man of science. The resistance is all along supposed to be in the duplicate ratio of the velocity ; but even theory points out many causes of deviation from this law, such as the pressure and condensation of the air, in the case of very swift motions ; and Mr Robins's experiments are sufficient to show us that the deviations must be exceedingly great in such cases. Mr Euler and all subsequent writers have allowed that it may be three times greater, even in cases which frequently occur ; and Euler gives a rule for ascertaining with tolerable accuracy what this increase and the whole resistance may amount to. Let H be the height of a column of air whose weight is equivalent to the resistance taken in the duplicate ratio of the velocity. The whole resistance will be expressed by $H + \frac{H}{28845}$. This number 28845 is the

height in feet of a column of air whose weight balances its elasticity. We shall not at present call in question his reasons for assigning this precise addition. They are rather reasons of arithmetical conveniency than of physical import. It is enough to observe, that if this measure of the resistance is introduced into the process of investigation, it is totally changed ; and it is not too much to say, that with this complication it requires the knowledge and address of a Euler to make even a partial and very limited approximation to a solution.— Any law of the resistance, therefore, which is more complicated than what Bernoulli has assumed, namely, that of a simple power of the velocity, is abandoned by all the mathematicians, as exceeding their abilities ; and they have attempted to avoid the error arising from the assumption of the duplicate ratio of the velocity, either by supposing the resistance throughout the whole trajectory to be greater than what it is in general, or they have divided the trajectory into different portions, and assigned different resistances to each, which vary, through the whole of that portion, in the duplicate ratio of the velocities. By this kind of patchwork they make up a trajectory and motion which corresponds, in some tolerable degree, with what ? With an accurate theory ? No ; but with a series of experiments. For, in the first place, every theoretical computation that we make, proceeds on a supposed initial velocity ; and this cannot be ascertained with any thing approaching to precision, by any theory of the action of gunpowder that we are yet possessed of. In the next place, our theories of the resisting power of the air are en-

tirely established on the experiments on the flights of shot and shells, and are corrected and amended till they tally with the most approved experiments we can find.

We do not learn the ranges of a gun by theory, but the theory by the range of the gun. Now the variety and irregularity of all the experiments which are appealed to are so great, and the acknowledged difference between the resistance to slow and swift motions is also so great, that there is hardly any supposition which can be made concerning the resistance, that will not agree in its results with many of those experiments. It appears from the experiments of Dr Hutton of Woolwich, in 1784, 1785, and 1786, that the shots frequently deviated to the right or left of their intended track 200, 300, and sometimes 400 yards. This deviation was quite accidental and anomalous, and there can be no doubt but that the shot deviated from its intended and *supposed* elevation as much as it deviated from the intended vertical plane, and this without any opportunity of measuring or discovering the deviation. Now, when we have the whole range from one to three to choose among for our measure of resistance, it is evident that the confirmations which have been drawn from the ranges of shot are but feeble arguments for the truth of any opinion. Mr Robins finds his measures fully confirmed by the experiments at Metz and at Minorca. Mr Muller finds the same. Yet Mr Robins's measure both of the initial velocity and of the resistance are at least treble of Mr Muller's ; but by compensation they give the same results. The Chevalier Borda, a very expert mathematician, has adduced the very same experiments in support of his theory, in which he abides by the Newtonian measure of the resistance, which is about $\frac{1}{3}$ of Mr Robins's, and about $\frac{2}{3}$ of Muller's.

What are we to conclude from all this ? Simply this, ⁹⁰ that we have hardly any knowledge of the air's resistance, ^{Causes of its inutility.} and that even the solution given of this problem has not as yet greatly increased it. Our knowledge consists only in those experiments, and mathematicians are attempting to patch up some notion of the motion of a body in a resisting medium, which shall tally with them.

There is another essential defect in the conditions assumed in the solution. The density of the air is supposed uniform ; whereas we are certain that it is less by one fifth or one sixth towards the vertex of the curve, in many cases which frequently occur, than it is at the beginning and end of the flight. This is another latitude given to authors in their assumptions of the air's resistance. The Chevalier de Borda has, with considerable ingenuity, accommodated his investigation to this circumstance, by dividing the trajectory into portions, and, without much trouble, has made one equation answer them all. We are disposed to think that his solution of the problem (in the Memoirs of the Academy of Paris for 1769) corresponds better with the physical circumstances of the case than any other. But his process is there delivered in too concise a manner to be intelligible to a person not perfectly familiar with all the resources of modern analysis. We therefore preferred John Bernoulli's, because it is elementary and rigorous.

After all, the practical artilleryist must rely chiefly on the records of experiments contained in the books of practice

89
Shown
from va-
rious con-
siderations
to be very
little.

91
Necessity
attending
to experi-
ments.

practice at the academies, or those made in a more public manner. Even a perfect theory of the air's resistance can do him little service, unless the force of gunpowder were uniform. This is far from being the case even in the same powder. A few hours of a damp day will make a greater difference than occurs in any theory; and, in service, it is only by trial that every thing is performed. If the first shell falls very much short of the mark, a little more powder is added; and, in cannonading, the correction is made by varying the elevation.

We hope to be forgiven by the eminent mathematicians for these observations on their theories. They by no means proceed from any disrespect for their labours. We are not ignorant of the almost insuperable difficulty of the task, and we admire the ingenuity with which some of them have contrived to introduce into their analysis reasonable substitutions for those terms which would render the equations intractable. But we must still say, upon their own authority, that these are but ingenious guesses, and that experiment is the touchstone by which they mould their substitutions; and when they have found a coincidence, they have no motive to make any alteration. Now, when we have such a latitude for our measure of the air's resistance, that we may take it of any value, from one to three, it is no wonder that compensations of errors should produce a coincidence; but where is the coincidence? The theorist *supposes* the ball to set out with a certain velocity, and his theory gives a certain range; and this range agrees with observation—but how? Who knows the velocity of the ball in the experiment? This is concluded from a theory incomparably more uncertain than that of the motion in a resisting medium.

The experiments of Mr Robins and Dr Hutton show, in the most incontrovertible manner, that the resistance to a motion exceeding 1100 feet in a second, is almost *three times* greater than in the duplicate ratio to the resistance to moderate velocities. Euler's translator, in his comparison of the author's trajectories with experiment, supposes it to be *no* greater. Yet the coincidence is very great. The same may be said of the Chevalier de Borda's. Nay, the same may be said of Mr Robins's own practical rules: for he makes his *F*, which corresponds to our *a*, almost double of what these authors do, and yet his rules are confirmed by practice. Our observations are therefore well founded.

The theory
is still of
some use in
practice,

But it must not be inferred from all this, that the physical theory is of no use to the practical artilleryman. It plainly shows him the impropriety of giving the projectile an enormous velocity. This velocity is of no effect after 200 or 300 yards at farthest, because it is so rapidly reduced by the prodigious resistance of the air. Mr Robins has deduced several practical maxims of the greatest importance from what we already know of this subject, and which could hardly have been even conjectured without this knowledge. See GUNNERY.

93
And may
be brought
to greater
perfection.

And it must still be acknowledged, that this branch of physical science is highly interesting to the philosopher; nor should we despair of carrying it to greater perfection. The defects arise almost entirely from our ignorance of the law of variation of the air's resistance. Experiments may be contrived much more conducive to our information here than those commonly resorted

to. The oblique flights of projectiles are, as we have seen, of very complicated investigation, and ill fitted for instructing us; but numerous and well contrived experiments on the perpendicular ascents are of great simplicity, being affected by nothing but the air's resistance. To make them instructive, we think that the following plan might be pursued. Let a set of experiments be premised for ascertaining the initial velocities. Then let shells be discharged perpendicularly with great varieties of density and velocity, and let nothing be attended to but the height and the time; even a considerable deviation from the perpendicular will not affect either of these circumstances, and the effect of this circumstance can easily be computed. The height can be ascertained with sufficient precision for very valuable information by their light or smoke. It is evident that these experiments will give *direct* information of the air's retarding force; and every experiment gives us two measures, viz. the ascent and descent: and the comparison of the times of ascent or descent, combined with the observed height in one experiment made with a great initial velocity, will give us more information concerning the air's resistance than 50 ranges. If we should suppose the resistance as the square of the velocity, this comparison will give in each experiment an exact determination of the initial and final velocities, which no other method can give us. These, with experiments on the *time* of horizontal flights, with known initial velocities, will give us more instruction on this head than any thing that has yet been done; and till something of this kind is carefully done, we presume to say that the motion of bodies in a resisting medium will remain in the hands of the mathematicians as a matter of curious speculation. In the mean time, the rules which Mr Robins has delivered in his *Gunnery* are very simple and easy in their use, and seem to come as near the truth as any we have met with. He has not informed us upon what principles they are founded, and we are disposed to think that they are rather empirical than scientific. But we profess great deference for his abilities and penetration, and doubt not but that he had framed them by means of as scientific a discussion as his knowledge of this new and difficult subject enabled him to give it.

We shall conclude this article, by giving two or three tables, computed from the principles established above, and which serve to bring into one point of view the chief circumstances of the motion in a resisting medium. Although the result of much calculation, as any person who considers the subject will readily see, they must not be considered as offering any very accurate results; or that, in comparison with one or two experiments, the differences shall not be considerable. Let any person peruse the published registers of experiments which have been made with every attention, and he will see such enormous irregularities, that all expectations of perfect agreement with them must cease. In the experiments at Woolwich in 1735, which were continued for several days, not only do the experiments of one day differ among themselves, but the mean of all the experiments of one day differs from the mean of all the experiments of another no less than one fourth of the whole. The experiments in which the greatest regularity may be expected, are those made with great elevations. When the elevation is small, the range

95
Tables calculated on the preceding principles.

range is more affected by a change of velocity, and still more by any deviation from the supposed or intended direction of the shot.

The first table shows the distance in yards to which a ball projected with the velocity 1600 will go, while its velocity is reduced one tenth, and the distance at which it drops 16 feet from the line of its direction. This table is calculated by the resistance observed in Mr Robins's experiments. The first column is the weight of the ball in pounds. The second column remains the same whatever be the initial velocity; but the third column depends on the velocity. It is here given for the velocity which is very usual in military service, and its use is to assist us in directing the gun to the mark.— If the mark at which a ball of 24 pounds is directed is 474 yards distant, the axis of the piece must be pointed 16 feet higher than the mark. These deflections from the line of direction are nearly as the squares of the distances.

The next table contains the ranges in yards of a 24 pound shot, projected at an elevation of 45°, with the different velocities in feet per second, expressed in the first column. The second column contains the distances to which the ball would go in vacuo in a horizontal plane; and the third contains the distances to which it will go through the air. The fourth column is added, to show the height to which it rises in the air; and the fifth shows the ranges corrected for the diminution of the air's density as the bullet ascends, and may therefore be called the *corrected range*.

95
Use of the
last table.

The initial velocities can never be pushed as far as we have calculated for in this table; but we mean it for a table of more extensive use than appears at first sight. Recollect, that while the proportion of the ve-

VOL. XV.

locity at the vertex to the terminal velocity remains the same, the curves will be similar: therefore, if the initial velocities are as the square-roots of the diameters of the balls, they will describe similar curves, and the ranges will be as the diameters of the balls.

Therefore, to have the range of a 12 pound shot, if projected at an elevation of 45, with the velocity 1500; suppose the diameter of the 12 pounder to be d , and that of the 24 pounder D ; and let the velocities be v and V : Then say, $\sqrt{d} : \sqrt{D} = 1500$, to a fourth proportional V . If the 24 pounder be projected with the velocity V , It will describe a curve similar to that described by the 12 pounder, having the initial velocity 1500. Therefore find (by interpolation) the range of the 24 pounder, having the initial velocity V . Call this R . Then $D : d = R : r$, the range of the 12 pounder which was wanted, and which is nearly 3380 yards.

We see by this table the immense difference between the motions through the air and in a void. We see that the ranges through the air, instead of increasing in the duplicate ratio of the initial velocities, really increase slower than those velocities in all cases of military service; and in the most usual cases, viz. from 800 to 1600, they increase nearly as the square-roots of the velocities.

A set of similar tables, made for different elevations, would almost complete what can be done by theory, and would be much more expeditious in their use than Mr Euler's Trajectories, computed with great labour by his English translator.

The same table may also serve for computing the ranges of bomb-shells. We have only to find what must be the initial velocity of the 24 pound shot which corresponds to the proposed velocity of the shell. This must be deduced from the diameter and weight of the shell, by making the velocity of the 24 pounder such, that the ratio of its weight to the resistance may be the same as in the shell.

That the reader may see with one glance the relation of those different quantities, we have given this table, expressed in a figure (fig. 10). The abscissa, or axis DA , is the scale of the initial velocities in feet per second, measured on a scale of 400 equal parts in an inch. The ordinates to the curve ACG express the yards of the range on a scale containing 800 yards in an inch. The ordinates to the curve $A \times \gamma$ express (by the same scale) the height to which the ball rises in the air.

The ordinate BC (drawn through the point of the abscissa which corresponds to the initial velocity 2000 is divided in the points 4, 9, 12, 18, 24, 32, 42, in the ratio of the diameters of cannon-shot of different weights; and the same ordinate is produced on the other side of the axis, till BO be equal to BA ; and then BO is divided in the subduplicate ratio of the same diameters. Lines are drawn from the point A , and from any point D of the abscissa, to these divisions.

We see distinctly by this figure how the effect of the initial velocity gradually diminishes, and that in very great velocities the range is very little increased by its augmentation. The dotted curve $APQR$, shows what the ranges in vacuo would be.

By this figure may the problems be solved. Thus, to find the range of the 12 pounder, with the initial velocity

4 C

velocity

Plate

96
Relation of
the differ-
ent quan-
tities in it.

velocity 1500. Set off 1500 from B to F; draw FH parallel to the axis, meeting the line 12A in H; draw the ordinate HK; draw KL parallel to the axis, meeting 24 B in L; draw the ordinate LM, cutting 12 B in N. MN is the range required.

If curves, such as ACG, were laid down in the same manner for other elevations, all the problems might be solved with great dispatch, and with much more accuracy than the theory by which the curves are drawn can pretend to.

PROJECTION OF THE SPHERE.

Stereographic Projection of the Sphere.

THE PROJECTION of the SPHERE is a perspective representation of the circles on the surface of the sphere; and is variously denominated according to the different positions of the eye and plane of projection.

There are three principal points of projection; the *stereographic*, the *orthographic*, and *gnomonic*. In the stereographic projection the eye is supposed to be placed on the surface of the sphere; in the orthographic it is supposed to be at an infinite distance; and in the gnomonic projection the eye is placed at the centre of the sphere. Other kinds of its projection are, the *globular*, *Mercator's*, *scenographic*, &c. for which see the articles *GEOGRAPHY*, *NAVIGATION*, *PERSPECTIVE*, &c.

DEFINITIONS.

1. The plane upon which the circles of the sphere are described, is called the *plane of projection*, or the *primitive circle*. The pole of this circle is the *pole of projection*, and the place of the eye is the *projecting point*.

2. The *line of measures* of any circle of the sphere is that diameter of the primitive, produced indefinitely, which passes through the centre of the projected circle.

AXIOM.

The projection, or representation of any point, is where the straight line drawn from it to the projecting point intersects the plane of projection.

SECTION I.

Of the Stereographic Projection of the Sphere.

IN the stereographic projection of the sphere, the eye is placed on the surface of the sphere in the pole of the great circle upon which the sphere is to be projected. The projection of the hemisphere opposite to the eye falls within the primitive, to which this projection is generally limited: it, however, may be extended to the other hemisphere, or that wherein the eye is placed, the projection of which falls without the primitive.

As all circles in this projection are projected either into circles or straight lines, which are easily described, it is, therefore more generally understood, and by many preferred to the other projections.

PROPOSITION I. THEOREM I.

Every great circle which passes through the projecting point is projected into a straight line passing through the centre of the primitive; and every arch of it, reckoned from the other pole of the primitive, is projected into its semitangent.

Let ABCD (fig. 1.) be a great circle passing thro' A, C, the poles of the primitive, and intersecting it in the line of common section BED, E being the centre of the sphere. From A, the projecting point, let there be drawn straight lines AP, AM, AN, AQ, to any number of points P, M, N, Q, in the circle ABCD: these lines will intersect BED, which is in the same plane with them. Let them meet it in the points *p, m, n, q*; then *p, m, n, q*, are the projections of P, M, N, Q: hence the whole circle ABCD is projected into the straight line BED, passing through the centre of the primitive.

Again, because the pole C is projected into E, and the point M into *m*; therefore the arch CM is projected into the straight line Em, which is the semitangent of the arch CM to the radius AE. In the like manner, the arch CP is projected into its semitangent Ep, &c.

COROLLARIES.

1. Each of the quadrants contiguous to the projecting point is projected into an indefinite straight line, and each of those that are remote into a radius of the primitive.

2. Every small circle which passes through the projecting point is projected into that straight line which is its common section with the primitive.

3. Every straight line in the plane of the primitive, and produced indefinitely, is the projection of some circle on the sphere passing through the projecting point.

4. The projection of any point in the surface of the sphere, is distant from the centre of the primitive, by the semitangent of the distance of that point from the pole opposite to the projecting point.

PROPOSITION II. THEOREM II.

Every circle on the sphere which does not pass through the projecting point is projected into a circle.

If the given circle be parallel to the primitive, then a straight line drawn from the projecting point to any point in the circumference, and made to revolve about the circle, will describe the surface of a cone; which being cut by the plane of projection parallel to the base, the section will be a circle. See *Conic-Sections*.

But if the circle MN (fig. 2.) be not parallel to the primitive circle BD, let the great circle ABCD, passing through the projecting point, cut it at right angles in the diameter MN, and the primitive in the diameter BD. Through M, in the plane of the great circle, let MF be drawn parallel to BD; let AM, AN be joined and

Stereographic Projection of the Sphere.

Plate

CCCCIX.

Stereographic Projection of the Sphere.

Stereographic Projection of the Sphere.

and meet BD in mn . Then, because AB, AD are quadrants, and BD, MF parallel, the arch AM is equal to AF, and the angle AMF or $A mn$ is equal to ANM. Hence the conic surface described by the revolution of AM about the circle MN is cut by the primitive in a subcontrary position; therefore the section is in this case likewise a circle.

COROLLARIES.

1. The centres and poles of all circles parallel to the primitive have their projections in its centre.

2. The centre and poles of every circle inclined to the primitive have their projections in the line of measures.

3. All projected great circles cut the primitive in two points diametrically opposite; and every circle in the plane of projection, which passes through the extremities of a diameter of the primitive, or through the projections of two points that are diametrically opposite on the sphere, is the projection of some great circle.

4. A tangent to any circle of the sphere, which does not pass through the projecting point is projected into a tangent to that circle's projection; also, the circular projections of tangent circles touch one another.

5. The extremities of the diameter, on the line of measures of any projected circle, are distant from the centre of the primitive by the semitangents of the least and greatest distances of the circle on the sphere, from the pole opposite to the projecting point.

6. The extremities of the diameter, on the line of measures of any projected great circle, are distant from the centre of the primitive by the tangent and cotangent of half the great circle's inclination to the primitive.

7. The radius of any projected circle is equal to half the sum, or half the difference of the semitangents of the least and greatest distances of the circle from the pole opposite to the projecting point, according as that pole is within or without the given circle.

PROPOSITION III. THEOREM III.

An angle formed by two tangents at the same point in the surface of the sphere, is equal to the angle formed by their projections.

Plate
CCCCXIX. Let FGI and GH (fig. 3.) be the two tangents, and A the projecting point; let the plane AGF cut the sphere in the circle AGL, and the primitive in the line BML. Also, let MN be the line of common section of the plane AGH with the primitive: then the angle FGH=LMN. If the plane FGH be parallel to the primitive BLD, the proposition is manifest. If not, through any point K in AG produced, let the plane FKH, parallel to the primitive, be extended to meet FGH in the line FH. Then, because the plane AGF meets the two parallel planes BLD, FKH, the lines of common section LM, FK are parallel; therefore the angle AML=AKF. But since A is the pole of BLD, the chords, and consequently the arches AB AL, are equal, and the arch ABG is the sum of the arches AL, BG; hence the angle AML is equal to an angle at the circumference standing upon AG, and therefore equal to AGI or FGK; consequently the angle FGK=FKG, and the side FG=FK. In

like manner HG=HK: hence the triangles GHF, KHF are equal, and the angle FGH=FKH=LMN.

COROLLARIES.

1. An angle contained by any two circles of the sphere is equal to the angle formed by their projections. For the tangents to these circles on the sphere are projected into straight lines, which either coincide with, or are tangents to, their projections on the primitive.

2. An angle contained by any two circles of the sphere is equal to the angle formed by the radii of their projections at the point of intersection.

PROPOSITION IV. THEOREM IV.

The centre of a projected great circle is distant from the centre of the primitive; the tangent of the inclination of the great circle to the primitive, and its radius, is the secant of its inclination.

Let MNG (fig. 4.) be the projection of a great circle, meeting the primitive in the extremities of the diameter MN, and let the diameter BD, perpendicular to MN, meet the projection in F, G. Bisect FG in H, and join NH. Then, because any angle contained by two circles of the sphere is equal to the angle formed by the radii of their projections at the point of intersection; therefore the angle contained by the proposed great circle and the primitive is equal to the angle ENH, of which EH is the tangent, and NH the secant, to the radius of the primitive.

COROLLARIES.

2. All circles which pass through the points M, N are the projections of great circles, and have their centres in the line BG; and all circles which pass through the points F, G are the projections of great circles, and have their centres in the line HI, perpendicular to BG.

2. If NF, NH be continued to meet the primitive in L, F; then BL is the measure of the great circle's inclination to the primitive; and $MT=2BL$.

PROPOSITION V. THEOREM V.

The centre of projection of a less circle perpendicular to the primitive, is distant from the centre of the primitive, the secant of the distance of the less circle from its nearest pole; and the radius of projection is the tangent of that distance.

Let MN (fig. 5.) be the given less circle perpendicular to the primitive, and A the projecting point. Draw AM, AN to meet the diameter BD produced in G and H; then GH is the projected diameter of the less circle: bisect GH in C, and C will be its centre; join NE, NC. Then because AE, NI are parallel, the angle INE=NEA; but $NEA=2NMA=2NHG=2NCG$: hence $ENC=INE+INC=NCG+INC$ =a right angle; and therefore NC is a tangent to the primitive at N; but the arch ND is the distance of the less circle from its nearest pole D: hence NC is the tangent, and EC the secant of the distance of the less circle from its pole to the radius of the primitive.

PROPOSITION VI. THEOREM VI.

The projection of the poles of any circle, inclined to the primitive, are, in the line of measures, distant from the centre of the primitive, the tangent, and cotangent, or half its inclination.

Plate
CCCCXIX.

Let MN (fig. 6.) be a great circle perpendicular to the primitive ABCD, and A the projecting point; then P, p are the poles of MN, and of all its parallels $m n$, &c. Let AP, A p meet the diameter BD in F f , which will therefore be the projected poles of MN and its parallels. The angle BEM is the inclination of the circle MEN, and its parallels, to the primitive: and because BC and MP are quadrants, and MC common to both; therefore PC=BM: and hence PEC is also the inclination of MN and its parallels. Now EF is the tangent of EAF, or of half the angle PEC the inclination; and Ef is the tangent of the angle EAF; but EAF is the complement of EAF, hence Ef is the cotangent of half the inclination.

COROLLARIES.

1. The projection of that pole which is nearest to the projecting point is without the primitive, and the projection of the other within.
2. The projected centre of any circle is always between the projection of its nearest pole and the centre of the primitive; and the projected centres of all circles are contained between their projected poles.

PROPOSITION VII. THEOREM VII.

Equal arches of any two great circles of the sphere will be intercepted between two other circles drawn on the sphere through the remote poles of those great circles.

Let AGB, CFD (fig. 7.) be two great circles of the sphere, whose remote poles are E, P; through which draw the great circle PBEC, and less circle PGE, intersecting the great circles AGB, CFD, in the points B, G, and D, F; then the arch BG is equal to the arch DF.

Because E is the pole of the circle AGB, and P the pole of CFD, therefore the arches EB, PD are equal; and since BD is common to both, hence the arch ED is equal to the arch PB. For the same reason, the arches EF, PG are equal; but the angle DEF is equal to the angle BPG: hence these triangles are equal, and therefore the arch DF is equal to the arch BG.

PROPOSITION VIII. THEOREM VIII.

If from either pole of a projected great circle, two straight lines be drawn to meet the primitive and the projection, they will intercept similar arches of these circles.

On a plane of projection AGB (fig. 7.) let the great circle CFD be projected into $cf d$, and its pole P into p ; through p draw the straight lines $p d$, $p f$, then are the arches GB, $f d$ similar.

Since $p d$ lies both in the plane AGB and APBE, it is in their common section, and the point B is also in their common section; therefore $p d$ passes through the point B. In like manner it may be shown that the line $p f$ passes through G. Now the points D, F

are projected into d, f : hence the arches FD, $f d$ are similar; but GB is equal to FD, therefore the intercepted arch of the primitive GB is similar to the projected arch $f d$.

COROLLARY.

Hence, if from the angular point of a projected spherical angle two straight lines be drawn through the projected poles of the containing sides, the intercepted arch of the primitive will be the measure of the spherical angle.

PROPOSITION IX. PROBLEM I.

To describe the projection of a great circle through two given points in the plane of the primitive.

Let P and B be given points, and C the centre of the primitive.

1. When one point P (fig. 8.) is the centre of the primitive, a diameter drawn through the given points will be the great circle required.

2. When one point P (fig. 9.) is in the circumference of the primitive. Through P draw the diameter PD; and an oblique circle described through the three points P, B, D, will be the projection of the required great circle.

3. When the given points are neither in the centre nor circumference of the primitive. Through either of the given points P (fig. 10.) draw the diameter ED, and at right angles thereto draw the diameter FG. From F through P draw the straight line FPH, meeting the circumference in H: draw the diameter HI, and draw the straight line FIK, meeting ED produced in D; then an arch, terminated by the circumference, being described through the three points P, B, K, will be the great circle.

PROPOSITION X. PROBLEM II.

To describe the representation of a great circle about any given point as a pole.

Let P be the given pole, and C the centre of the primitive.

1. When P (fig. 8.) is in the centre of the primitive, then the primitive will be the great circle required.

2. When the pole P (fig. 11.) is in the circumference of the primitive. Through P draw the diameter PE, and the diameter AB drawn at right angles to PE will be the projected great circle required.

3. When the given pole is neither in the centre nor circumference of the primitive. Through the pole P (fig. 12.) draw the diameter AB, and draw the diameter DE perpendicular to AB; through E and P draw the straight line EPF, meeting the circumference in F. Make FC equal to FD; through E and G draw the straight line EGH, meeting the diameter AB produced if necessary in H; then from the centre H, with the radius HE, describe the oblique circle DIE, and it will be the projection of the great circle required.

Or, make DK equal to FA; join EK, which intersects the diameter AB in I; then through the three points D, I, E, describe the oblique circle DIE.

PROPOSITION XI. PROBLEM III.

To find the poles of a great circle.

1. When the given great circle is the primitive, its centre is the pole.

2. To

Stereographic Projection of the Sphere.

Stereographic Projection of the Sphere.

Plate
CCCCXIX.
Plate
CCCCXX.

2. To find the pole of the right circle ABC (fig. 11.) Draw the diameter PE perpendicular to the given circle AB; and its extremities P, E are the poles of the circle ACB.

3. To find the pole of the oblique circle DEF (fig. 13.) Join DF, and perpendicular thereto draw the diameter AB, cutting the given oblique circle DEF in E. Draw the straight line FEG, meeting the circumference in G. Make GI GH, each equal to AD; then FI being joined, cuts the diameter AB in P, the lower pole; through F and H draw the straight line FH p , meeting the diameter AB produced in p , which will be the opposite or exterior pole.

PROPOSITION XII. PROBLEM IV.

To describe a less circle about any given point as a pole, and at any given distance from that pole.

1. When the pole of the less circle is in the centre of the primitive; then from the centre of the primitive, with the semitangent of the distance of the given circle from its pole, describe a circle, and it will be the projection of the less circle required.

2. If the given pole is in the circumference of the primitive, from C (fig. 14.), the centre of the primitive, set off CE the secant of the distance of the less circle from its pole P; then from the centre E, with the tangent of the given distance, describe a circle, and it will be the less circle required. Or, make PG, PF each equal to the chord of the distance of the less circle from its pole. Through B, G, draw the straight line BGD meeting CP produced in D; bisect GD in H, and draw HE perpendicular to GD; and meeting PD in E, then E is the centre of the less circle.

3. When the given pole is neither in the centre nor circumference of the primitive. Through P (fig. 15.), the given pole, and C the centre of the primitive, draw the diameter AB, and draw the diameter DE perpendicular to AB; join EP, and produce it to meet the primitive in p ; make pF , pG , each equal to the chord of the distance of the less circle from its pole; join EF which intersects the diameter AB in H; from E through G draw the straight line EGI, meeting the diameter AB produced in I; bisect HI in K. Then a circle described from the centre K, at the distance KH or KI, will be the projection of the less circle.

PROPOSITION XIII. PROBLEM V.

To find the poles of a given less circle.

The poles of a less circle are also those of its parallel great circle. If therefore the parallel great circle be given, then its poles being found by Prob. III. will be those of the less circle. But if the parallel great circle be not given, let HMIN (fig. 15.) be the given less circle. Through its centre, and C the centre of the primitive, draw the line of measures IAHB; and draw the diameter DE perpendicular to it, also draw the straight line EHF meeting the primitive in F; make Fp equal to the chord of the distance of the less circle from its pole; join Ep , and its intersection P with the diameter AB is the interior pole. Draw the diameter pCL through E and L, draw EL q meeting the diameter AB produced in q ; then q is the external pole. Or thus: Join EI intersecting the primitive in G; join also EH, and produce it to meet the primitive in F, bisect

the arch GF in p ; from E to p draw the straight line Ep , and P is the pole of the given less circle.

PROPOSITION XIV. PROBLEM VI.

To measure any arch of a great circle.

1. Arches of the primitive are measured on the line of chords.

2. Right circles are measured on the line of semitangents, beginning at the centre of the primitive. Thus, the measure of the portion AC (fig. 16.) of the right circle DE, is found by applying it to the line of semitangents. The measure of the arch DB is found by subtracting that of BC from 90° : the measure of the arch AF, lying partly on each side of the centre, is obtained by adding the measures of AC and CF. Lastly, To measure the part AB, which is neither terminated at the centre or circumference of the primitive, apply CA to the line of semitangents; then CB, and the difference between the measures of these arches, will be that of AB.

Or thus, Draw the diameter GH perpendicular to DE; then from either extremity, as D, of this diameter, draw lines through the extremities of the arch intended to be measured; and the intercepted portion of the primitive applied to the line of chords will give the measure of the required arch. Thus IK applied to the line of chords will give the measure of AB.

3. To measure an arch of an oblique circle: draw lines from its pole through the extremities of the arch to meet the primitive, then the intercepted portion of the primitive applied to the line of chords will give the measure of the arch of the oblique circle. Thus, let AB (fig. 17.), be an arch of an oblique circle to be measured, and P its pole; from P draw the lines PAD, PBE meeting the primitive in B and E; then the arch DE applied to the line of chords will give the measure of the arch of the oblique circle AB.

PROPOSITION XV. PROBLEM VII.

To measure any arch of a less circle.

Let DEG (fig. 18.) be the given less circle, and DE the arch to be measured: find its internal pole P; and describe the circle AFI parallel to the primitive, and whose distance from the projecting point may be equal to the distance of the given less circle from its pole P: then join PD, PE, which produce to meet the parallel circle in A and F. Now AF applied to a line of chords will give the measure of the arch DE of the given less circle.

PROPOSITION XVI. PROBLEM VIII.

To measure any spherical angle.

1. If the angle is at the centre of the primitive, it is measured as a plane angle.

2. When the angular point is in the circumference of the primitive; let A (fig. 19.) be the angular point, and ABE an oblique circle inclined to the primitive. Through P, the pole of ABE, draw the line AP p meeting the circumference in p ; then the arch Ep is the measure of the angle BAD, and the arch AF p is the measure of its supplement BAF: also pF is the measure of the angle BAC, and pED that of its supplement.

PROJECTION OF THE SPHERE.

Sect. I.

3. If the angular point is neither at the centre nor circumference of the primitive. Let A (fig. 20.) be the angular point, and DAH , or GAF the angle to be measured, P the pole of the oblique circle DAF , and p the pole of GAH : then from A , through the points Pp , draw the straight lines APM , $A p N$, and the arch MN will be the measure of the angle DAH ; and the supplement of MN will be the measure of the angle HAF or DAG .

PROPOSITION XVII. PROBLEM IX.

To draw a great circle perpendicular to a projected great circle, and through a point given in it.

Find the pole of the given circle, then a great circle described through that pole and the given point will be perpendicular to the given circle. Hence if the given circle be the primitive, then a diameter drawn through the given point will be the required perpendicular. If the given circle is a right one, draw a diameter at right angles to it; then through the extremities of this diameter and the given point describe an oblique circle, and it will be perpendicular to that given. If the given circle is inclined to the primitive, let it be represented by BAD (fig. 21.), whose pole is P , and let A be the point through which the perpendicular is to be drawn: then, by Prob. I. describe a great circle through the points P and A , and it will be perpendicular to the oblique circle BAD .

PROPOSITION XVIII. PROBLEM X.

Through a point in a projected great circle, to describe another great circle to make a given angle with the former, provided the measure of the given angle is not less than the distance between the given point and circle.

Let the given circle be the primitive, and let A (fig. 19.) be the angular point. Draw the diameters AE , DF perpendicular to each other; and make the angle CAG equal to that given, or make CG equal to the tangent of the given angle; then from the centre G , with the distance GC , describe the oblique circle ABE , and it will make with the primitive an angle equal to that given.

If the given circle be a right one, let it be APB (fig. 22.) and let P be the given point. Draw the diameter GH perpendicular to AB ; join GP , and produce it to a ; make Hb equal to twice Aa ; and Gb being joined intersects AB in C . Draw CD perpendicular to AB , and equal to the cotangent of the given angle to the radius PC ; or make the angle CPD equal to the complement of that given: then from the centre D , with the radius DP , describe the great circle FPE , and the angle APF , or BPE , will be equal to that given.

If APB (fig. 23.) is an oblique circle. From the angular point P , draw the lines PG , PC through the centres of the primitive and given oblique circle. Through C , the centre of APB , draw GCD at right angles to PG ; make the angle GPD equal to that given; and from the centre D , with the radius DP , describe the oblique circle FPE , and the angle APF , or BPE , will be equal to that proposed.

PROPOSITION XIX. PROBLEM XI.

Any great circle cutting the primitive being given, to

describe another great circle which shall cut the given one in a proposed angle, and have a given arch intercepted between the primitive and given circles.

If the given circle be a right one, let it be represented by APC (fig. 24.); and at right angles thereto draw the diameter BPM ; make the angle BPF equal to the complement of the given angle, and PF equal to the tangent of the given arch; and from the centre of the primitive with the secant of the same arch describe the arch Gg . Through F draw FG parallel to AC , meeting Gg in G ; then from the centre G , with the tangent PF , describe an arch no , cutting APC in I , and join GI . Through G , and the centre P , draw the diameter HK ; draw PL perpendicular to HK , and IL perpendicular to GI , meeting PL in L ; then L will be the centre of the circle HIK , which is that required.

But if the given great circle be inclined to the primitive, let it be ADB (fig. 25.), and E its centre: make the angle BDF equal to the complement of that given, and DF equal to the tangent of the given arch, as before. From P , the centre of the primitive, with the secant of the same arch, describe the arch Gg , and from E , the centre of the oblique circle, with the extent EF , describe an arch intersecting Gg in G . Now G being determined, the remaining part of the operation is performed as before.

When the given arch exceeds 90° , the tangent and secant of its supplement are to be applied on the line DF the contrary way, or towards the right; the former construction being reckoned to the left.

PROPOSITION XX. PROBLEM XII.

Any great circle in the plane of projection being given to describe another great circle, which shall make given angles with the primitive and given circles.

Let ADC (fig. 26.) be the given circle, and Q its pole. About P , the pole of the primitive, describe an arch mn , at the distance of as many degrees as are in the angle which the required circle is to make with the primitive. About Q the pole of the circle ADC , and at a distance equal to the measure of the angle which the required circle is to make with the given circle ADC , describe an arch on , cutting mn in n . Then about n as a pole, describe the great circle EDF , cutting the primitive and given circle in E and D , and it will be the great circle required.

SCHOLIUM.

It will hence be an easy matter to construct all the various spherical triangles. The reader is, however, referred to the article *Spherical TRIGONOMETRY*, for the method of constructing them agreeable to this projection; and also for the application to the resolution of problems of the sphere. For the method of projecting the sphere upon the plane of the meridian, and of the horizon, according to the stereographic projection, see the article *GEOGRAPHY*.

SECTION II.

Of the Orthographic Projection of the Sphere.

THE orthographic projection of the sphere, is that in which the eye is placed in the axis of the plane of projection,

Orthographic Projection of the Sphere.

Orthographic Projection of the Sphere.

jection, at an infinite distance with respect to the diameter of the sphere; so that at the sphere all the visual rays are assumed parallel, and therefore perpendicular to the plane of projection.

Hence the orthographic projection of any point is where a perpendicular from that point meets the plane of projection: and the orthographic representation of any object is the figure formed by perpendiculars drawn from every point of the object to the plane of projection.

This method of projection is used in the geometrical delineation of eclipses, occultations, and transits. It is also particularly useful in various other projections, such as the analemma. See GEOGRAPHY, &c.

PROPOSITION I. THEOREM I.

Every straight line is projected into a straight line. If the given line be parallel to the plane of projection, it is projected into an equal straight line; but if it is inclined to the primitive, then the given straight line will be to its projection in the ratio of the radius to the cosine of inclination.

Plate CCCXXI.

Let AB (fig. 27.) be the plane of projection, and let CD be a straight line parallel thereto: from the extremities C, D of the straight line CD, draw the lines CE, DF perpendicular to AB; then by 3. of XI. of Eucl. the intersection EF, of the plane CEFD, with the plane of projection, is a straight line: and because the straight lines CD, EF are parallel, and also CE, DF; therefore, by 34. of I. of Eucl. the opposite sides are equal; hence the straight line CD, and its projection EF, are equal. Again, let GH be the proposed straight line, inclined to the primitive; then the lines GE, HF being drawn perpendicular to AB, the intercepted portion EF will be the projection of GH. Through G draw GI parallel to AB, and the angle IGH will be equal to the inclination of the given line to the plane of projection. Now GH being the radius, GI, or its equal EF, will be the cosine of IGH; hence the given line GH is to its projection EF as radius to the cosine of inclination.

COROLLARIES.

1. A straight line perpendicular to the plane of projection is projected into a point.
2. Every straight line in a plane parallel to the primitive is projected into an equal and parallel straight line.
3. A plane angle parallel to the primitive is projected into an equal angle.
4. Any plane rectilineal figure parallel to the primitive is projected into an equal and similar figure.
5. The area of any rectilineal figure is to the area of its projection as radius to the cosine of its inclination.

PROPOSITION II. THEOREM II.

Every great circle, perpendicular to the primitive, is projected into a diameter of the primitive; and every arch of it, reckoned from the pole of the primitive, is projected into its sine.

Let BFD (fig. 28.) be the primitive, and ABCD a great circle perpendicular to it, passing through its poles A, C; then the diameter BED, which is their

line of common section, will be the projection of the circle ABCD. For if from any point, as G, in the circle ABC, a perpendicular GH fall upon BD, it will also be perpendicular to the plane of the primitive: therefore H is the projection of G. Hence the whole circle is projected into BD, and any arch AG into EH equal to GI its sine.

COROLLARIES.

1. Every arch of a great circle, reckoned from its intersection with the primitive, is projected into its versed sine.
2. Every less circle perpendicular to the primitive is projected into its line of common section with the primitive, which is also its own diameter; and every arch of the semicircle above the primitive, reckoned from the middle point, is projected into its sine.
3. Every diameter of the primitive is the projection of a great circle; and every chord the projection of a less circle.
4. A spherical angle at the pole of the primitive is projected into an equal angle.

PROPOSITION III. THEOREM III.

A circle parallel to the primitive is projected into a circle equal to itself, and concentric with the primitive.

Let the less circle FIG (fig. 29.) be parallel to the plane of the primitive BND. The straight line HE, which joins their centres, is perpendicular to the primitive; therefore E is the projection of H. Let any radii HI and IN perpendicular to the primitive be drawn. Then IN, HE being parallel, are in the same plane; therefore IH, NE, the lines of common section of the plane IE, with two parallel planes, are parallel; and the figure IHEN is a parallelogram. Hence NE = IH, and consequently FIG is projected into an equal circle KNL, whose centre is E.

COROLLARY.

The radius of the projection is the cosine of the distance of the parallel circle from the primitive, or the sine of its distance from the pole of the primitive.

PROPOSITION IV. THEOREM IV.

An inclined circle is projected into an ellipse, whose transverse axis is the diameter of the circle.

1. Let ELF (fig. 30.) be a great circle inclined to the primitive EBF, and EF their line of common section. From the centre C, and any other point K, in EF, let the perpendiculars CB, KI be drawn in the plane of the primitive, and CL, KN, in the plane of the great circle, meeting the circumference in L, N. Let LG, ND be perpendicular to CB, KI; then G, D are the projections of L, N. And because the triangles LCG, NKD are equiangular, $CL^2 : CG^2 :: NK^2 : DK^2$; or $EC^2 : CG^2 :: EK^2 : DK^2$: therefore the points G, D are in the curve of an ellipse, of which EF is the transverse axis, and CG the semiconjugate axis.

COROLLARIES.

1. In a projected great circle, the semiconjugate axis is the cosine of the inclination of the great circle to the primitive.

2. Per-

Orthographic Projection of the Sphere.

Plate

ccccxxi.

2. Perpendiculars to the transverse axis intercept corresponding arches of the projection and the primitive.

3. The eccentricity of the projection is the sine of the inclination of the great circle to the primitive.

Case 2. Let AQB (fig. 31.) be a less circle, inclined to the primitive, and let the great circle LBM , perpendicular to both, intersect them in the lines AB, LM . From the centre O and any other point N in the diameter AB , let the perpendiculars TOP, NQ , be drawn in the plane of the less circle, to meet its circumference in T, P, Q . Also, from the points A, N, O, B , let AG, NI, OC, BH , be drawn perpendicular to LM ; and from P, Q, T , draw PE, QD, TF perpendicular to the primitive; then G, I, C, H, E, D, F , are the projections of these points. Because OP is perpendicular to LBM , and OC, PE , being perpendicular to the primitive, are in the same plane, the plane $COPE$ is perpendicular to LBM . But the primitive is perpendicular to LBM ; therefore the common section EC is perpendicular to LBM , and to LM . Hence CP is a parallelogram, and $EC = OP$. In like manner, FC, DI , are proved perpendicular to LM , and equal to OT, NQ . Thus, ECF is a straight line, and equal to the diameter PT . Let QR, DK be parallel to AB, LM ; then $RO = NQ = DI = KC$, and $PR \times RT = EK \times KF$. But $AO : CG :: NO : CI$; therefore $AO^2 : CG^2 :: QR^2 : DK^2$ and $EC^2 : CG^2 :: EKF : DK^2$.

COROLLARIES.

1. The transverse axis is to the conjugate as radius to the cosine of the circle's inclination to the primitive.
2. Half the transverse axis is the cosine of half the sum of the greatest and least distances of the less circle from the primitive.
3. The extremities of the conjugate axis are in the line of measures, distant from the centre of the primitive by the cosines of the greatest and least distances of the less circle from the primitive.
4. If from the extremities of the conjugate axis of any elliptical projection perpendiculars be drawn (in the same direction if the circle do not intersect the primitive, but if otherwise in opposite directions), they will intersect an arch of the primitive, whose chord is equal to the diameter of the circle.

PROPOSITION V. THEOREM V.

The projected poles of an inclined circle are in its line of measures distant from the centre of the primitive the sine of the inclination of the circle to the primitive.

Let $ABCD$ (fig. 32.) be a great circle, perpendicular both to the primitive and the inclined circle, and intersecting them in the diameters AC, MN . Then $ABCD$ passes through the poles of the inclined circle; let these be P, Q ; and let Pp, Qq , be perpendicular to AC ; p, q are the projected poles; and it is evident that $pO = \text{fine of } BP$, or MA , the inclination.

COROLLARIES.

1. The centre of the primitive, the centre of the projection, the projected poles, and the extremities of the conjugate axis, are all in one and the same straight line.
2. The distance of the centre of projection from the

centre of the primitive, is to the cosine of the distance of the circle from its own pole, as the sine of the circle's inclination to the primitive is to the radius.

Orthographic Projection of the Sphere.

PROPOSITION VI. PROBLEM I.

To describe the projection of a circle perpendicular to the primitive, and whose distance from its pole is equal to a given quantity.

Let $PApB$ (fig. 33.) be the primitive circle, and P, p the poles of the right circle to be projected. Then if the circle to be projected is a great circle, draw the diameter AB at right angles to the axis Pp , and it will be that required. But if the required projection is that of a less circle, make PE, PF each equal to the chord of the distance of the less circle from its pole; join EF , and it will be the projection of the less circle required.

PROPOSITION VII. PROBLEM II.

Through a given point in the plane of the primitive to describe the projection of a great circle, having a given inclination to the primitive.

1. When the given inclination is equal to a right angle, a straight line drawn through the centre of the primitive and the given point will be the projection required.

2. When the given inclination is less than a right angle, and the given point in the circumference of the primitive. Let R (fig. 34.) be a point given in the circumference of the primitive, through which it is required to draw the projection of a great circle, inclined to the primitive in an angle measured by the arch QP of the primitive.

Through the given point R draw the diameter RCS , and draw GCg at right angles to it. Make the arch GV of the primitive equal to QP , and draw VA at right angles to GC ; and in Gg , towards the opposite parts of C , take CB equal to AC ; then, with the greater axis RS , and less axis AB , describe an ellipse, and it will be the projection of the oblique circle required.

3. When the distance of the given point from the primitive is equal to the cosine of the given inclination.

Every thing remaining as in the preceding case; let A be the given point, and AC the cosine of an arch GV , equal to the given arch QP ; then drawing the diameter RCS at right angles to ACB , the ellipse described with the given axis RS, AB will be the projection of the inclined circle.

4. When the distance of the given point from the centre of the primitive is less than the semidiameter of the primitive, but greater than the cosine of the given inclination.

Let D be the given point, through which draw the diameter ICi ; and at the point D draw DL perpendicular to DC meeting the primitive in L ; also draw LK , making with LD the angle DLK equal to the complement of the given inclination. Let LK meet DC in K ; then will DK be less than DC . On DC as a diameter describe a circle, and make DH equal to DK ; through H draw a diameter of the primitive RCS , and describe an ellipse through the points R, D, S , and it will be the projection of the inclined circle.

Pro.

Orthographic Projection of the Sphere.

PROPOSITION VIII. PROBLEM III.

Through two given points in the plane of the primitive to describe the projection of a great circle.

1. If the two given points and the centre of the primitive be in the same straight line, then a diameter of the primitive being drawn through these points will be the projection of the great circle required.

2. When the two given points are not in the same straight line with the centre of the primitive; and one of them is in the circumference of the primitive.

Plate
ccccxxi. Let D, R, (fig. 34.) be the two given points, of which R is in the circumference of the primitive. Draw the diameter RCS, and GCg, FDH perpendicular to it, meeting the primitive in GgF. Divide GC, gC, in A, B, in the same proportion as FH is divided in D; and describe the ellipse whose axes are RS, AB, and centre C; and it will be the projection required.

3. When the given points are within the primitive, and not in the same straight line with its centre.

Let D, E (fig. 35.) be the two given points; through C the centre of the primitive draw the straight lines IDi, KEi; draw DL perpendicular to Ii, and EO perpendicular to Kk, meeting the primitive in L, O. Through E, and towards the same parts of C, draw EP parallel to DC, and in magnitude a fourth proportional to LD, DC, OE. Draw the diameter CP meeting the primitive in R, S, and describe an ellipse through the points D and R or S, and it will also pass through E. This ellipse will be the projection of the proposed inclined circle.

PROPOSITION IX. PROBLEM IV.

To describe the projection of a less circle parallel to the primitive, its distance from the pole of the primitive being given.

From the pole of the primitive, with the sine of the given distance of the circle from its pole, describe a circle, and it will be the projection of the given less circle.

PROPOSITION X. PROBLEM V.

About a given point as a projected pole to describe the projection of an inclined circle, whose distance from its pole is given.

Let P (fig. 36.) be the given projected pole, through which draw the diameter Gg, and draw the diameter Hh perpendicular thereto. From P draw PL perpendicular to GP meeting the circumference in L; through which draw the diameter Ll. Make LT, LK each equal to the chord of the distance of the less circle from its pole, and join TK, which intersects Ll in Q. From the points T, Q, K draw the lines FA, QS, KB, perpendicular to Gg; and make OR, OS, each equal to QT, or QK. Then an ellipse described through the points A, S, B, R will be the projection of the proposed less circle.

PROPOSITION XI. PROBLEM VI.

To find the poles of a given projected circle.

1. If the projected circle be parallel to the primitive, the centre of the primitive will be its pole.

VOL. XV.

2. If the circle be perpendicular to the primitive, then the extremities of a diameter of the primitive drawn at right angles to the straight line representing the projected circle, will be the poles of that circle.

3. When the projected circle is inclined to the primitive.

Let ARBS (fig. 36, 37.) be the elliptical projection of any oblique circle; through the centre of which, and C the centre of the primitive, draw the line of measures CBA, meeting the ellipse in B, A; and the primitive in G, g. Draw CH, BK, AT perpendicular to Gg, meeting the primitive in H, K, T. Bisect the arch KT in L, and draw LP perpendicular to Gg; then P will be the projected pole of the circle, of which ARBS is the projection.

PROPOSITION XII. PROBLEM VII.

To measure any portion of a projected circle, and conversely.

1. When the given projection is that of a great circle.

Let ADEB (fig. 38.) be the given great circle, either perpendicular or inclined to the primitive, of which the portion DE is to be measured, and let Mm be the line of measures of the given circle. Through the points D, E draw the lines EG, DF parallel to Mm; and the arch FG of the primitive will be the measure of the arch DE of the great circle, and conversely.

2. When the projection is that of a less circle parallel to the primitive.

Let DE (fig. 39.) be the portion to be measured, of the less circle DEH parallel to the primitive. From the centre C draw the lines CD, CE, and produce them to meet the primitive in the points B, F. Then the intercepted portion BF of the primitive will be the measure of the given arch DE of the less circle DEH.

3. If the given less circle, of which an arch is to be measured, is perpendicular to the primitive.

Let ADEB (fig. 40.) be the less circle, of which the measure of the arch DE is required. Through C, the centre of the primitive, draw the line of measures Mm, and from the intersection O of the given right circle, and the line of measures, with the radius OA, or OB, describe the semicircle AFGB; through the points D, E draw the lines DF, EG parallel to the line of measures, and the arch FG will be the measure of DE, to the radius AO. In order to find a similar arch in the circumference of the primitive, join OF, OG, and at the centre C of the primitive, make the angle mCH equal to FOG, and the arch mH to the radius Cm will be the measure of the arch DE.

4. When the given projection is of a less circle inclined to the primitive.

Let RDS (fig. 41.) be the projection of a less circle inclined to the primitive, and DE a portion of that circle to be measured. Through O the centre of the projected circle, and C the centre of the primitive, draw the line of measures Mm; and from the centre O, with the radius OR, or OS, describe the semicircle RGFS; through the points D, E draw the lines DF, EG parallel to the line of measures, and FG will be the measure of the arch DE to the radius OR, or OS. Join OF, OG, and make the angle mCH equal to FOG,

Plate
ccccxxii.

Gnomonic Projection of the Sphere. FOC, and the arch mH of the primitive will be the measure of the arch DE of the inclined circle RDS .

The converse of this proposition, namely, to cut off an arch from a given projected circle equal to a given arch of the primitive, is obvious.

The above operation would be greatly shortened by using the line of sines in the sector.

It seems unnecessary to insist farther on this projection, especially as the reader will see the application of it to the projection of the sphere on the planes of the *Meridian*, *Equator*, and *Horizon* in the article *GEOGRAPHY*; and to the delineation of *Ellipses* in the article *ASTRONOMY*. The *Analemma*, Plate CCXII. in the article *GEOGRAPHY*, is also according to this projection; and the method of applying it to the solution of astronomical problems is there exemplified.

SECTION III.

Of the Gnomonic Projection of the Sphere.

In this projection the eye is in the centre of the sphere, and the plane of projection touches the sphere in a given point parallel to a given circle. It is named *gnomonic*, on account of its being the foundation of dialling: the plane of projection may also represent the plane of a dial, whose centre being the projected pole, the semiaxis of the sphere will be the stile or gnomon of the dial.

As the projection of great circles are represented by straight lines, and less circles parallel to the plane of projection are projected into concentric circles; therefore many problems of the sphere are very easily resolved. Other problems, however, become more intricate on account of some of the circles being projected into ellipses, parabolas, and hyperbolas.

PROPOSITION I. THEOREM I.

Every great circle is projected into a straight line perpendicular to the line of measures; and whose distance from the centre is equal to the cotangent of its inclination, or to the tangent of its nearest distance from the pole of the projection.

Plate
CCCXII.

Let BAD (fig. 42.) be the given circle, and let the circle $CBED$ be perpendicular to BAD , and to the plane of projection; whose intersection CF with this last plane will be the line of measures. Now since the circle $CBED$ is perpendicular both to the given circle BAD and to the plane of projection, the common section of the two last planes produced will therefore be perpendicular to the plane of the circle $CBED$ produced, and consequently to the line of measures; hence the given circle will be projected into that section; that is, into a straight line passing through d , perpendicular to Cd . Now Cd is the cotangent of the angle CdA , the inclination of the given circle, or the tangent of the arch CD to the radius AC .

COROLLARIES.

1. A great circle perpendicular to the plane of projection is projected into a straight line passing through the centre of projection; and any arch is projected into its correspondent tangent.

2. Any point, as D , or the pole of any circle, is

projected into a point d , whose distance from the pole of projection is equal to the tangent of that distance.

3. If two great circles be perpendicular to each other, and one of them passes through the pole of projection, they will be projected into two straight lines perpendicular to each other.

4. Hence if a great circle be perpendicular to several other great circles, and its representation pass through the centre of projection; then all these circles will be represented by lines parallel to one another, and perpendicular to the line of measures, for representation of that first circle.

PROPOSITION II. THEOREM II.

If two great circles intersect in the pole of projection, their representations will make an angle at the centre of the plane of projection, equal to the angle made by these circles on the sphere.

For since both these circles are perpendicular to the plane of projection, the angle made by their intersections with this plane is the same as the angle made by these circles.

PROPOSITION III. THEOREM III.

Any less circle parallel to the plane of projection is projected into a circle whose centre is the pole of projection, and its radius is equal to the tangent of the distance of the circle from the pole of projection.

Let the circle PI (fig. 42) be parallel to the plane GF , then the equal arches PC , CI are projected into the equal tangents GC , CH ; and therefore C , the point of contact and pole of the circle PI and of the projection, is the centre of the representation G , H .

COROLLARY.

If a circle be parallel to the plane of projection, and 45 degrees from the pole, it is projected into a circle equal to a great circle of the sphere; and therefore may be considered as the primitive circle, and its radius the radius of projection.

PROPOSITION IV. THEOREM IV.

A less circle not parallel to the plane of projection is projected into a conic section, whose transverse axis is in the line of measures; and the distance of its nearest vertex from the centre of the plane of projection is equal to the tangent of its nearest distance from the pole of projection; and the distance of the other vertex is equal to the tangent of the greatest distance.

Any less circle is the base of a cone whose vertex is at A (fig. 43.); and this cone being produced, its intersection with the plane of projection will be a conic section. Thus the cone DAF , having the circle DF for its base, being produced, will be cut by the plane of projection in an ellipse whose transverse diameter is df ; and Cd is the tangent of the angle CAD , and Cf the tangent of CAF . In like manner, the cone AfE , having the side AE parallel to the line of measures df , being cut by the plane of projection, the section will be a parabola, of which f is the nearest vertex,

Gnomonic Projection of the Sphere. tex, and the point into which E is projected is at an infinite distance. Also the cone AFG, whose base is the circle FG, being cut by the plane of projection, the section will be a hyperbola; of which *f* is the nearest vertex; and GA being produced gives *d* the other vertex.

COROLLARIES.

1. A less circle will be projected into an ellipse, a parabola, or hyperbola, according as the distance of its most remote point is less, equal to, or greater than, 90 degrees.

2. If H be the centre, and K, *k*, *l* the focus of the ellipse, hyperbola, or parabola; then $HK = \frac{Ad - Af}{2}$

for the ellipse; $Hk = \frac{Ad + Af}{2}$ for the hyperbola;

and *fn* being drawn perpendicular to AE $fl = \frac{nE + Ff}{2}$ for the parabola.

PROPOSITION V. THEOREM V.

Plate cccxxii. Let the plane TW (fig. 44.) be perpendicular to the plane of projection TV, and BCD a great circle of the sphere in the plane TW. Let the great circle BED be projected into the straight line *bek*. Draw CQS perpendicular to *bk*, and *Cm* parallel to it and equal to CA, and make QS equal to *Qm*; then any angle QSt is the measure of the arch Qt of the projected circle.

Join AQ; then because *Cm* is equal to CA, the angle QCM equal to QCA, each being a right angle, and the side QC common to both triangles; therefore *Qm*, or its equal QS, is equal QA. Again, since the plane ACQ is perpendicular to the plane TV, and *bQ* to the intersection CQ; therefore *bQ* is perpendicular both to AQ and QS: hence, since AQ and QS are equal, all the angles at S cut the line *bQ* in the same points as the equal angles at A. But by the angles at A the circle BED is projected into the line *bQ*. Therefore the angles at S are the measures of the parts of the projected circle *bQ*; and S is the dividing centre thereof.

COROLLARIES.

1. Any great circle *bQt* is projected into a line of tangents to the radius SQ.

2. If the circle *bC* pass through the centre of projection, then the projecting point A is the dividing centre thereof, and *Cb* is the tangent of its correspondent arch CB to CA the radius of projection.

PROPOSITION VI. THEOREM VI.

Let the parallel circle GLH (fig. 44.) be as far from the pole of projection C as the circle FNI is from its pole; and let the distance of the poles C, P be bisected by the radius AO; and draw *bAD* perpendicular to AO; then any straight line *bQt* drawn through *b* will cut off the arches *bl*, *Fn* equal to each other in the representations of these equal circles in the plane of projection.

Let the projections of the less circles be described. Then, because BD is perpendicular to AO, the arches

BO, DO are equal; but since the less circles are equally distant each from its respective pole, therefore the arches FO, OH are equal; and hence the arch BF is equal to the arch DH. For the same reason the arches BN, DL are equal; and the angle FBN is equal to the angle LDH; therefore, on the sphere, the arches FN, HL are equal. And since the great circle BNLD is projected into the straight line *bQnl*, &c. therefore *n* is the projection of F, and *l* that of L; hence *fn*, *bl*, the projections of FN, HL respectively, are equal.

PROPOSITION VII. THEOREM VII.

If *Fnk*, *blg* (fig. 45.) be the projections of two equal circles, whereof one is as far from its pole P as the other from its pole C, which is the centre of projection; and if the distance of the projected poles C, *p*, be divided in *o*, so that the degrees in C*o*, *op* be equal, and the perpendicular *os* be erected to the line of measures *gb*. Then the line *pn*, *Cl* drawn from the poles C, *p*, through any point Q in the line *os*, will cut off the arches *Fn*, *bl* equal to each other, and to the angle QC*p*.

The great circle AO perpendicular to the plane of the primitive is projected into the straight line *os* perpendicular to *gb*, by Prop. i. Cor. 3. Let Q be the projection of *q*; and since *pQ*, *CQ* are straight lines, they are therefore the representations of the arches *Pq*, *Cq* of great circles. Now since *PqC* is an isosceles spherical triangle, the angles PCQ, CPQ are therefore equal; and hence the arches *Pq*, *Cq* produced will cut off equal arches from the given circles FI, GH, whose representations *Fn*, *bl* are therefore equal: and since the angle QC*p* is the measure of the arch *bl*, it is also the measure of its equal *Fn*.

COROLLARY.

Hence, if from the projected pole of any circle a perpendicular be erected to the line of measures, it will cut off a quadrant from the representation of that circle.

PROPOSITION VIII. THEOREM VIII.

Let *Fnk* (fig. 45.) be the projection of any circle FI, and *p* the projection of its pole P. If *Cg* be the cotangent of CAP, and *gB* perpendicular to the line of measures *gc*, let CAP be bisected by AO, and the line *oB* drawn to any point B, and also *pB* cutting *Fnk* in *d*; then the angle *goB* is the measures of the arch *Fd*.

The arch PG is a quadrant, and the angle *goA* = *gPA* + *oAP* = *gAC* + *oAP* = *gAC* + *CAo* = *gAo*; therefore *gA* = *go*; consequently *o* is the dividing centre of *gB*, the representation of GA; and hence, by Prop. v. the angle *goB* is the measure of *gB*. But since *pg* represents a quadrant, therefore *p* is the pole of *gB*; and hence the great circle *pdB* passing through the pole of the circles *gB* and *Fn* will cut off equal arches in both, that is, *Fd* = *gB* = angle *goB*.

COROLLARY.

The angle *goB* is the measure of the angle *gpB*.
+ D 2 For

Gnomonic Projection of the Sphere. Plate ccccxiii.

For the triangle gpb represents a triangle on the sphere, wherein the arch which gB represents is equal to the angle which the angle p represents; because gp is a quadrant; therefore gob is the measure of both.

PROPOSITION IX. PROBLEM I.

To draw a great circle through a given point, and whose distance from the pole of projection is equal to a given quantity.

Let ADB (fig. 46.) be the projection, C its pole or centre, and P the point through which a great circle is to be drawn: through the points P, C draw the straight line PCA , and draw CE perpendicular to it: make the angle CAE equal to the given distance of the circle from the pole of projection C ; and from the centre C , with the radius CE , describe the circle EFG : through P draw the straight line PIK , touching the circle EFG in I , and it will be the projection of the great circle required.

PROPOSITION X. PROBLEM II.

To draw a great circle perpendicular to a great circle which passes through the pole of projection, and at a given distance from that pole.

Let ADB (fig. 46.) be the primitive, and CI the given circle: draw CL perpendicular to CI , and make the angle CLI equal to the given distance: then the straight line KP , drawn through I parallel to CL , will be the required projection.

PROPOSITION XI. PROBLEM III.

At a given point in a projected great circle, to draw another great circle to make a given angle with the former; and, conversely, to measure the angle contained between two great circles.

Let P (fig. 47.) be the given point in the given great circle PB , and C the centre of the primitive: through the points P, C draw the straight line PCG ; and draw the radius of the primitive CA perpendicular thereto; join PA ; to which draw AG perpendicular: through G draw BGD at right angles to GP , meeting PB in B ; bisect the angle CAP by the straight line AO ; join BO , and make the angle BOD equal to that given; then DP being joined, the angle BPD will be that required.

If the measure of the angle BPD be required, from the points B, D draw the lines BO, DO , and the angle BOD is the measure of BPD .

PROPOSITION XII. PROBLEM IV.

To describe the projection of a less circle parallel to the plane of projection, and at a given distance from its pole.

Let ADB (fig. 46.) be the primitive, and C its centre: set the distance of the circle from its pole, from B to H , and from H to D ; and draw the straight line AED , intersecting CE perpendicular to BC , in the point E : with the radius CE describe the circle EFG , and it is the projection required.

PROPOSITION XIII. PROBLEM V.

To draw a less circle perpendicular to the plane of projection.

Let C (fig. 48.) be the centre of projection, and TI a great circle parallel to the proposed less circle: at C make the angles ICN, TCO each equal to the distance of the less circle from its parallel great circle TI : let CL be the radius of projection, and from the extremity L draw LM perpendicular thereto; make CV equal to LM ; or CF equal to CM : then with the vertex V and asymptotes CN, CO describe the hyperbola WVK ; or, with the focus F and CV describe the hyperbola, and it will be the perpendicular circle described.

PROPOSITION XIV. PROBLEM VI.

To describe the projection of a less circle inclined to the plane of projection.

Draw the line of measures dp (fig. 49.) and at C , the centre of projection, draw CA perpendicular to dp , and equal to the radius of projection: with the centre A , and radius AC , describe the circle $DCFG$; and draw RAE parallel to dp : then take the greatest and least distances of the circle from the pole of projection, and set them from C to D and F respectively, for the circle DF ; and from A , the projecting point, draw the straight lines AFf , and ADd ; then df will be the transverse axis of the ellipse: but if D fall beyond the line RE , as at G , then from G draw the line $GADd$, and df is the transverse axis of an hyperbola: and if the point D fall in the line RE , as at E , then the line AE will not meet the line of measures, and the circle will be projected into a parabola whose vertex is f : bisect df in H , the centre, and for the ellipse take half the difference of the lines Ad, Af , which laid from H will give K the focus: for the hyperbola, half the sum of Ad, Af being laid from H , will give k its focus: then with the transverse axis df , and focus K , or k , describe the ellipse dMf , or hyperbola fM , which will be the projection of the inclined circle: for the parabola, make EQ equal to Ff , and draw fN perpendicular to AQ , and make fk equal to one half of nQ : then with the vertex f , and focus k , describe the parabola fM , for the projection of the given circle. FE .

PROPOSITION XV. PROBLEM VII.

To find the pole of a given projected circle.

Let DMF (fig. 50.) be the given projected circle, whose line of measures is DF , and C the centre of projection: from C draw the radius of projection CA , perpendicular to the line of measures, and A will be the projecting point: join AD, AF , and bisect the angle DAF by the straight line AP ; hence P is the pole. If the given projection be an hyperbola, the angle fAG (fig. 49.), bisected, will give its pole in the line of measures; and in a parabola, the angle fAE bisected will give its pole.

PROPOSITION XVI. PROBLEM VIII.

To measure any portion of a projected great circle, or to lay off any number of degrees thereon.

Let EP (fig. 51.) be the great circle, and IP a portion thereof to be measured: draw ICD perpendicular to IP ; let C be the centre, and CB the radius of projection, with which describe the circle EBD ; make IA

Plate ccccxiii.

+ See Conic Sections.

Gnomonic
Projection
of the
Sphere.

IA equal to IB; then A is the dividing centre of EP; hence AP being joined, the angle IAP is the measure of the arch IP.

Or, if IAP be made equal to any given angle, then IP is the correspondent arch of the projection.

PROPOSITION XVII. PROBLEM IX.

To measure any arch of a projected less circle, or to lay off any number of degrees on a given projected less circle.

Plate
ccccxxiii

Let $F n$ (fig. 52.) be the given less circle, and P its pole: from the centre of projection C draw CA perpendicular to the line of measures GH, and equal to the radius of projection; join AP, and bisect the angle CAP by the straight line AO, to which draw AD perpendicular: describe the circle G/H, as far distant from the pole of projection C as the given circle is from its pole P; and through any given point n , in the projected circle $F n$, draw $D n$, then $H I$ is the measure of the arch $F n$.

Or let the measure be laid from H to I, and the line D I joined will cut off $F n$ equal thereto.

PROPOSITION XVIII. PROBLEM X.

To describe the gnomonic projection of a spherical triangle, when three sides are given; and to find the measures of either of its angles.

Let ABC (fig. 53.) be a spherical triangle whose three sides are given: draw the radius CD (fig. 54.) perpendicular to the diameter of the primitive EF; and at the point D make the angles CDA, CDG, ADI, equal respectively to the sides AC, BC, AB, of the spherical triangle ABC (fig. 53.), the lines DA, DG intersecting the diameter EF, produced if necessary in the points A and G: make DI equal to DG; then from the centre C, with the radius CG, describe an arch; and from A, with the distance AI describe another arch, intersecting the former in B; join AB, CB, and ACB will be the projection of the spherical triangle (fig. 53.); and the rectilineal angle ACB is the measure of the spherical angle ACB (fig. 53.).

PROPOSITION XIX. PROBLEM XI.

The three angles of a spherical triangle being given, to project it, and to find the measures of the sides.

Let ABC (fig. 55.) be the spherical triangle of which the angles are given: construct another spherical triangle EFG, whose sides are the supplements of the given angles of the triangle ABC; and with the sides of this supplemental triangle describe the gnomonic projection, &c. as before.

It may be observed, that the supplemental triangle EFG has also a supplemental part $E F g$; and when the sides GE, GF, which are substituted in place of the angles A, B, are obtuse, their supplements $g E$, $g F$ are to be used in the gnomonic projection of the triangle.

PROPOSITION XX. PROBLEM XII.

Given two sides, and the included angle of a spherical triangle, to describe the gnomonic projection of that triangle, and to find the measures of the other parts.

Let the sides AC, CB, and the angle ACB (fig. 53.), be given: make the angles CDA, CDG (fig. 56.) equal respectively to the sides AC, CB (fig. 53.); also make the angle ACB (fig. 56.) equal to the spherical angle ACB (fig. 53.), and CB equal to CG, and ABC will be the projection of the spherical triangle.

To find the measure of the side AB: from C draw CL perpendicular to AB, and CM parallel thereto, meeting the circumference of the primitive in M; make LN equal to LM; join AN, BN, and the angle ANB will be the measure of the side AB.

To find the measure of either of the spherical angles, as BAC: from D draw DK perpendicular to AD, and make KH equal to KD: from K draw KI perpendicular to CK, and let AB produced meet KI in I, and join HI: then the rectilineal angle KHI is the measure of the spherical angle BAC. By proceeding in a similar manner, the measure of the other angle will be found.

PROPOSITION XXI. PROBLEM XIII.

Two angles and the intermediate side given, to describe the gnomonic projection of the triangle; and to find the measures of the remaining parts.

Let the angles CAB, ACB, and the side AC of the spherical triangle ABC (fig. 53.), be given: make the angle CDA (fig. 56.) equal to the measure of the given side AC (fig. 53.); and the angle ACB (fig. 56.) equal to the angle ACB (fig. 53.); produce AC to H, draw DK perpendicular to AD, and make KH equal to KD; draw KI perpendicular to CK, and make the angle KHI equal to the spherical angle CAB: from I, the intersection of KI, HI, to A draw IA, and let it intersect CB in B, and ACB will be the gnomonic projection of the spherical triangle ACB (fig. 53.). The unknown parts of this triangle may be measured by last problem.

PROPOSITION XXII. PROBLEM XIV.

Two sides of a spherical triangle, and an angle opposite to one of them given, to describe the projection of the triangle; and to find the measure of the remaining parts.

Let the sides AC, CB, and the angle BAC of the spherical triangle ABC (fig. 53.) be given: make the angles CDA, CDG (fig. 56.) equal respectively to the measures of the given sides AC, BC: draw DK perpendicular to AD, make KH equal to DK, and the angle KHI equal to the given spherical angle BAC; draw the perpendicular KI, meeting HI in I; join AI; and from the centre C, with the distance CG, describe the arch GB, meeting AI in B, join CB, and ABC will be the rectilineal projection of the spherical triangle ABC (fig. 53.) and the measures of the unknown parts of the triangle may be found as before.

PROPOSITION XXIII. PROBLEM XV.

Given two angles, and a side opposite to one of them, to describe the gnomonic projection of the triangle, and to find the measures of the other parts.

Let the angles A, B, and the side BC of the triangle

Gnomonic
Projection
of the
Sphere.

Gnomonic
Projection
of the
Sphere.

Plate
CCCLXXII.

angle ABC (fig. 55.), be given : let the supplemental triangle EFE be formed, in which the angles E, F, G, are the supplements of the sides BC, CA, AB respectively, and the sides EF, FG, GE, the supplements of the angles C, A, B. Now, at the centre C (fig. 56.) make the angles CDA, CDK equal to the measures of the sides GE, GF respectively, being the supplements of the angles B and A; and let the lines DA, DK intersect the diameter of the primitive EF, in the points A and K: draw DG perpendicular to AD, make GH equal to DG, and at the point H make the angle GHI equal to the angle E, or to its supplement; and let EI, perpendicular to CH, meet HI in I, and join AI: then from the centre C, with the distance CG, describe an arch intersecting AI in B; join CB, and ABC will be the gnomonic projection of the given triangle ABC (fig. 55.): the supplement of the angle ACB (fig. 56.) is the measure of the side AB (fig. 55.); the measures of the other parts are found as before.

It has already been observed, that this method of projection has, for the most part, been applied to dialling only. However, from the preceding propositions, it appears that all the common problems of the sphere may be more easily resolved by this than by either of the preceding methods of projection; and the facility with which these problems are resolved by this method has given it the preference in dialling. It may not perhaps be amiss, in this place, to give a brief illustration of it in this particular branch of science.

In an horizontal dial, the centre of projection Z (fig. 57.) represents the zenith of the place for which the dial is to be constructed; ZA the perpendicular height of the style: the angle ZPA, equal to the given latitude, determines the distance ZP of the zenith from the pole; and AP the edge of the style, which by its shadow gives the hour: the angle ZAP, equal also to the latitude, gives the distance of the equator EQ from the zenith: let Ea be equal to EA, and a will be the dividing point of the equator. Hence if the angles Ea I, Ea II, &c. Ea XI, Ea X, &c. be made equal to 15°, 30°, &c. the equator will be divided into hours; and lines drawn from P to these points of division will be hour lines.

If the dial is either vertical, or inclined to the horizon, then the point Z will be the zenith of that place whose horizon is parallel to the plane of the dial: ZE

will be the latitude of that place; and the hours on the former dial will now be changed into others, by a quantity equal to the difference of longitude between the given place and that for which the dial is to be constructed. Thus if it is noon when the shadow of the style falls on the line PX, then the difference of meridians is the angle Ea X, or 30°. Hence, when a dial is to be constructed upon a given plane, either perpendicular or inclined to the horizon, the declination and inclination of that plane must be previously found.

In an erect direct south dial, its zenith Z is the south point of the horizon, ZP is the distance of this point from the pole, and ZE its distance from the equator. If the dial is directed to the north, Z, represents the north point of the horizon; PZ the distance of Z from the pole under the horizon; and ZE the elevation of the equator above the horizon.

If the dial is an erect east or west dial, the zenith Z is the east or west points of the horizon accordingly, and the pole P is at an infinite distance, for the angle ZAP is a right angle; and therefore the line AP will not meet the meridian PZ. The line ZA produced is the equator, and is divided into hours by lines perpendicular to it.

If the plane of the dial is parallel to the equator, its zenith Z coincides with one of the poles of the equator P; and hence the hour lines of this dial are formed by drawing lines from the point Z, containing angles equal to 15°.

In the preceding method, of projection of the spheres equal portions of a great circle on the sphere are represented by unequal portions in the plane of projection, and this inequality increases with the distance from the centre of projection. Hence, in projections of the earth, those places towards the circumference of the projection are very much distorted. In order to avoid this inconveniency, M. de la Hire * proposed, that the eye should be placed in the axis produced, at the distance of the sine of 45° beyond the pole: In this case arches of the sphere and their projections are very nearly proportional to each other. Hence in a map of the earth agreeable to this construction, the axis, instead of being divided into a line of semitangents, is divided equally, in like manner as the circumference. The map of the world, Plate CCXIV. is constructed agreeable to this method of projection.

P R O

Projection. PROJECTION, in perspective denotes the appearance, or representation of an object on the perspective plane.

The projection, *e. gr.* of a point, as B (Fig. 1. Plate CCCLXXXIII.) is a point *b*, through which the optic ray BE passes from the objective point through the plane to the eye; or it is the point wherein the plane cuts the optic ray.

And hence it is easily conceived what is meant by the projection of a line, a plane or a solid.

PROJECTION in Alchemy, the casting of a certain imaginary powder, called *powder of projection*, into a crucible, or other vessel, full of some prepared metal, or

P R O

other matter; which is to be hereby presently transformed into gold.

Powder of PROJECTION, or of the philosopher's stone, is a powder supposed to have the virtue of changing any quantity of an imperfect metal, as copper or lead in a more perfect one, as silver or gold, by the admixture of a little quantity thereof.

The mark to which alchemists direct all their endeavours, is to find the powder of projection; which every one of them has been within an ace of a hundred times. See *PHILOSOPHER'S Stone*.

PROJECTURE, in architecture, the outjetting and prominency, or embossing, which the mouldings and

Projection,
Proje&uor.

Prolapsus
||
Prolap. sic.

and other members have beyond the naked wall, column, &c.

PROLAPSUS, in surgery, a prolapsion or falling out of any part of the body from its natural situation: thus we say, *prolapsus intestini*, "a prolapsion of the intestine," &c. See **SURGERY**.

PROLATE, in geometry, an epithet applied to a spheroid produced by the revolution of a semi-ellipsoid about its larger diameter. See **SPHEROID**.

PROLEGOMENA, in philology, certain preparatory observations or discourses prefixed to a book, &c. containing something necessary for the reader to be apprised of, to enable him the better to understand the book, or to enter deeper into the science, &c.

PROLEPSIS, a figure in rhetoric, by which we anticipate or prevent what might be objected by the adversary. See **ORATORY**, n° 80.

PROLEPTIC, an epithet applied to a periodical disease which anticipates, or whose paroxysm returns sooner and sooner every time; as is frequently the case in agues.

PROLIFER FLOS; (*proles*, "an offspring;" and *fero*, "to bear"); a prolific flower, or a flower which from its own substance produces another; a singular degree of luxuriance, to which full flowers are chiefly incident. See **BOTANY**, p. 428.

PROLIFIC, something that has the qualities necessary for generating.

The prolific powers of some individuals among mankind are very extraordinary.—Instances have been found where children, to the number of six, seven, eight, nine, and sometimes sixteen, have been brought forth after one pregnancy. The wife of Emmanuel Gago, a labourer near Valladolid, was delivered, the 14th of June 1779, of five girls, the two first of whom were baptized: the other three were born in an hour after; two of them were baptized; but the last, when it came into the world, had every appearance of death. The celebrated Tarfin was brought to bed in the seventh month of her pregnancy, at Argenteuil near Paris, 17th July 1779, of three boys, each 14 inches and a half long, and of a girl 13 inches: they were all four baptised, but did not live 24 hours.

The public papers for the month of June 1779 made mention of one Maria Ruiz, of the district of Lucena in Andalusia, who was successively delivered of 16 boys, without any girls; and seven of them were still alive on the 17th of August thereafter. The following, though a recent fact, is almost incredible: In the year 1755, a Muscovite peasant, named *James Kyrloff*, and his wife, were presented to the Empress of Russia. This peasant had been twice married, and was then 70 years of age. His first wife was brought to bed 21 times; namely, four times of four children each time; seven times of three, and ten times of two; making in all 57 children, who were then alive. His second wife, who accompanied him, had already been delivered seven times, once of three children, and six times of twins, which made 15 children for her share. Thus the Muscovite patriarch had already had 72 children by two marriages. We are assured that the sultan Mustapha III. had issue by his concubines 580 male children. What number of female children he had, and whether there were twins of both sexes, we are not informed. These facts suppose great fecundity;

and whatever credit is given to them, we must consider as entirely fabulous what is reported concerning a countess of Holland who was delivered of 365 children, of a very small size.

PROLIXITY, in discourse, the fault of entering into too minute a detail, or being too long, precise, and circumstantial, even to a degree of tediousness.

PROLOCUTOR of the convocation, the speaker or chairman of that assembly. See **CONVOCATION**.

PROLOGUE, in dramatic poetry, a discourse addressed to the audience before the drama or play begins. The original intention was to advertise the audience of the subject of the piece, and to prepare them to enter more easily into the action, and sometimes to make an apology for the poet.

PROMETHEUS, the son of Japetus, supposed to have been the first discoverer of the art of striking fire by flint and steel; which gave rise to the fable of his stealing fire from heaven: A renowned warrior; but whose history is involved in fable. He flourished about 1687 B. C. The poetical account is, that he formed a man of clay of such exquisite workmanship, that Pallas, charmed with his ingenuity, offered him whatever in heaven could contribute to finish his design; and for this purpose took him up with her to the celestial mansions, where he stole some fire from the chariot of the sun, which he used to animate his image. At this theft Jupiter was so enraged, that he ordered Vulcan to chain him down on Mount Caucasus, and sent an eagle or vulture to prey on his liver; which every night was renewed, in proportion to the quantity eaten up in the daytime, until at last he was delivered by Hercules, who killed the vulture.

PROMETHEUS, in ancient astronomy, was the name of a constellation of the northern hemisphere, now called *Hercules*, *Ensignum*. See **ASTRONOMY**, n° 406.

PROMISE, in ordinary cases, is a declaration of some intention to be put in execution; but in morals is a solemn asseveration by which one pledges his veracity that he shall perform, or cause to be performed, the thing which he mentions.

As such a declaration excites expectations in the minds of those to whom it is made; and as to frustrate these expectations might rouse indignation, and be followed by consequences injurious to the person, the character, or interest, of him who made it—it becomes a matter of prudence in the promiser to keep his word. And farther, as a certain degree of confidence is found necessary to the very existence of civil society, and as others may have acted on the faith of his promise, it is now not a matter of prudence only to keep his word—it is a duty which he owes to all who have spent their time, their money, or their labour, in consequence of those expectations which he has warranted them to entertain.

It, then, being consonant to sound reason, necessary to the existence of civil society, and in general the interest of both the promiser and promisee, that the words of the promise should be fulfilled, it has become a maxim in morals that a man is obliged to perform his promise.

In many instances, the great difficulty concerning a promise is, how to explain it; for although the grounds of its obligation be those expectations which it has raised, a question will occur, Is the promiser bound to answer

Prolixity
||
Promise.

1
Promise defined.

2
How it comes to be binding.

3
Interpretation of a promise sometimes difficult.

Promisc. answer fully all the expectations to which the different constructions of his words may have given birth? Should I, for instance, desire a man to run with a letter to such a place, and engage to satisfy him upon his return; and if on his return I gave him double of the usual hire in like cases; but if he be not satisfied with less than the triple of such a sum, am I obliged to grant his demands? This will lead us to consider the rules by which a promise should be interpreted.

⁴ Whether the meaning of the promiser or promisee ought to be taken. If a promise were always to be deemed obligatory in the sense in which the promisee receives it, a man would not know what he had promised; the promisee, from a difference of views, associations, and interests, might conceive a sense of which the promiser had never dreamed; might suppose engagements which were never intended, which could not be foreseen, and, although foreseen, could not be performed. For these reasons it is natural to think that the sense of the promiser should rather direct the interpretation. He knows precisely what it is he has undertaken, and is unquestionably the best judge of what meaning he affixed to his words. His explanation should therefore be admitted, if information alone could give him a title to decide in the affair.

But something more than mere information, or a knowledge of the cause, is expected from a judge, as integrity is equally essential to his character. Doubts may arise when the words will admit of various meanings, whether the promiser will be so candid as impartially to own the precise meaning which he had actually annexed to his expressions: At any rate, if he wished to deceive, he might purposely use an ambiguous phraseology, and perform the promise in a sense of his own without satisfying the reasonable hopes of the promisee.

When the daughter of Tarpeius bargained with Tatius to betray the citadel for what he and his Sabines wore on their left hands, meaning their rings and their golden bracelets, Tatius probably performed his promise in the way which he intended, when he caused her to be buried under their shields, which they carried also on their left hands. But who will say that here was not treachery and a dishonourable abuse of that confidence which had been reposed in him?

⁵ In doubtful cases the interpretation on of neither is to be trusted. It must therefore be obvious, that the import of a promise, where its meaning is disputed, is not to be determined by the sense of the promiser nor by the expectations of the promisee; and if it was said that the obligation of a promise arose from those expectations which had been raised by it, the assertion now must be limited to those expectations which were intentionally raised by the promiser, or those which to his knowledge the promisee was induced to entertain in consequence of that declaration which had been made to him. Should there still be a doubt about what expectations were intentionally raised, and what should have been reasonably entertained, recourse must be had to the judgment of those who are allowed to be persons of candour, and who are acquainted with the characters of the men, and with those circumstances in which the promise was made.

⁶ Cases where a promise is not binding. The following are some of the cases in which a promise is not binding. As the obligation to perform the promise arises from those expectations which are intentionally raised by the promiser; it is plain that no promise can be binding before acceptance, before the promise has been communicated to the promisee, and be-

fore, he has entertained hopes of its performance. The case is similar where a promise is released, that is, where the performance is dispensed with by the promisee, and where he entertains no expectations on account of any thing that the promiser has said to him. Should a third person entertain hopes on account of the promise, he is to cherish these hopes at his own hazard, having no encouragement from the promiser to do so: yet if this person has been warranted to hope by the promisee, the promisee has renounced his privilege of releasing the promise, and along with the promiser becomes bound for its performance.

⁷ When it is released by the promisee. A promise is not binding where the performance is unlawful; and the performance is unlawful where it is contrary to former promises, or to any moral and religious precept, which from the beginning to the end of time is of perpetual and unalterable obligation. Thus no man is bound by his promise to give to me what he has already promised to another; and no man is bound by his promise to blaspheme God, to commit murder, or to criminate the innocent. Such promises are unlawfully made, and cannot be otherwise than unlawfully performed.

⁸ Where its performance is unlawful. Some have even carried their scruples so far as to doubt, whether any promise, unlawfully made, can be lawfully performed. Should a man, during the lifetime of his wife, happen to promise marriage to another, such a man (they say) by the Christian religion has already committed adultery in his heart; and should he afterwards become a widower, he is not bound, and he even ought not, to fulfil his engagements, as this would be putting his criminal intention into execution. This species of reasoning, we must confess, is to us unintelligible. —As the wife is dead, what now should prevent the man from marrying the object of his affections? Why, say the casuists, he already is under a promise to marry her, and his promise was made at a time when it should not have been made. It is true, the performance, considered by itself, is opposed by no law human or divine; but then it originated in what was wrong; and however much the Supreme Being and the bulk of the creation may be out of the secret, we have discovered by the ingenious logic of casuistry, that evil can never spring out of good, nor good out of evil; but that the means and the end, the motive and the action are always of the same complexion in morals.

⁹ A case where doubts have arisen. When a promise is made, the particular circumstances in which it is to be deemed obligatory are sometimes mentioned. "I promise (for instance) to lend my friend 200 pounds within three days, provided a certain creditor which I name do not make a demand on me before that time." In other cases no circumstance is foreseen by the promiser to prevent the fulfilling of his engagement; and hence we have erroneous promises, which proceed on the supposition that things are true, possible, and lawful, which are not so. An erroneous promise, which proceeds on the false representation of the promisee, is not binding.

¹⁰ Erroneous promises. A London gentleman lately purchased an estate in the south of England at a public sale, believing the description which he saw in the newspapers, and which likewise was given by the auctioneer, to be true; but finding afterwards that the estate nowise corresponded to the description, the law freed him from his engagement, because the seller had evidently been guilty of a breach

Promise. a breach of promise in not satisfying those expectations, which he had intentionally and even studiously excited in the buyers.

11
A promise not binding when the performance is impossible. An erroneous promise, whose performance is impossible, is not binding. Before the conclusion of the late war a planter of Tobago promised to send to his friend in England 12 hogheads of sugar from the next year's produce of his estate; but before that time Tobago fell into the hands of the French, and the West Indian found it impossible to answer the expectations of his friend in England.

12
Nor when it is unlawful. An erroneous promise, whose performance is unlawful, or, to speak more precisely, whose performance is contrary to a prior promise, or to any moral or religious obligation, is not binding. A father believing the accounts from abroad of his son's death, soon after bequeathes his fortune to his nephew; but the son, the report of whose death had been false, returns home, and the father is released from the promise to his nephew, because it was contrary to a prior promise, which he had tacitly come under to his son. This prior promise was implied in the whole of the father's conduct, and was expressed in signs as emphatic and as unequivocal as those of language. It had all the effect too of the most solemn promise on the son, who, to his father's knowledge, was induced in consequence of this promise to entertain the most sanguine hopes of succeeding to his father, if he survived. The world likewise could bear testimony that these expectations were not rashly cherished. He was brought into existence by means of his father, who was thereby understood to love him affectionately; he was ushered into society as the representative of his family, and was therefore supposed to be the heir of its wealth. Religion itself supported his pretensions, pronouncing the father worse than an infidel who neglects to show that attention to his children which the world naturally expects from a parent.—That the father's promise was not released from the mere circumstance that the mistake was known to his nephew the promisee, will appear plain from the following circumstance. Suppose the father a landed proprietor, that the lease of one of his farms has expired, and that he has long been expecting to let it at L. 200; suppose that this sum is refused, and that he agrees with the present tenant to grant a new lease at L. 150—the obligation here to perform his promise is not dissolved by an after offer of L. 200, though the tenant knew that L. 200 had been expected, and that only from despairing of that sum his landlord had granted the new lease at L. 150: the promise is binding, because the performance is every way lawful, contrary to no prior engagement, and opposed to no principle in morals. The law of the land, were the proprietor reluctant, would enforce the obligation, and exact obedience in the tone of authority; because breaches of faith, were they permitted in such cases, would destroy all confidence, and annihilate the bonds of social union:

Men live and prosper but in mutual trust;
A confidence of one another's truth. *Oraonoko.*

13
Utility no criterion whereby to judge of the validity of promises. The great difficulty which many have to encounter in determining when erroneous promises ought or ought not to be kept, arises from their proceeding on a principle of whose consequences they do not seem to be al-

VOL. XV.

ways aware. There is seldom, they perceive, a virtuous action that is not attended with some happy effects; and it will, perhaps, be generally allowed, that the comparative merit of similar virtues may safely be estimated by their utility: But to make utility, as some do, the criterion of virtue, and pronounce an action vicious or virtuous merely on account of those consequences which they see may flow from it, is a dangerous maxim. Evil has often sprung out of good, and good out of evil; and good and evil have frequently sprung from the same action. In Mandeville's *Hive*,

That root of evil Avarice,
That damn'd ill-natur'd baneful vice,
Was slave to Prodigality,
That noble sin; whilst Luxury
Employ'd a million of the poor,
And odious Pride a million more.
Envy itself and Vanity
Were ministers of Industry:
That darling folly, Fickleness,
In diet, furniture, and dress,
That strange ridiculous vice, was made
The very wheel that turn'd the trade.

Promise.

14
This principle would give a sanction to vice and falsehood.

The description here is not altogether false; and these indeed may be some of the consequences that flow from avarice, luxury, pride, vanity, and envy: but these are not all.—To see at once all the consequences that spring from an action, the good and the bad, the particular and general, the immediate and remote, would require sometimes the foresight of Omniscience, and at all times a knowledge superior to what is human. In the Fable, of the Bees, the author's object was to show that private vices are public benefits; and he therefore was naturally led by his argument to consider only such consequences of vice as favoured his hypothesis. He wanted candour. And that artifice which runs through his Fable happens to remind us, that while the remote and the general effects of an action may not be seen, the particular and immediate, which fall within our notice, are apt to be viewed through the medium of passion, interest, or opinion. For these reasons, it appears surprising how any person should ever imagine that the obligation to perform a promise should depend entirely upon the ideas which the promiser apprehended of its utility.

The best refutation of such an opinion are the singular conclusions to which it leads.

A late writer on political justice, who appears to have embraced it, gets into reasoning not very common. In a part of his system he looks on morals as an article of trade: virtue and vice, in his Chapter of *Promises*, are but antiquated terms for profit and loss; and right and wrong are used to express what is beneficial and what is hurtful, in his apprehension, to himself and the community.—With respect to veracity, those “rational and intelligent beings,” by whom he wishes the affairs of the world to be carried on, may, while they act as rational and intelligent, break or perform their promises at pleasure. He thinks it “essential to various circumstances of human intercourse, that we should be known to bestow a steady attention upon the quantities of convenience or inconvenience, of good or evil, that might arise to others from our conduct.” After this attention, the disappointment of the promisee is not to be

15.
The consequences that flow from it ridiculous and absurd.

Promise. minded, though the expectations excited by these "rational and intelligent beings" may have "altered the nature of his situation, and engaged him in undertakings from which he would otherwise have abstained." What the promiser takes to be the general utility and the fitness of things is to be his guide. And a breach of promise will be attended with the following advantages: "The promisee, and all other men, will be taught to depend more upon their own exertions, and less upon the assistance of others, which caprice may refuse or justice withhold. He and all others will be taught to acquire such merit, and to engage in such pursuits, as shall oblige any honest man to come to their succour if they should stand in need of assistance." This breach of promise, with a view to the general utility, will, so far from being criminal, form a part of that resolute execution of justice which would in a thousand ways increase the independence, the energies, and the virtue of mankind*."

* Godwin's Inquiry concerning Political Justice, book 3. ch. 3.

16
A private individual has no right to intrude his schemes of utility on the public.

* See Note b. iii. ch. 6.

* The fairs are Godwin's rational and intelligent beings.

Such are the views which determined this author to consider "the validity of promises" as "inconsistent with justice," and as "foreign to general good." From one, however, who relies with so much confidence on the promiser, it would be certainly desirable to know, whether the person, who violates his faith for the public utility, is always to be candid. Where breach of faith promotes his own interest, ought he alone to decide on the validity of his promise? or where promises are broken for the general good, is he to be guided by his own visionary schemes of utility? Is he to act as trustee for the public without any delegated power? and shall the community submit to his decisions without so much as putting the question, Who hath made thee a ruler over us? When a writer thus deviates so far from the path of reason, it is natural to ask, what was the *ignus fatuus* that misled him? In the present case it is pretty obvious. Being something of opinion with the celebrated Turgot*, that romances are the only books in which moral principles are treated in an impartial manner, this gentleman, in his Chapter of *Promises*, seems to have borrowed a part of his morality from the doggerels of Butler; and having adopted though from different motives, the political principles of Sir Hudibras's squire, that obedience to civil government is not due because it is promised, he has come to exactly the same conclusion with respect to the obligation of keeping one's word. But Ralph has reasoned with more ingenuity; and has shown not only that the public good, but the glory of the Lord, may be sometimes promoted by a breach of faith.

The fairs, * whom oaths and vows oblige,
Know little of their privilege;
Farther, I mean, than carrying on
Some self-advantage of their own:
For if the dev'l, to serve his turn,
Can tell truth, why the fairs should scorn,
When it serves theirs, to swear and lie,
I think there's little reason why:
Else h' has a greater pow'r than they,
Which 'twere impiety to say:
W' are not commanded to forbear,
Indefinitely, at all to swear;

But to swear idly, and in vain,
Without self-interest and gain;
For breaking of an oath and lying
Is but a kind of self-denying,
A faint-like virtue; and from hence
Some have broke oaths by Providence:
Some, to the glory of the Lord,
Perjur'd themselves and broke their word:—
For fairs may do the same thing by
The spirit, in sincerity.
Which other men are tempted to,
And at the devil's instance do.

HUDIBRAS, *Cant.* II.

Here are new views of utility; which, were they to be considered as of any weight, would increase the difficulty of determining when an erroneous promise ought to be kept.

But should views of utility be laid aside, and should it be made an invariable rule that truth is on no account to be violated, that deceit is never to be practised, and that moral obligations are not to be dissolved for the prospect of any physical advantage; those doubts which arise concerning the validity of erroneous promises will soon disappear. Disagreeable perhaps and ridiculous consequences may sometimes arise to a few individuals from an honest and conscientious adherence to their promise; but will any assert that the general good, *that burden of the song*, will ever be endangered by too much veracity?

So numerous inconveniences arise daily from the regular operation of those great physical laws, which are under the immediate direction of Providence, that those philosophers who have adopted the principle of utility, and are much surprised to see the universe so awkwardly planned for the ease and comfort of them and their species, have been under the necessity of imputing many events in nature to the malignity of some evil independent being; or of allowing that things have degenerated since they first came from the hands of the Creator, and that they must now be exceedingly altered from what they had been when He chose to pronounce them all very good. Thus, absurdity or impiety must always be the consequence of judging of the vice and virtue of an action by its utility, and of estimating its utility by our limited views and erroneous conceptions.

As for extorted promises, it is curious to observe how this question should always be started, whether or not they ought to be kept? and another question should seldom be thought of, whether or not they ought to be made? Fortitude was one of the cardinal virtues among the ancients; and is deemed of such importance in the Christian system, that the fearful are classed with the unbelievers, and are thought unworthy of the favour of Deity, as being incapable of supporting those trials to which heaven exposes the faithful as the truest test of Christian virtue.—If a person should want the necessary fortitude to be virtuous, it will be a poor excuse for his baseness, that he has added deceit to his cowardice: and surely it is not the business of morality, when it has found him guilty of one crime, to grant him a dispensation for committing two. The laws of jurisprudence, it will readily be allowed, cannot favour the claims of the promisee; because they ought never

to

Promise.

17
Views of utility an unsafe guide in morals.

18
Extorted promises.

19
Whether binding or not.

Promise. to lend their support to oppression and violence. But their acquittal, should he violate his faith, will by no means vindicate the character of the promiser. Their acquitting a woman from the charge of adultery, goes a short way in restoring the fair reputation of her innocence.

Let jurisprudence decide as it will, the man of honour and the generous patriot can never be brought to respect the person who, struck with a panic, could betray either himself or his friends. The magnanimous spirits who could die for the truth will view with contempt his pitiful deceit. Those unfortunate men who may suffer from that very distrust which the breach of his faith has begotten, will always detest him as a traitor and enemy; and heaven itself cannot be supposed to reward that soldier who deserts her cause, and relinquishes the post which she has assigned him, at the sight of danger.

If we once begin to accommodate morality to the dispositions and humours of mankind, it is hard to say where this species of complaisance will end. The degrees of timidity are so various, and some tempers by nature so yielding, that repeated importunity or an earnest request will extort a promise.

20
The laws
of morality
are not to
be accomo-
dated to the
humours
and inte-
rests of
mankind,

A young lady was frequently pressed by her dying husband to grant him a promise that she would not marry after his death. For some time she was able to resist with becoming spirit his absurd request; but upon his declaring oftener than once that he could not otherwise die in peace, she complied and promised. Too young, however, for this effort of continence, she afterwards listened to the addresses of a second lover, and found her heart insensibly engaged before she adverted to the impropriety of a new attachment. But proposals of marriage could scarcely fail to remind her of her promise and awaken her scruples. These she soon communicated to her lover, with her firm resolution to remain a widow, if the contrary measure, which she greatly preferred, and on which her earthly happiness depended, were not approved by some spiritual counsellor.

Upon this declaration it was agreed to take the advice of their own minister, who was an eminent dissenting clergyman in the diocese of Oxford: but this gentleman, unwilling to decide in a matter of such importance, proposed to refer it to Dr Secker, who was then bishop of that see. This prelate too declined to give any judgment in the case; but, as was his way, mustered up a number of arguments on each side of the question, and committed them to a letter, which a learned gentleman of our acquaintance had some time ago an opportunity of seeing in manuscript.

If the sentiments to which the bishop was inclined could have been inferred from his statement of arguments, he seemed to think that the promise was binding. In our opinion, he ought to have given a positive decision. It was no matter whether the promise was extorted or not: the promise was made; and the question was now, whether or not was the performance lawful? That it was lawful appears evident. The lady was under a moral obligation to remain a widow; and no moral obligation, so far as we know, required her to marry.

To be fruitful and multiply, indeed, is declared in Scripture, and is found, to the woful experience of many, to be one of the general laws of our nature. But of all those laws intended by nature to regulate the conduct of inferior intelligences, the moral, which were meant

to be checks and correctors of those abuses to which the physical are apt to be carried, are certainly the most sacred and obligatory. To procreate his species, a man is not then to be guilty of adultery, nor of fornication, nor to listen to the lewd calls of incontinency. St Paul's observation, that it is better to marry than burn, cannot be allowed in this instance to have much weight. He has not defined what degree of amorous inflammation constitutes burning, nor in what cases this burning would be a sufficient warrant for marrying. In the present instance he does not even consider marriage as a duty; he compares it with burning, and thinks it only the least of the two evils. Not that marriage is evil of itself; for he that marrieth doth well; but there are circumstances in which it would be inconvenient to marry, and in which he that marrieth not is said to do better. But if those inconveniences be reasons sufficient to deter from marrying, is that person to be held excusable who, in order to gratify an animal passion, somewhat refined, should violate an oath, and trample on a sacred moral obligation?

The young lady might indeed declare that her earthly happiness was at an end if she were not permitted to marry again: but what circumstance prevented her from marrying? It was not the opinion of her own pastor, nor the bishop of Oxford: the truth is, it was certain scruples of her own, which being unable of herself to overcome, she had piously solicited the assistance of others. It is certainly a misfortune that a devotional and amorous turn should always be so closely connected in the females. Both, however, cannot always be indulged. Who will say, that the motive is rational which inclines one to cherish a passion which conscience disapproves? The virtue of continency might indeed have borne hard on this lady's constitution, and in her way to immortal happiness might have formed a gate so strait and narrow as it might be difficult for her to pass through: but after all, her case was not harder than that of nuns, who take the vows of perpetual chastity, and endure sufferings of a similar nature, and in some instances even perhaps greater than hers; yet doing it cheerfully, from the supposition that the Omniscient is well acquainted with the nature of the great sacrifice which they make, and that after death he will study to requite them, and bestow on them something like an equivalent, which in their opinion can scarcely be less than a happiness in heaven as ample as their wishes and as lasting as their souls.

Every promise, therefore, which is not released, nor fraudently obtained by the promisee, is to be held binding if the performance be lawful and possible.

The Christian cannot, and a man of honour will scarcely venture to reject this maxim, that a good man ought not to change though he swear to his hurt. Yet a simple promise and a promissory oath are not very different in point of obligation. Most people know, and, where any moral duty is concerned, they ought particularly to reflect, that this world is governed by an Almighty Being, who knows all things, who lives always, and who is just to reward and to punish. The person who makes a promissory oath does it avowedly under an immediate sense of these truths; the person who makes a simple promise, though he certainly ought, yet may not reflect on these at the time. The former, when he violates his oath, exhibits, only to outward appearance,

Promise.
21
Moral law
superior to
physical in
point of
obligation.

22
A promise
of a similar
nature with
an oath.

PROMONTORY, or **PROMONTORY**, a greater contempt of the Divine power, knowledge, and justice, than he who violates a simple promise under an impression of the same truths. To Him who knows the secrets of the heart, the breach of the promise must appear as criminal as the breach of the oath. See **ASSUMPSIT** and **OATH**.

PROMONTORY, in geography, a high point of land or rock projecting out into the sea; the extremity of which towards the sea is called a *cape* or *headland*. See **PLATE CCXII**.

PROMPTER, in the drama, an officer posted behind the scenes, whose business it is to watch attentively the actors speaking on the stage, in order to suggest and put them forward when at a stand, to correct them when amiss, &c. in their parts.

PROMULGATED, or **PROMULGED**, something published or proclaimed, and generally applied to a law, to denote the publishing or proclaiming it to the people.

PROMAOS, in the ancient architecture, a porch to a church, palace, or other spacious building. See the article **PORCH**.

PRONATION, among anatomists. The radius of the arm has two kinds of motions, the one called *pronation*, the other *supination*. Pronation is that whereby the palm of the hand is turned downwards; and supination, the opposite motion thereto, is that whereby the back of the hand is turned downwards. The peculiar muscles whereby pronation is performed, are called *pronatores*, as those by which supination is performed are termed *supinatores*. See **ANATOMY**, *Table of the Muscles*, and *Plates*.

PRONG-HOE, in husbandry, a term used to express an instrument used to hoe or break the ground near and among the roots of plants.

The ordinary contrivance of the hoe is very defective, it being only made for scraping on the surface; but the great use of hoeing being to break and open the ground, beside the killing of the weeds, which the ancients, and many among us, have thought the only use of the hoe, this dull and blunt instrument is by no means calculated for the purposes it is to serve. The prong-hoe consists of two hooked points of six or seven inches long, and when struck into the ground will stir and remove it the same depth as the plough does, and thus answer both the ends of cutting up the weeds and opening the land. It is useful even in the horse-hoeing husbandry, because the hoe-plough can only come within three or four inches of the rows of the corn, turnips, and the like; whereas this instrument may be used afterwards, and with it the land may be raised and stirred even to the very stalk of the plant. See **AGRICULTURE** and **HOE**.

PRONOUN, **PRONOMEN**, in grammar, a declinable part of speech, which being put instead of a noun, points out some person or thing. See **GRAMMAR**.

PRONUNCIATION, in grammar, the manner of articulating or sounding the words of a language.

Pronunciation makes the most difficult part of written grammar; in regard that a book expressing itself to the eyes, in a matter that wholly concerns the ears, seems next akin to that of teaching the blind to distinguish colours: hence it is that there is no part so defective in grammar as that of pronunciation, as the writer has frequently no term whereby to give the read-

er an idea of the sound he would express; for want of a proper term, therefore, he substitutes a vicious and precarious one. To give a just idea of the pronunciation of a language, it seems necessary to fix as nearly as possible all the several sounds employed in the pronunciation of that language. Cicero tells us, that the pronunciation underwent several changes among the Romans: and indeed it is more precarious in the living languages, being, as Du Bos tells us, subservient to fashion in these. The French language is clogged with a difficulty in pronunciation from which most others are free; and it consists in this, that most of their words have two different pronunciations, the one in common prose, the other in verse.

As to the pronunciation of the English language, the ingenious Mr Martin, in his *Spelling-Book of Arts and Sciences*, lays down the following rules: 1. The final (*e*) lengthens the sound of the foregoing vowel; as in *can, cane; rob, robe; tun, tune, &c.* 2. The final (*e*), in words ending in *re*, is sounded before the *r* like *u*; as *massacre, massa-cur; lucre, lu-cur, &c.* 3. The Latin diphthongs *a, æ*, are sounded like *e*; as *Ætna, Etna; æconomy, economy, &c.*: but at the end of the words *oe*, sounds like *o*; as in *toe, foe, &c.* 4. Also the English improper diphthongs, *ea, eo, eu, ue*, found only the *e* and *u*; as *tea or te; seoffee or seffe; due or du; true or tru, &c.* though sometimes *eo* and *ea* are pronounced like *ee*, as in *people, fear, near, &c.* 5. Sometimes the diphthong (*ie*) is pronounced like *e* in *cieling*, like *ee* in *field*, and, at the end of words, always like *y*, as in *lie, &c.*; and *ei* is pronounced either like *e* or *ai*, as in *deceit, reign, &c.* 6. The triphthong *eau* is pronounced like *o*, in *beau* and *jet d'eau*; and *ieu* sounds like *u* in *lieu, adieu, &c.* 7. The sound of *c* is hard before the vowels *a, o, u*, as in *call, cold, cup, &c.*; also sometimes before *b*, as in *chart, cold, &c.*; and before *l* and *r*, as in *clear, creep, &c.* It is otherwise generally soft, as in *city, cell, cyder, child, &c.* 8. In French words *ch* is sounded like *sh*, as in *chagreen, machine*; and sometimes like *qu*, as in *choir*. 9. the sound of *g* is hard before *a, o, u, l, r*, as in *gall, go, gum, glean, grope*; also before *ui*, as in *guilt, guild, &c.*; and before *h*, as in *ghyl*; sometimes before *i*, as in *gibbous, gibberish*. It is also generally hard before *e*, as in *get, geld, &c.*; but soft in many words derived from the Greek and Latin, as in *geometry, genealogy, genus, &c.* Two *gg* are always hard, as in *dagger, &c.* The sound of *g*, when soft, is like that of *j*. 10. In any part of a word, *ph* sounds like *f*, as in *philosophy, &c.* 11. The sound of *qu*, at the end of French words, is like *k*, as in *risque, &c.* 12. The syllables *ti* and *ci*, if followed by a vowel, sound like *fi* or *shi*; as in *fiction, logician, &c.* 13. When *cc* occurs before *i*, the first is hard and the latter is soft; as in *flaccid, &c.* 14. The letter *p* is not pronounced at the beginning of syllables before *f* and *t*; as in *psalm, ptarmic, &c.* As to other peculiarities regarding the pronunciation of single letters, many of them have been taken notice of at the beginning of each, in the course of this work.

But it is not enough to know the just pronunciation of single letters, but also of words: in order to which, the accenting of words ought to be well understood; since nothing is more harsh and disagreeable to the ear, than to hear a person speak or read with wrong accents. And indeed in English the same word is often both

Pronuncia-
tion,
Proof.

Proof.

both a noun and a verb, distinguished only by the accent, which is on the first syllable of the noun, and on the last of the verb; as *fèrment* and *fermènt*; *rècord* and *recòrd*, &c. We are to observe also, that in order to a just expression of words, some require only a single accent on the syllable, as in *fòrment*, &c.; but in others it should be marked double, as in *ani'mal*, because it is pronounced as if the letter was wrote double, viz. *animal*.

Mr Sheridan's Dictionary will be found extremely useful as a directory in acquiring the pronunciation of the English language; but care must be taken to avoid his provincial brogue, which has certainly misled him in several instances. Mr Walker's Pronouncing Dictionary, lately published, will likewise deserve the student's attention. It is a work of great labour and merit, and is highly useful. It has indeed some faults and inaccuracies, but it is notwithstanding, in all probability, the best of the kind.

PRONUNCIATION is also used for the fifth and last part of the rhetoric, which consists in varying and regulating the voice agreeably to the matter and words, so as most effectually to persuade and touch the hearers. See ORATORY, Part IV.

PROOF, in law and logic, is that degree of evidence which carries conviction to the mind. It differs from demonstration, which is applicable only to those truths of which the contrary is inconceivable. It differs likewise from probability, which produces for the most part nothing more than opinion, while proof produces belief. See PROBABILITY.

The *proof* of crimes was anciently effected among our ancestors divers ways; viz. by duel or combat, fire, water, &c. See DUEL and ORDEAL.

Proof of Artillery and small Arms, is a trial whether they stand the quantity of powder allotted for that purpose. The rule of the board of ordnance is, that all guns, under 24-pounders, be loaded with powder as much as their shot weighs; that is, a brass 24-pounder with 21 lb. a brass 32-pounder with 26 lb. 12 oz. and a 42-pounder with 31 lb. 8 oz.; the iron 24-pounder with 18 lb. the 32-pounder with 21 lb. 8 oz. and the 42-pounder with 25 lb.

The brass light field-pieces are proved with powder that weighs half as much as their shot, except the 24-pounder, which is loaded with 10 lb only.

Government allows 11 bullets of lead in the pound for the proof of muskets, and 14.5, or 29 in two pounds, for service; 17 in the pound for the proof of carabines, and 20 for service; 28 in the pound for the proof of pistols, and 34 for service.

When guns of a new metal, or of lighter construction, are proved; then, besides the common proof, they are fired 200 or 300 times, as quick as they can be, loaded with the common charge given in actual service. Our light 6-pounders were fired 300 times in 3 hours 27 minutes, loaded with 1 lb. 4 oz. without receiving any damage.

Proof of Powder, is in order to try its goodness and strength. See GUNPOWDER.

Proof of Cannon, is made to ascertain their being well cast, their having no cavities in their metal, and, in a word, their being fit to resist the effort of their charge of powder. In making this proof, the piece is laid upon the ground, supported only by a piece of

wood in the middle, of about 5 or 6 inches thick, to raise the muzzle a little; and then the piece is fired against a solid butt of earth.

Tools used in the Proof of Cannon are as follow:

Searcher, an iron socket with branches, from 4 to 8 in number, bending outwards a little, with small points at their ends: to this socket is fixed a wooden handle, from 8 to 12 feet long, and 1½ inch in diameter. This searcher is introduced into the gun after each firing, and turned gently round to discover the cavities within: if any are found, they are marked on the outside with chalk; and then the

Searcher with one point is introduced; about which point a mixture of wax and tallow is put, to take the impression of the holes; and if any are found of one-fourth of an inch deep, or of any considerable length, the gun is rejected as unserviceable to the government.

Reliever, is an iron ring fixed to a handle, by means of a socket, so as to be at right angles; it serves to disengage the first searcher, when any of its points are retained in a hole, and cannot otherwise be got out. When guns are rejected by the proof-masters, they order them to be marked X thus, which the contractors generally alter WP thus; and after such alteration, dispose of them to foreign powers for Woolwich proof.

The most curious instrument for finding the principal defects in pieces of artillery, was lately invented by lieutenant-general Defaguliers, of the royal regiment of artillery. This instrument, grounded on the truest mechanical principles, is no sooner introduced into the hollow cylinder of the gun, than it discovers its defects, and more particularly that of the piece not being truly bored; which is a very important one, and to which most of the disasters happening to pieces of artillery are in a great measure to be imputed; for, when a gun is not truly bored, the most expert artilleryist will not be able to make a good shot.

Proof of Mortars and Howitzers, is made to ascertain their being well cast, and of strength to resist the effort of their charge. For this purpose the mortar or howitzer is placed upon the ground, with some part of their trunnions or breech sunk below the surface, and resting on wooden billets, at an elevation of about 70 degrees.

The mirror is generally the only instrument to discover the defects in mortars and howitzers. In order to use it, the sun must shine; the breech must be placed towards the sun, and the glass over-against the mouth of the piece: it illuminates the bore and chamber sufficiently to discover the flaws in it.

Proof of Foreign Brass Artillery. 1st, The Prussians. Their battering-train and garrison artillery are proved with a quantity of powder equal to ½ the weight of the shot, and fired 75 rounds as fast as in real service; that is, 2 or 3 rounds in a minute. Their light field-train, from a 12-pounder upwards, are proved with a quantity of powder = 1-3d of the weight of the shot, and fired 150 rounds, at 3 or 4 rounds in a minute. From a 12-pounder downwards, are proved with a quantity of powder = 1-5th of the shot's weight, and fired 300 rounds, at 5 or 6 rounds each minute, properly spunged and loaded. Their mortars are proved with the chambers full of powder, and the shells loaded. Three rounds are fired as quick as possible.

2d, The Dutch prove all their artillery by firing each

Proof,
Propaga-
tion.

each piece 5 times; the two first rounds with a quantity of powder = 2-3ds of the weight of the shot; and the three last rounds with a quantity of powder = $\frac{1}{4}$ the weight of the shot.

3d, The French the same as the Dutch.

PROOF, in brandy and other spirituous liquors, is a little white lather which appears on the top of the liquor when poured into a glass. This lather, as it diminishes, forms itself into a circle called by the French the *chapelet*, and by the English the *bead* or *bubble*.

Nichols's
Life of Ho-
garth.

PROOFS of Prints, were anciently a few impressions taken off in the course of an engraver's process. He proved a plate in different states, that he might ascertain how far his labours had been successful, and when they were complete. The excellence of such early impressions, worked with care, and under the artist's eye, occasioning them to be greedily sought after, and liberally paid for, it has been customary among our modern print-sellers to take off a number of them amounting, perhaps to hundreds, from every plate of considerable value; and yet their want of rareness has by no means abated their price. On retouching a plate, it has been also usual, among the same conscientious fraternity, to cover the inscription, which was immediately added after the first proofs were obtained, with slips of paper, that a number of secondary proofs might also be created.

PROOF, in the sugar trade. See SUGAR.

PROOFS, in printing. See PRINTING, p. 524, col. 2.

PROPAGATION, the act of multiplying the kind. See GENERATION.

PROPAGATION of Plants. The most natural and the most universal way of propagating plants is by seeds. See PLANTS, and NATURAL HISTORY, p. 654. But they may also be propagated by *sets*, *pieces*, or *cuttings*, taken from the parent plant. Willows are very easily propagated by sets: such as rise to be considerable timber trees being raised from sets 7 or 8 feet long, sharpened at their larger ends, which are thrust into the ground by the sides of ditches, on the banks of rivers, or in any moist soil. The fallow trees are raised from sets only 3 feet long. The plane tree, mint, &c. may be propagated in the same way. In providing the slips, sprigs, or cuttings, however, care must be taken to cut off such branches as have knots or joints 2 or 3 inches beneath them; small top sprigs of 2 or 3 years growth are the best for this operation. Plants are also propagated by parting their roots, each part of which, properly managed, sends out fresh roots. Another mode of propagating plants is by layering or laying the tops of the branches in the ground.

The method of layering is this: Dig a ring-trench round the stool, of a depth suitable to the nature of the plant; and having pitched upon the shoots to be layered, bend them to the bottom of the trench (either with or without plashing, as may be found most convenient), and there *peg* them fast; or, putting some mould upon them, *tread* them hard enough to prevent their springing up again—fill in the mould—place the top of the layer in an upright posture, treading the mould hard behind it; and cut it carefully off above the first, second, or third eye. Plants are also propagated by their bulbs.

The number of vegetables that may be propagated from an individual is very remarkable, especially in the most minute plants. The annual product of one seed

even of the common mallow has been found to be no less than 200,000; but it has been since proved, by a strict examination into the more minute parts of the vegetable world, that so despised a plant as the common wall moss produces a much more numerous offspring. In one of the little heads of this plant there have been counted 13×24 seeds. Now allotting to a root of this plant eight branches, and to each branch six heads, which appears to be a very moderate computation, the produce of one seed is $6 \times 13824 = 82944$; and 8×82944 , gives 663,552 seeds as the annual produce of one seed, and that so small that 13824 of them are contained in a capsule, whose length is but one ninth of an inch, its diameter but one 23d of an inch, and its weight but the 13th part of a grain.
